ENCYCLOPÆDIA BRITANNICA

SEVENTH EDITION.

THE

ENCYCLOPÆDIA BRITANNICA

OR

DICTIONARY

OF

ARTS, SCIENCES, AND GENERAL LITERATURE.

SEVENTH EDITION,

WITH PRELIMINARY DISSERTATIONS ON THE HISTORY OF THE SCIENCES,

AND

OTHER EXTENSIVE IMPROVEMENTS AND ADDITIONS;

INCLUDING THE LATE SUPPLEMENT.

A GENERAL INDEX,

AND NUMEROUS ENGRAVINGS.

VOLUME XIII.

ADAM AND CHARLES BLACK, EDINBURGH;

M.DCCC.XLII.

ENCYCLOPÆDIA BRITANNICA.

L.

L, A SEMI-VOWEL, or liquid, forming the eleventh letter of the alphabet. It is derived from the old Hebrew lamed, or Greek lambda λ. It is sounded by intercepting the breath between the tip of the tongue and the fore part of the palate, with the mouth open, and makes a sweet sound, with something of an aspiration; hence the Britons and Spaniards usually doubled it, or added an *h* to it, in the beginning of words, as in *llan*, or *lhan*, a temple, sounding nearly like *fl*. In English words of one syllable it is doubled at the end, as *tell, bell, knell;* but in words of more syllables than one it is single at the end, as *evil, general, constitutional.* It is placed after most of the consonants in the beginning of words and syllables, as *black, glare, adle, eagle,* but before none. Its sound is clear in *Abel*, but obscure in *able*, and the like.

As a numeral letter, L denotes 50; and with a dash over it, thus, $\overline{L}$, 5000. Used as an abbreviation, this letter stands for Lucius; whilst L. L. S. represents a sesterce. (See SESTERCE.) LA is the syllable by which Guido denotes the last sound of each hexachord. If it begins in C, it answers to our A; if in G, to E; and if in F, to D.

LAALAND, an island in the Baltic Sea, being one of the portions of the kingdom of Denmark. It extends in north latitude from 54. 38. 30. to 54. 57. 30., and in east longitude from 10. 53. 1. to 11. 46. 2. and contains 470 square miles. It comprehends five cities or towns, and sixty-nine parishes, with 42,700 inhabitants. The soil is of moderate fertility, but the whole industry being applied to agriculture, it yields a surplus of corn, butter, meal, flax, honey, and wax. The land communication with the capital is over the island of Falster. The roads are in a most miserable condition.

LAARAT ISLE is situated off the north-eastern extremity of Timorlaut, in the Eastern Seas. It is about twenty-five miles in length by twelve in average breadth. Little is known, however, respecting its inhabitants or its productions.

LABADIE, JOHN, a French enthusiast, son of John Charles Labadie, governor of Bourges and gentleman in ordinary of the bed-chamber to the French king, was born in 1610. He entered young into the Jesuits' College at Bordeaux, which, by his own account, he afterwards quitted; but, according to others, he was expelled from it for his peculiar notions, and particularly for hypocrisy. He became a popular preacher; but being repeatedly detected in working upon female devotees with spiritual instructions for improper purposes, his loss of character with the Catholics forced him to seek for refuge amongst the Protestants. A reformed Jesuit being thought a great acquisition, he was precipitately accepted as pastor of Montauban, where he officiated for eight years; but having attempted the chastity of a young lady whom he could not convert to his purpose, and quarrelled with the Catholic priest about the right of interring a dead body, he was at length banished from that place. Driven out of Montauban, Labadie went to seek an asylum at Orange; but not finding himself so safe there as he imagined, he withdrew privately to Geneva, where he imposed on the people by his zealous preaching and devout carriage. From Geneva he proceeded to Middleburg, where his spirituality made him and his followers be considered as so many saints, and distinguished by the name of *Labadists.* They increased so much, that he excited the attention of the other churches, whose authority he disputed, till he was formally deposed by the synod of Dordrecht. But instead of obeying, he procured a tumultuous support from a crowd of his devotees; and at length formed a little settlement between Utrecht and Amsterdam, where he erected a printing press, which sent forth many of his works. He was, however, betrayed by some deserters, who exposed his private life, informing the public of his familiarities with his female disciples, under pretence of uniting them more particularly to God; and he was finally obliged to retire to Altona, where he died in 1674.

LABADISTS, a sect of religionists in the seventeenth century, followers of the opinions of John Labadie. Some of their opinions were, that God could, and did, deceive men; that, in reading the Scriptures, greater attention should be paid to the internal inspiration of the Holy Spirit than to the words of the text; that baptism ought to be deferred until mature age; that the good and the wicked entered equally into the old alliance, provided they descended from Abraham, but that the new admitted only spiritual men; that the observation of Sunday was a matter of indifference; that Christ would come and reign a thousand years upon earth; that the eucharist was only a commemoration of the death of Christ, and that, though the symbols were nothing in themselves, yet that Christ was spiritually received by those who partook of them in a due manner; that a contemplative life was a state of grace and of divine union during this life; that the man whose heart is perfectly content and calm, half enjoys God, has familiar entertainments with him, and sees all things in him; and that this state was to be come at by an entire self-abnegation, by the mortification of the senses and their objects, and by the exercise of mental prayer.

LABARUM, the banner or standard borne before the Roman emperors in the wars. The *labarum* consisted of a long lance, with a staff on the top, crossing it at right angles, from which hung a rich streamer, of a purple colour, adorned with precious stones. Till the time of Constantine it had an eagle painted on it; but, instead of this, that emperor added a cross, with a cipher expressing the name of Jesus. This standard the Romans took from the Germans, Dacæ, Sarmatæ, Pannonians, and other Teutonic tribes, whom they had overcome. The name of *labarum* was not known before the time of Constantine; but the standard itself, in the form we have described it, except the symbols of Christianity, was used by all the preceding emperors. Some derive the word from *labor*, as if this finished their labours; some from ἐυλαϐεια, *reverence, piety*; others from λαμϐανειν, *to take*; and others from λαφυϱα, *spoils*.

LABAT, John Baptist, a celebrated traveller, of the order of St Dominic, was born at Paris in 1663, taught philosophy at Nancy, and, in 1693, went to America in the quality of missionary. On his return to France in 1705, he was sent to the chapter of his order at Bologna to give an account of his mission, and resided several years in Italy. He died at Paris in 1738. His principal works are, 1. Nouveaux Voyages aux Iles de l'Amérique, in six vols. 8vo; 2. Voyages en Espagne et en Italie, in eight vols. 12mo; 3. Nouvelle Relation de l'Afrique Occidentale, in five vols. 12mo; 4. Voyage du Chevalier des Merchais en Guinée, in four vols. 12mo; 5. La Relation Historique de l'Ethiopie Occidentale, translated from the Latin of Father Cavazzi, in four vols. 12mo; 6. Les Mémoires du Chevalier d'Arvieux, containing his Travels to Constantinople and Asia Minor, in six vols. 12mo.

LABEL, a long, thin, brass rule, with a small sight at one end, and a hole at the other, commonly used with a tangent line on the edge of a circumferentor.

Label, in *Law*, is a narrow slip of paper, or parchment, affixed to a deed or writing, to hold the appending seal. Any paper annexed by way of addition or explication, to any will or testament, is also called a label or codicil.

Label, in *Heraldry*, a fillet usually placed in the middle along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief. It is adorned with pendants, and when there are above three of these, the number should be specified in blazoning. It is used on the arms of eldest sons whilst the father is alive, to distinguish them from the younger; and is esteemed the most honourable of all differences.

LABEO, C. Antistius, a celebrated lawyer of the age of Augustus and Tiberius, was son of Antistius Labeo, who formed one of the conspiracy against Cæsar, and, after the unsuccessful battle of Philippi, caused himself to be put to death by one of his own slaves. His son seems to have inherited all the independent principles of the father, and to have expressed at times his opinions respecting the measures of Augustus with such freedom, that it was thought by his friends that he was subject to fits of insanity. (Hor. *Sat.* i. 3, 82; Suet. *Aug.* 54.) Some say that he was offered the consulship by Augustus, but that he refused the honour, lest he should be suspected of having sold his independence to the emperor. Others say that he was a candidate for the consulship, and that Augustus caused M. Ateius Capito to be elected in preference to him. (Tacit. *Ann.* iii. 75.) He had applied himself more particularly to the study of law, and left many works, of which scarcely any thing remains except the title; eight books on *Probabilities*, of which Julius Paulus made an abridgment; a work in forty-two books, entitled *Posteriores*, because it appeared after his death. Of these two works fragments are to be found in the pandects of Justinian. The latter is abridged by Jabolenus, who flourished under Trajan. (Gell. xiii. 10.) His other works are, Commentaries on the Twelve Tables, and on the Edicts of the Prætor and Curile Æediles; a Treatise on the Prætor Urbanus and Peregrinus; a Treatise on Pontifical Law, in fifteen books. It is disputed whether some other works mentioned by St Augustin belong to this Labeo, or to another of the same name. (See *Opuscula varia* of Bynkershöck, Leyd. 1719; *De Vita, Moribus, et Studiis Labeonis et Capitonia*, Utrecht, 1692.)

LABERIUS, Decimus, a Roman knight, who was particularly distinguished as a writer of mimi, that is, farces in the language of the common people, and for their amusement. The exact period of his birth is unknown, but he died B. C. 43, a few months after the murder of Cæsar. Having caused some annoyance to the dictator by the freedom of his language, he was ordered by him to appear on the stage as an actor in one of his own plays, when he had reached the age of sixty. The prologue which he pronounced on this occasion is preserved by Macrobius (*Sat.* ii. 7), and is so beautiful that it makes us regret that more of his writings have not come down to us. When he had finished, he proceeded towards the places assigned to the knights; but his appearance on the stage had deprived him of all the privileges enjoyed by that order, and no one was willing to make way for him. Cicero, observing his embarrassment, said, in allusion to the number of new senators admitted by Cæsar, "Recepissem te nisi anguste sederem;" upon which Laberius sarcastically replied, "Mirum si anguste sedes qui soles duabus sellis sedere," thereby reproaching Cicero with his versatility of conduct. We have the titles of forty of his pieces (see Fabricius, *Biblioth. Lat.* i. p. 477), but only a few fragments of them have been preserved. They have been published by Stephanus, Paris, 1564; and are also found in the *Catalecta veterum Poetarum* by Scaliger, and in the *Epigrammata vetera*, Lyons, 1596.

LABIAL Letters, those pronounced chiefly by means of the lips.

LABIAU, a city of East Prussia, in the government of Königsberg, the capital of a circle of the same name. It stands on the river Deine, and is connected by a canal with the Pregel. It is fortified, and contains 290 houses, with 2630 inhabitants, who export considerable quantities of tallow and of linseed. Long. 21. 1. 25. E. Lat. 54. 51. 20. N.

LABOOAN, an island off the north-west coast of Borneo, to which the English retired in 1775, when they were expelled by the Sooloos from Balambangan. Long. 115. E. Lat. 5. 20. N.

LABORATORY, the chemist's workhouse, or the place where furnaces are built, vessels kept, and operations performed. In general the term *laboratory* is applied to any place where physical experiments in pharmacy, chemistry, pyrotechny, and the like, are performed. See Chemistry.

Laboratory, in military affairs, signifies that place where all sorts of fire-works are prepared, both for actual service and for experiments, viz. quick matches, fuzes, port-fires, grape-shot, case-shot, carcasses, hand-grenades, cartridges, shells filled, and fuzes fixed, wads, &c.

LABOUREUR, JOHN LE, almoner to the king of France, and prior of Juvigne, was born at Montmorency, near Paris, in 1623. At the age of eighteen he distinguished himself by publishing a Collection of the Monuments of Illustrious Persons buried in the church of the Celestines at Paris, with their elegies, genealogies, arms, and mottos, in 4to. He afterwards published an edition of the Memoirs of Michel de Castelneau, with several other genealogical histories. He had a brother, Louis le Laboureur, bailiff of Montmorency, author of several pieces of poetry; and an uncle, Dome Claude le Laboureur, provost of the abbey of L'Isle Barbe, of which he wrote a history, and published notes and corrections on the breviary of Lyons. Laboureur died in 1675.

LABRADOR, a vast region of North America, nearly of a triangular shape, extending from the fiftieth to the sixty-first degree of north latitude, and from fifty-six to seventy-eight of west longitude. It is bounded on the south by Canada and the Gulf of St Lawrence, on the east by the Atlantic Ocean, on the north by Hudson's Straits, and on the west by Hudson's Bay. Being thus detached from the arctic lands, Labrador ought to partake in some degree of the nature of the temperate cold regions; but, from causes which do not appear to be very obvious, it is a country as frozen, desolate, and barren, as those to the west of Hudson's Bay. The coast along that spacious inland sea is called East Main, and the climate there is peculiarly rigorous. The whole surface of Labrador, indeed, is as sterile and naked as any part of the globe. The prevailing features are rocks, swamps, and water; and vegetation appears as the last effort of expiring nature. Small scraggy poplars, stunted firs, creeping birch, and dwarf willows, thinly scattered in the southern parts, constitute the whole of the trees; herbs and grass are also in sheltered places to be met with; but in the most northerly parts only varieties of moss and lichens are to be found. The whole of the interior, from the aspect of what has been explored, and from the reports of the Esquimaux and other Indians, seems to be broken up with rivers, lakes, and rocks. The geological features of the Labrador coast are as follow:[1]—The prevailing rock contiguous to the sea shore is gneiss. On this, at L'Anse à Loup, the most fertile part of the country, a bed of old red sandstone, about two hundred feet thick, is superimposed, and extends about half a mile inland. Here also, as on every other part of the coast visited by the individual from whom our information is derived, the appearances of the cliffs and of the land near them, and the rolled masses inland, which have evidently been exposed to the action of the sea, seem to prove that the latter has considerably receded. The sandstone is generally red and white in alternate strips, and presents a remarkable mural front to the sea. Near the surface it was strongly marked with iron. The whole of the rock was composed of white quartz and yellow felspar; and the grains were generally as fine as oatmeal, though occasionally coarser, even to the extent of half an inch in diameter. Over the red sandstone was a thin stratum of red compact felspar, containing vegetable impressions, and also horizontal. Above this were varieties of secondary limestone arranged in parallel strata several feet thick and full of shells. Detached masses of primitive limestone were also found; and, a few miles from the shore, the secondary formations generally disappeared, leaving gneiss and mica slate on the surface. North of Cape Charles, on the Labrador coast, the land falls back to the westward, and the shore changes its character, becoming shoal, and running off in flats; whereas to the southward it is bold and abrupt. The prevailing rock, however, is still gneiss, containing numerous veins of granite, from a few inches to many feet in thickness, the constituent parts being mica, quartz, and felspar. The diameter and dip of the gneiss rock is here, as elsewhere on the coast, to the north-west, and at an angle of nearly 65°. It is coarse and dark, hornblende taking the place of mica, and frequently very light-grayish felspar forming the chief constituent. Where this occurs, the face of the hill has a remarkably spotted appearance. On one of the islands which here skirt the coast, a large bed of primitive greenstone was found, forming a range of hills resting on the gneiss, and appearing to have the same direction. On the western part of these islands also the gneiss gives place to mica slate, this commencing beyond the above-mentioned range of greenstone, which appears to mark the line of demarcation between them. The mica slate then predominates through all the islands and shores examined to the westward of this point, viz. to the Mealy Mountains, in Sandwich Bay, a distance of about thirty-five miles. In some places crystals of garnet are very abundant in it, and in others considerable beds of granite were found, of a confused appearance, and in which quartz and felspar predominated. The Mealy Mountains are the highest land on this coast, and were computed to be about 1484 feet in height, covered nearly to the top with wood, notwithstanding the severity of the climate. They are of mica slate, with a dark, fine-grained formation of the same, resembling basalt, at their base. The general rock is coarse-grained. At the foot of these mountains were also found beds eight and ten feet thick, and large rolled masses of a remarkable conglomerate rock, of which the basis was composed of grains of mica, quartz, and felspar; and the imbedded masses were large rounded pebbles of quartz, mica slate, felspar, hornblende, granite, and gneiss. The whole was very hard, and elicited sparks of fire under the stroke of the hammer. The imbedded fragments were all water-worn.

The general aspect of different parts of the Labrador coast has been described by the Moravian missionaries, from whom we learn that Nullatarlok Bay, in 59° north latitude, is surrounded by high mountains, which are covered with moss, alder, birch, and various shrubs and plants, the valleys in July being grassy and enamelled with a great variety of flowers. The rocks are slaty, easily splitting into plates of from four to eight feet square. At Nachvak Bay the sea was clear of ice in the middle of July, and the magnificent mountains around afforded to the missionaries a most enchanting prospect. Oppernavik, lying between the sixtieth and sixty-first degrees of north latitude, is not far distant from Cape Chudleigh, where the coast, which was hitherto north, now trends to the south-south-west, embosoming a spacious expanse of water called Ungava Bay. The river Kangertluksoak, in latitude 58. 57. north, is about 140 miles south-south-west of Cape Chudleigh. The estuary of the Koksoak lies in 58. 36. north latitude, at the distance of about 650 miles from the Moravian station Okkak, and is as broad as the Thames at Gravesend. Up the river there is a bay surrounded on all sides by gently rising ground, well wooded with trees of moderate size. For about half a mile a fine slope extends, bounded on each extremity by a hill. The Moravians describe the land as level and dry, watered by rivulets issuing from the woods, in which were found various European plants and flowers, different kinds of shrubs, such as junipers, currants, and the like, and grass and trees in abundance. The missionaries were informed that, further west, no wood grows along the coast. The soil at L'Anse à Loup is rich, and it is much the most eligible part of Labrador for settlers. Corn will not ripen, but serves for green food; and potatoes, cabbages, lettuce, spinach, and early Dutch turnips, do well. There is generally much rain on the whole coast, but now the temperature would appear to be more equable than it was some fifty years ago, if we may trust to the correctness of the reports of navigators. The current always sets to the southward along the coast. The tides rise six feet to the northward, and about four to the southward. The prevailing winds are from west-south-west to north-west. There is less fog than farther south; and the Straits of Belleisle, which separate Newfoundland from Labrador and the continent of America, are never frozen over.

---

[1] For this account of the geology of Labrador, we are indebted to a paper by Captain H. Robinson, R. N. published in the Journal of the Royal Geographical Society of London, 1834.

On the coast of Labrador the winter is extremely severe, the thermometer often falling thirty degrees below the freezing point; and although the houses of the Moravian missionaries are heated by large cast-iron stoves, the windows and walls are all the winter covered with ice, and the bed-clothes freeze to the walls. Rum is frozen in the air as rapidly as water, and rectified spirits soon become thick like oil. From December to June the sea is completely frozen over; and so intense is the cold during the winter months, that travelling is sometimes attended with the most painful consequences. The summer months, again, are extremely hot along the coast, the thermometer rising to eighty-six degrees of Fahrenheit, when swarms of musquitoes infest the air. The climate, however, is not insalubrious; and, notwithstanding all its disadvantages, Labrador is of considerable importance to Great Britain. No country is better provided with large, convenient, and safe harbours, or supplied with better water; and vast multitudes of all those kinds of fish common to the arctic seas abound on the coast. Herrings are very fine and plentiful in August, but there is no weather to cure any kind of fish after the 10th of September. The rivers are frequented by salmon and sea trout; and pike, barbel, eels, river trout, and the like, are likewise found in them. On the numerous islands which are scattered along the east coast, multitudes of eider-ducks and other water-fowl breed. Those of large size have deer, foxes, and hares, upon them. On the continent the wild animals are principally bears, wolves, foxes, and otters; beavers and deer are not numerous, but their furs are remarkably close and beautiful. The birds of the country are the white-tailed eagle, falcons, hawks, and owls of various kinds; raven, white grouse, ptarmigan, spruce-game, whistling curlew, gray plover, various kinds of sand-pipers and other waders; geese, ducks of various sorts, shags, gulls, divers, and some few species of small birds. During the short summer, insects are very numerous, especially in swampy places. In winter they exist in a state of torpidity, from which they are aroused by the solar heat or artificial warmth. The phenomenon of the aurora borealis is uncommonly brilliant in this region, and exercises a very marked influence over the compass.

The exports of Labrador consist of the products of the country, fish, oil, and fur. During the fishing season, from 280 to 300 schooners proceed from Newfoundland to the different fishing stations on the coast, where about 20,000 British subjects are employed for the season. About one third of these vessels make two voyages, loaded with dry fish, back to Newfoundland, during the summer; and several merchant vessels proceed from Labrador with their cargoes direct to Europe, leaving generally full cargoes for the fishing vessels to carry to Newfoundland. A considerable part of the fish of the second voyage is in a green or pickled state, and dried afterwards at Newfoundland. Quebec sends eight or nine vessels to the coast, manned with eighty or one hundred fishermen. Part of the fish caught by them is sent to Europe, and the remainder is carried to Quebec; besides which, they carry annually about L.6000 worth of furs, oil, and salmon to Canada. From one hundred to one hundred and twenty vessels come from Nova Scotia and New Brunswick. The principal part of their cargoes goes home in a green state. From 16,000 to 18,000 seals are taken at Labrador in the beginning of winter and spring. They are of a very large size, and the winter residents on the coast are said to feast and fatten on their flesh, which, when young, they account excellent eating. About 4000 of these seals are killed by the Esquimaux. The whole number caught produce about 350 tons of oil, the value of which may be about L.8000. One third of the resident inhabitants are British servants, who take charge of the property left, and likewise employ themselves, in the spring and fall, catching seals. The other two thirds live constantly at Labrador, and act in the capacity of furriers and seal catchers on their own account, but chiefly as the former during the winter; in summer all are engaged in the fisheries. Half of these individuals are Jerseymen and Canadians, most of whom have families. There are six or seven English houses, and four or five Jersey houses, established at Labrador, unconnected with Newfoundland, who export their oil and fish directly to Europe. The quantity exported to the Mediterranean in 1830 was about

50,000 quintals cod fish, at 10s	L.25,000
900 tierces salmon, at 60s	2,700
To England, about 200 tons cod oil	4,000
200 do. seal do	4,500
Furs	3,000
	L.39,200
By Newfoundland houses, 20,000 quintals cod fish, at 10s	10,000
300 tierces salmon, at 60s	900
Total direct export from Labrador	L.50,100
Produce sent direct to Newfoundland from Labrador:	
24,000 quintals cod fish, 9s. best quality	10,800
300,000 quintals cod fish	127,500
1500 tuns cod oil, at L.18	27,000
Salmon, &c	3,000
Fish, &c. sent to Canada, about	10,000
Ditto carried to Nova Scotia and New Brunswick, should be in value at least	50,000
Estimated value of the produce of Labrador, exclusive of what the Moravians send to London[1]	L.278,400

The Labrador fishery has, since 1814, increased more than sixfold, principally in consequence of our fishermen being driven from the grounds now occupied by the French.[1]

---

[1] These statements are made at the most depressed prices, and not at the average prices, which would increase the gross value to L.312,400. The Americans of the United States had, in 1829, about 500 vessels and 15,000 men employed on the coast, and their "catch" amounted to 1,100,000 quintals of fish, and about 3000 tuns of oil; value altogether, about L.610,000.

This vast country, equal in square miles to France, Spain, and Germany, has not a resident population exceeding 4000 inhabitants, including the natives and Moravians. The latter, an excellent and truly Christian people, have several settlements on this stern, inhospitable shore; and nothing but the purest spirit of religion and philanthropy could induce them to remain, and zealously labour to enlighten the miserable and disgusting native population. The principal station is at Nain, on the north shore, where a ship annually arrives from London in July, laden with provisions and other necessaries. At Nain there are four missionaries, at Okkak three missionaries, at Hebron five missionaries, and at Hopedale four missionaries. The total number of brethren is twenty-nine; and there are 895 Esquimaux converts to Christianity, of whom about 320 are communicants. These Moravians appear to have come from Greenland about the middle of the last century, in the prosecution of their pious undertaking to enlighten the heathen. Their habits and mode of life are simple and quiet, corresponding to their isolated condition. Their trade is wholly with the Esquimaux, with whom they barter coarse cloths, powder, shot, guns, and edge-tools, for furs, oils, and other articles, the produce of the country. The Esquimaux, the most filthy and disgusting tribe yet discovered on the shores of America, are thinly scattered along the coast of Labrador. The greatest number of them in any one place appears to be at Invutoke Inlet, or Esquimaux Bay, on the Atlantic coast of Labrador, where there are about two hundred and fifty. (For a description of the Esquimaux, see the article GREENLAND). The Canadians and others residing at Labrador employ these people in catching fish, and the like. Labrador belongs to the government of Newfoundland. During summer there is a court held, from which appeals are made to the supreme court of St John's. An armed vessel visits, and continues generally along the coast, during the greater part of the fishing season. (R. R. R.)

LABRUM, in *Antiquity*, a great tub which stood at the entrance of the temples, containing water for the priests to wash in previously to their offering sacrifices. It was also the name of a tub used in the baths of the ancients.

LABY, or LABBE', one of the principal cities of the Foolah kingdom of Foota Jallou, in Western Africa. It is distant about seventy-two miles from Teembo, the capital, and contains about 5000 inhabitants, who carry on a considerable traffic with various towns on the river Nunez.

LABYRINTH, amongst the ancients, was a large, intricate edifice, cut out into various aisles and meanders running into one another, so as to render it difficult to find a passage through them. Mention is made of several of those edifices amongst the ancients; but the most celebrated were the Egyptian and Cretan labyrinths. That of Egypt, according to Pliny, was the oldest of all the known labyrinths, and subsisted in his time, after having stood three thousand six hundred years. According to him, it was built by King Petesucus, or Tithoes; but Herodotus makes it the work of several kings. It consisted of twelve large contiguous palaces, containing three thousand chambers, fifteen hundred of which were under ground. Strabo, Diodorus Siculus, Pliny, and Mela, speak of this monument with the same admiration as Herodotus; but not one of them tells us that it was so constructed as to bewilder those who attempted to explore it; although it is manifest that, without a guide, they who entered it would be in danger of losing their way. It was this danger, no doubt, which introduced a new term into the Greek language. The word *labyrinth*, taken in the literal sense, signifies a circumscribed space, intersected by a number of passages, some of which cross each other in every direction like those in quarries and mines, whilst others make larger or smaller circuits round the place from which they depart, like the spiral lines we see on certain shells. In the figurative sense, it was applied to obscure and captious questions, to indirect and ambiguous answers, and to those discussions which, after long digressions, bring us back to the point from which we had set out. The Cretan labyrinth is the most famous in history or fable, having been rendered particularly remarkable by the story of the Minotaur, and of Theseus, who found his way through all its windings by means of Ariadne's clue. Diodorus Siculus relates as a conjecture, and Pliny as a certain fact, that Dædalus constructed this labyrinth on the model of that of Egypt, though on a smaller scale. It was formed by the command of Minos, who kept the Minotaur shut up in it; but in their time it no longer existed, having been either destroyed by time, or purposely demolished. Diodorus Siculus and Pliny, therefore, considered this labyrinth as a large edifice; whilst other writers represent it simply as a cavern hollowed in the rock, and full of winding passages. The opinion of Diodorus and Pliny supposes that in their time no traces of the labyrinth existed in Crete, and that even the date of its destruction had been forgotten. Yet it is said to have been visited by the disciples of Apollonius of Tyana, who was contemporary with these authors. At that time, therefore, the Cretans believed that they possessed the labyrinth.

LAC OF RUPEES, is a hundred thousand rupees, which, supposing them standard, or siccas, at 2s. 6d., amounts to L.12,500 sterling.

LACCA, LAC, or *Gum-Lac*, is a substance out of which a species of insects form cells upon trees, like honeycombs. In these cells remain some of the dead insects, which give a red colour to the whole substance of the lac. That called *stick-lac* is the wax which adheres to some of the small branches of the tree, and is unprepared. This lac, when separated from the adhering sticks, and grossly powdered, and deprived of its colour by digestion with menstruums for the sake of the dyes and other purposes, is called *seed-lac*, which, when freed from impurities by melting it over a gentle fire, and formed into cakes, is called *lump-lack;* and, lastly, that called *shell-lac* consists of the cells liquefied, strained, and formed into thin transparent laminæ.

Artificial LACCA, or *Lacque*, is also a name given to a coloured substance obtained from several flowers, as the yellow from the flower of the juniper, the red from the poppy, and the blue from the iris or violet. The tinctures of these flowers are extracted by digesting them several times in aqua vitæ, or by boiling them over a stove fire in a lixivium of potashes and alum.

LACCADIVES, an archipelago of low islands lying off the Malabar or western coast of India, between the 8th and 13th degrees of north latitude. There are nineteen considerable ones; but as most of them are surrounded with reefs and steep rocks, with a great depth of water close to them, the approach to them is very dangerous. Between these islands there are many channels, through which ships from India, bound to Persia or Arabia, frequently sail. The safest of these is called Mamale, or the Nine-degree Channel, which runs between the islands of Seuhilipar and Kalpenny. The largest of these islands is about seven miles in length and two and a half in breadth. Most of them are inhabited by a race of Mahommedans called Moplays. They do not yield grain, but produce an infinite quantity of cocoa nuts, from the husks of which they form the *coir* cables, which are more elastic and durable than hemp, as the sea-water, instead of rotting, preserves them. These islands are well supplied with fish, and carry on a trade with the small shells called *cowries*, which pass as coin all over India. They are nominally dependent on Cannanore, but their poverty has been always their chief security. They were discovered by Vasco de Gama in 1499, but have since been little frequented by Europeans.

---

[1] M'Gregor's *British America*, vol. i. p. 209; to which work we are indebted for the above facts relative to the trade of Labrador.

LACE, from *lacinia*, the guard hem or fringe of a garment, is a plain or ornamented network, consisting of threads of gold, silver, silk, flax, or cotton, tastefully interwoven so as to form a beautiful texture. This delicate fabric has no doubt claims to high antiquity, but its origin is involved in considerable obscurity. That it was worn by Grecian females is certain, and the derivation of the word *lace* affords presumptive evidence that it was also in use amongst the Romans. In Venice, and the neighbouring states of Italy, it was very early worn; and Mary of Medicis is supposed to have been the first who introduced its use into France; but as early as 1483 we find it included in a list of articles prohibited to be imported into England. The inference which may be drawn from this circumstance is, that it had begun to be made in this country *prior* to the period above mentioned, and that this prohibition, like many other subsequent acts, was for the protection and encouragement of home manufactures. But *pins*, which are indispensable in the process of lace-making, were not known till long afterwards; so that it is probable the fabric made was neither very fine in texture, nor produced to any great extent. It is uncertain by whom the manufacture of lace was originally introduced into this country, nor is it of great importance to know. About the middle of the seventeenth century, the lace trade was a flourishing concern in Buckinghamshire; and so greatly had it advanced in England, that, by a royal ordonnance in France, passed in 1660, a mark was established upon the thread lace imported from this country and from Flanders, and upon point-lace from Genoa, Venice, and other countries.

Pillow-lace, the original manufacture, is worked upon a hard-stuffed pillow, with silk, flax, or cotton threads, according to a parchment pattern placed upon it, by means of pins, bobbins, and spindles, which are placed and displaced, twisting and interweaving the threads, so as to imitate the pattern designed. This manufacture has been long pursued in many counties in England, and at various places on the Continent. Of the number of persons employed on the Continent no estimate can be formed; but at Brussels alone no less than 10,000 individuals are said to be engaged in the manufacture. It is supposed that the first lace ever made in this country was that called Brussels point, in which the network is made by bone bobbins on the pillow, and the pattern and sprigs are worked with the needle. This, from different portraits now in existence, appears to have been the kind worn in the time of Charles I. and during the reigns of several subsequent sovereigns. Various improvements have from time to time taken place in the manufacture of this article; but, about the year 1778, the point-ground was introduced by the inhabitants of Buckingham and its neighbourhood, which quickly superseded all the others. The origin of the modern pillow-lace may be dated from this period; but the most striking improvements did not take place till the commencement of the present century, and since then, for several years, they were astonishing and unprecedented. During the war, veils of this lace sold at a very high rate; but their value has been greatly depreciated by the introduction of the new manufacture, which is the product of machinery. Since 1815, the competition in this article has been very great, and the manufacture of pillow-lace has consequently declined so much as to be now in a very languishing condition.

The first who made lace by machinery was a frame-work knitter of Nottingham, about the year 1768. This individual employed his common stocking-frame in the manufacture; but, about the same time, another person in the same place introduced a machine ostensibly for lace, called a pin-machine. Single-press *point-net*, in imitation of the Brussels ground, was the article produced. In 1782 the warp-frame was introduced, and is still in use for making warp-lace. In 1809, Mr Heathcoat of Tiverton succeeded in discovering the correct principle of the bobbin-net frame, and obtained a patent for fourteen years for his invention. The expiration of this patent, combined with the application of steam-power, which had now become general, gave a great stimulus to the trade. The demand became immense, and prices fell in proportion as production increased. The Nottingham lace-frame became the organ of general supply, rivalling and supplanting in plain nets the most finished productions of France and the Netherlands. In a work relative to this manufacture, published in 1833, the state of the trade is given as follows:

Total capital employed in the trade.......	L.1,932,000
Total number of hands employed.............	159,300

The annual produce in 1831 was estimated at 23,400,000 square yards, worth L.1,891,875. In 1834, above 7,000,000 square yards more were annually produced, an increase which is understood to have arisen from the new and improved machinery introduced into the manufacture. A considerable increase has also taken place in bobbin-net machinery on the Continent, particularly at Calais, where, in 1823, there were not thirty-five machines, and probably not one hundred on the Continent altogether. According to the authority above mentioned, there are now above 700 machines at Calais alone; and the total number on the Continent has been estimated at 1850. The produce of these machines has been calculated at 9,824,000 square yards of net, of the value of L.570,250. The manufacture is now beginning to be established in different parts of Europe, where it has hitherto been unknown; and even from some places in Persia orders have been received in this country for bobbin-net frames; but government has restricted the exportation of machinery. The English manufacture from machinery is now confined to *point-net*, *warp-net*, and *bobbin-net*, so called from the peculiar construction of the machines by which they are produced. There were various other descriptions made, but they are now discontinued. Nottingham is the depôt of the lace trade; and the supplies collected from all the surrounding villages, and even from the more distant counties where it is manufactured, are thence distributed to various quarters of the world. The Nottingham trade is by no means in so prosperous a condition as it once was; a result which may probably be attributed to the great influx of capital and hands into the trade, which a successful novelty is at all times calculated to attract. An extraordinary increase in the powers of production followed; and as the demand for some time kept pace with the supply, the latter became a question of *quantity* rather than of *quality*, and a great depression of price was the consequence. From becoming cheap and common, lace lost its attractions in the fashionable circles, and has to a considerable extent been superseded by other kinds of manufacture. The natural result of the increase in power machinery, and the application of speedier machines, is to depress the condition of the workmen, and for some time they have suffered much; nor is any immediate amelioration likely to take place. The following observations on the importance of the trade to Britain are extracted from M'Culloch's *Dictionary of Commerce:* "By comparing the value of 1,270,000 lbs. of Sea Island cotton, worth L.148,000, and about L.10,000 worth of thrown silk, which appears to be annually used in this manufacture, with the manufactured value of the same, worked into 30,771,000 square yards of bobbin-net, the estimated value of which is L.1,850,650, the great national utility of this trade becomes at once evident. A clear surplus of more than a pound sterling is realized upon every pound avoirdupois of the raw material, which is distributed over the trade in rent, profit, and wages; and this is altogether independent of the profits arising from embroidering, in itself a most extensive and important branch. About half, or perhaps three fourths, of this production is supposed to be exported in a plain state, chiefly to Hamburg, the Leipsic and Frankfort fairs, Antwerp and the rest of Belgium, to France (contraband), Italy, Sicily, and North and South America. Of the remainder, three fourths are sold unembroidered, and the remaining fourth embroidered, in this country."

"The most celebrated laces are,—1. Brussels, the most valuable. There are two kinds: Brussels ground, having a hexagon mesh, formed by platting and twisting four threads of flax to a perpendicular line of mesh: Brussels wire ground, made of silk; meshes partly straight and partly arched. The pattern is worked separately, and set on by the needle. 2. Mechlin: a hexagon mesh, formed of three flax threads twisted and platted to a perpendicular line or pillar. The pattern is worked in the net. 3. Valenciennes: an irregular hexagonal, formed of two threads, partly twisted and platted at the top of the mesh. The pattern is worked in the net similar to Mechlin lace. 4. Lisle: a diamond mesh, formed of two threads platted to a pillar. 5. Alençon, called blond: hexagon, of two threads, twisted similar to Buckingham lace; considered the most inferior of any made on the cushion. 6. Alençon point: formed of two threads to a pillar, with octagon and square meshes alternately.

"The French nets made by machinery are,—1. Single-press point, called, when not ornamented, *tulle*, and when ornamented, *dentelle*, made of silk; is an inferior net, but is attractive, from the beautiful manner in which it is stiffened: 2. Trico Berlin; so called from being invented at Berlin, and the stitch being removed three needles from its place of looping; is fanciful and ornamented in appearance, but not in demand in England: 3. *Fleur de Tulle*, made from the warp-lace machine; mesh of two descriptions, which gives a shaded appearance to the net: 4. *Tulle Anglois* is double-pressed point-lace: 5. and 6. Bobbin-net and warp-net, principally made by English emigrants, who have settled in France."

Mr Babbage gives the following account of lace made by the *phœlena pandilla* or caterpillar. The invention is by a gentleman of Munich. He makes a paste of the leaves of the plant which is the usual food of the species of caterpillar he employs, and spreads it thinly over a stone or other flat substance; then, with a camel-hair pencil dipped in olive oil, he draws upon the coating of paste the pattern he wishes the insects to leave open. The stone being placed in an inclined position, a species of caterpillar which spins a strong web is laid at the bottom, and the animals, commencing from that point, eat and spin their way up to the top, carefully avoiding every part touched by the oil, but devouring all the rest of the paste. These veils have not a great deal of strength, but they are surprisingly light. One of them, measuring twenty-six inches and a half by seventeen inches, weighed only 1·51 grain; a degree of lightness which will appear more strongly by contrast with other fabrics. One square yard of the substance of which these veils are made weighs four grains and three fourths, whilst one square yard of silk gauze weighs 137 grains, and one square yard of the finest patent net weighs 262½ grains.

Method of Cleaning Gold Lace and Embroidery when tarnished.—For this purpose alkaline liquors are by no means to be used; because, whilst they clean the gold, they corrode the silk, and change or discharge its colour. Soap also alters the shade, and even the species of certain colours. But spirit of wine may be employed without any danger of its injuring either the colour or quality of the subject; and in many cases it proves as effectual, for restoring the lustre of the gold, as the corrosive detergents. A rich brocade, flowered with a variety of colours, after being disagreeably tarnished, had the lustre of the gold perfectly restored by washing it with a soft brush dipped in warm spirit of wine; and some of the colours of the silk, which were likewise soiled, became at the same time remarkably bright and lively. Spirit of wine seems to be the only material adapted to this purpose, and probably the boasted secret of certain artists is no other than this spirit disguised. Amongst liquids, Dr Lewis says, he does not know of any other that is of sufficient activity in discharging the foul matter, without being hurtful to the silk. As to powders, however fine, and however cautiously used, they scratch and wear the gold, which here is only superficial, and of extreme tenuity. But though spirit of wine is the most innocent material that can be employed for this purpose, it is not in all cases proper. The golden covering may be in some parts worn off, or the base metal with which it had been iniquitously alloyed may be corroded by the air, so as to leave the particles of the gold disunited, whilst the silver underneath, tarnished to a yellow hue, may continue of a tolerable colour; in which cases it is apparent that the removal of the tarnish would be prejudicial to the colour, and make the lace or embroidery less like gold than it was before. A piece of old tarnished gold lace, cleaned by spirit of wine, was deprived, with its tarnish, of the greater part of its golden hue, and looked almost like silver lace.

Method of separating the Gold and Silver from Lace without burning it.—Cut the lace in pieces, and, having separated the thread from it by which it was sewed to the garment, tie it up in a linen cloth, and boil it in soap ley diluted with water, till it becomes diminished in bulk, which will require but little time, unless the quantity of lace be very considerable. Next take out the cloth, and wash it several times in cold water, squeezing it pretty hard with your foot, or beating it with a mallet, to clear it of the soap ley; then untie the cloth, and you will have the metallic part of the lace pure, and nowhere altered in colour or diminished in weight. This method is much more convenient and less troublesome than the common way of burning; and as a small quantity of the ley will be sufficient, the expense will be trifling, especially as the same ley may be used several times, if cleared of the silky calcination. The ley may be had at the soap-boilers, or it may be made of pearl ash and quicklime boiled together in a sufficient quantity of water. The reason of this sudden change in the lace will be evident to those who are acquainted with chemistry. For silk, on which all our laces are woven, is an animal substance, and all animal substances are soluble in alkalies, especially when rendered more caustic by the addition of quicklime; but the linen in which it is tied, being a vegetable, will remain unaltered.

Blond Lace, a lace made of fine linen thread or silk, much in the same manner as that of gold and silver.

LACEDÆMON, in fabulous history, a son of Jupiter, and Taygeta the daughter of Atlas, who married Sparta the daughter of Europa, by whom he had Amyclas, and Eurydice the wife of Acrisius. He was the first who introduced the worship of the Graces into Laconia, and who built them a temple. From Lacedæmon and his wife, the capital of Laconia was called *Lacedæmon* and *Sparta*.

Lacedæmon, a noble city of Peloponnesus, called also *Sparta*, names which differed in this, that the latter was the proper and ancient name of the city, whereas the former was that of the country, though it afterwards came to be applied to the city. Homer also makes this distinction, when he calls the country *holy*, because encompassed with mountains. It has likewise been known by the name of *Lelegia*, from the Leleges, the first inhabitants of the country, or from Lelex, one of their kings; and *Œbalia*, from *Œbalas*, the sixth king after Eurotas. It was called *Hecatompolis*, from the hundred cities which the whole province once contained. This city was the capital of Laconia, situated on the right or western side of the Eurotas; and it was less in compass than Athens. Polybius makes it forty-eight stadia, a circuit much inferior to that of Athens. Lelex is supposed to have been the first king of Lacedæmon. His descendants, thirteen in number, reigned successively after him, till the reign of the sons of Orestes, when the Heraclidæ recovered the Peloponnesus, about eighty years after the Trojan war. Procles and Eurysthenes, the descendants of the Heraclidæ, usurped the crown; and after them it was decreed that the two families should always sit on the throne together. The monarchical power was abolished, and the race of the Heraclidæ extinguished, at Sparta, about 219 years before Christ. Lacedæmon in its flourishing state remained without walls, the bravery of its citizens forming its only defence. At length, in Cassander's time, and afterwards, when the city was in the hands of tyrants, the latter, distrusting the defence by arms and bravery, built a wall around it, which the tyrant Nabis made very strong. Pausanias ascribes the first walls to the times of Demetrius and Pyrrhus, under Nabis. More than a century and a half before Christ, the walls of the city were pulled down by Philopœmen, who was then at the head of the Achæan League; and Laconia some time afterwards became a Roman province, when reduced by Mummius. (See Sparta.) The present city is called *Misitra*.

LACEDONIA, a city of the kingdom of Naples, in the province of Principato-Ulteriore. It stands on a hill, is the seat of a bishop, and contains 4550 inhabitants.

LACEPEDES, a group of small islands on the north-western coast of New Holland, extending about thirty-six miles from north to south, near the shore, and the largest being about nine miles long. The surrounding seas abound in whales, and fishes of different kinds. Long. 117. 8. E. Lat. 16. 43. N.

LACERNA, a coarse, thick garment worn by the Romans over their gowns, like a cloak, to keep out the rain and the cold. It was first used in the camp, but afterwards admitted into the city. The emperors wore the lacerna of a purple die. The lacerna, at first very short, was lengthened after it became fashionable, which was not till the civil wars and the triumvirate; before this time it was confined to the soldiers. Senators were forbidden to wear it in the city by Valentinian and Theodosius. Martial makes mention of lacernæ worth ten thousand sesterces. Some confound this garment with the penula; but it seems rather to have resembled the *chlamys* and *birrus*.

LA CHARITE', a city of France, in the department of the Nièvre, and arrondissement of Cosne. It is finely situated on the side of a hill, looking down on the Loire. It contains 590 houses, and 5300 inhabitants, who carry on the trades of tanners, hatters, serge and button makers. Long. 2. 56. E. Lat. 47. 10. N.

LACHES (from the French *lascher*, that is, *laxare*, or *lasche ignavus*), in the English law, signifies slackness or negligence, as appears from Littleton, where *laches of entry* is a neglect of the heir to enter.

LACHESIS, in *Mythology*, one of the Parcæ or Fates. Her name is derived from λαχειν, to measure out by lot. She presided over futurity, and was represented as spinning the thread of life, or, according to others, holding the spindle. She generally appeared covered with a garment variegated with stars, and holding spindles in her hand.

LACHISH, in *Ancient Geography*, a city to the southward of the tribe of Judah. Eusebius and St Jerome inform us, that in their time there was a village called Lachish, seven miles southward from Eleutheropolis. Sennacherib besieged Lachish, but did not take it; after which he sent Rabshakeh against Jerusalem. It was at Lachish that King Amaziah was slain by his rebel subjects.

LACHRYMATORY, in *Antiquity*, a vessel in which were collected the tears of a deceased person's friends, and preserved along with the ashes and the urn. Lachrymatories were small glass or earthen bottles, chiefly in the form of phials. At the Roman funerals, the friends of the deceased, or the *præficæ*, women hired for that purpose, used to fill them with their tears, and deposit them carefully with the ashes, in testimony of their sorrow, imagining that the manes of the deceased were thereby comforted and consoled.

LACHSA, Lahsa, or *Hajar*, a division of Arabia, extending along nearly the whole of the south-western coast of the Persian Gulf, from its entrance at Cape Mussendoom, and to a considerable distance inland. Like most other parts of Arabia, the coast is fertile and well peopled; but the interior consists of sandy plains. This country is famed for a breed of asses and camels, and some thousands of the latter are annually exported to Syria. It produces dates, rice, and cotton. The coast from Mussendoom to Bahrein had become such a refuge for pirates, who interrupted by their depredations the trade of the Red Sea, that in 1809 the British government fitted out an expedition at Bombay for the purpose of chastising them. They succeeded in taking by assault Ras-el-Khima, the principal port on this coast, in November 1809, and, burning seventy vessels, carried off considerable plunder. The principal town is Lachsa, situated a few miles up the river Astan, which forms at the mouth a species of bay, opposite to which are the islands of Bahrein, famous for pearls. Long. 48. 34. E. Lat. 26. 56. N.

LACINIUM, in *Ancient Geography*, a noble promontory of the Bruttii, in Italy, the southern boundary of the Sinus Tarentinus and the Adriatic, all to the south of it being deemed the Ionian Sea. It was famous for a rich temple of Juno, surnamed *Lacinia*, with a pillar of solid gold, which Hannibal intended to carry off; but, according to Cicero, was dissuaded by a dream.

LACONIA, or Laconica, a country in the southern part of the Peloponnesus, having Argos and Arcadia on the north, Messenia on the west, the Mediterranean on the south, and the bay of Argos on the east. Its extent from north to south was about fifty miles. It was watered by the river Eurotas. The capital was called Sparta, or Lacedæmon.

LACONIUM, whence our term *laconic*, a short, pithy, sententious speech, such as the Lacedæmonians were remarkable for.

LACQUERS, are varnishes applied upon tin, brass, and other metals, to preserve them from tarnishing, and to improve their colour. The basis of lacquers is a solution of the resinous substance called *seed-lac*, in spirit of wine. The spirit ought to be very strong, in order to dissolve as much as possible of the lac. For this purpose, some authors direct dry potash to be thrown into the spirit. This alkali attracts the water, with which it forms a liquid that subsides distinctly from the spirit at the bottom of the vessel. From this liquid the spirit may be separated by decantation; but by such a process the spirit is impregnated with part of the alkali, which depraves its colour, and communicates a property to the lacquer of imbibing moisture from the air. These inconveniences may, however, be prevented by distilling the spirit; or, if the artist has not an opportunity of performing that process, he may cleanse the spirit in a great measure from the alkali, by adding to it some calcined alum, the acid of which uniting with the alkali remaining in the spirit, forms therewith a vitriolated tartar, which, not being soluble in spirit of wine, falls to the bottom, together with the earth of the decomposed alum. To a pint of the purified spirit, about three ounces of powdered shell-lac are to be added, and the mixture digested during the same day with a moderate heat. The liquor ought then to be poured off, strained, and cleared by settling. This clear liquor is now fit to receive the required colour from certain resinous colouring substances, the principal of which are gamboge and arnotto; the former giving a yellow, and the latter an orange colour. To give a golden colour, two parts of gamboge are added to one of arnotto; but these colouring substances may be separately dissolved in the tincture of lac, and the colour required may be adjusted by mixing the two solutions in different proportions. When silver leaf or tin is to be lacquered, a larger quantity of the colouring materials is requisite than when the lacquer is intended to be laid on brass.

LACTANTIUS, Lucius Coelius Firmianus, an eminent father of the church, at the beginning of the fourth century, was, according to Baronius, an African; but, according to others, was born at Fermo, in the March of Ancona, whence it is imagined he was called *Firmianus.* He studied rhetoric under Arnobius, and was afterwards professor thereof in Africa and Nicomedia, where he was so much admired that the Emperor Constantine chose him as preceptor to his son Crispus Cæsar. Lactantius was so far from seeking the pleasures and riches of a court, that he lived there in poverty, and, according to Eusebius, frequently wanted the necessaries of life. He is justly accounted the most eloquent of all the ecclesiastical authors who have written in the Latin language. He formed himself upon Cicero as a model, and wrote in a style so remarkable for its purity, natural grace, and smoothness, that he is generally distinguished by the denomination of the Christian Cicero. Several works of his are still extant, the principal of which are, 1. his *Institutiones Divinæ*, a treatise in seven books, of which he made an abridgment, adding thereto another tract, *De Ira Divina;* 2. *De Asseribus Dei*, in which he treats of the creation of man, and of divine providence; 3. Two books to Æscepiades, eight books of letters, a poem in hexameter verse, a treatise entitled The Grammarian, and another *De Persecutione.* It is also believed that the treatise *De Mortibus Persecutorum* was written by Lactantius. Some works, however, have been erroneously attributed to this father of the church. Amongst these may be mentioned the Phœnix, which is the production of a Pagan, not of a Christian; the poem upon Easter; that on the Passion of Christ; the Arguments upon the Metamorphoses of Ovid; and the Notes upon the Thebaid of Statius. Of the two last productions, the real author was Lactantius Placidius the grammarian. The prominent characteristic of Lactantius as a Christian writer is, that he exposes the illusions of Paganism with great force of reasoning. But he treats theology more like a philosopher than a divine. He did not thoroughly understand the nature of the Christian mysteries, nor distinguish between the respective provinces of faith and of reason; and hence he was betrayed into some errors, of which advantage has been taken by persons who either knew not, or chose to make no allowance for, the circumstances in which they originated. The best edition of his works is that published at Paris in 1748, in two vols. 4to.

LACTHO, a province of India beyond the Ganges, tributary to the sovereign of Cochin-China. It is bounded on the south by Lars, on the north and east by Tungquin, and on the west by China. This territory has been but imperfectly explored by Europeans; but it is described by the Tungquinese as mountainous, rocky, covered with jungle, and destitute of navigable rivers, with a singularly pestilential air, and water very unwholsome, though the climate is cooler than that of Tungquin. The interior is inhabited by numerous tribes, little better than savage, governed by hereditary chiefs, and perpetually at war with each other. Salt is imported into this country from Tungquin; also salt-fish, oil, and some silk stuffs for the chiefs. The exports to Tungquin are chiefly buffaloes and cotton. Shells and cowries form the medium of exchange. According to information derived from the Tungquinese, this province contains many extraordinary natural caverns, which appear to have served the natives as temples. One cavern is described as a mile across, perforating a mountain, and another as being entered under ground in a boat.

LACTIFEROUS, an appellation given to plants abounding with a milky juice, as the sow-thistle and various others. The name of *lactiferous*, or *lactescent*, is given to all those plants which abound with a thick, coloured juice, whatever may be its colour. Most lactiferous plants are poisonous, except those with compound flowers, which are generally of an innocent quality. Of the poisonous lactescent plants, the most remarkable are sumach, agaric, maple, burning thorny plant, cassada, celandine, puccoon, prickly poppy, and the plants of the natural order *contortæ*, as swallow-wort, apocynum, cynanchum, and cerbera. The bell-shaped flowers are partly noxious, as cardinal flower; partly innocent, as campanula. Amongst the lactescent plants with compound flowers that are innocent in their quality, may be mentioned dandelion, picris, hyoseris, wild lettuce, gum succory, hawkweed, bastard hawkweed, hypochœris, goat's beard, and most species of lettuce.

LACUNAR, in *Architecture*, an arched roof or ceiling, more especially the planking or flooring above porticos or piazzas.

LACYDES was born at Cyrene, a city on the northern coast of Africa. Of his personal history we are able to collect a few facts from Suidas and Diogenes Laertius. He was the son of a certain Alexander, of whom we know nothing except the name, and that his poverty exposed his son to many hardships. The love of learning drew Lacydes to Athens at the time when Arcesilaus had become the founder of what has been called the Middle Academy. He became the pupil of Arcesilaus, and by his acuteness and varied acquirements soon procured for himself the friendship of his instructor. On the death of Arcesilaus he succeeded to the vacant chair, B. C. 241, and presided in the academy for twenty-six years; at the end of which he abdicated, B. C. 215, in favour of two of his disciples, Evander and Telechus. Laertius asserts that he deserted the tenets of Arcesilaus; but Cicero (*Acad.* iv. 6) states that he continued to teach the same doctrines as his predecessor. He taught that there was no certainty in philosophical knowledge; and that in all purely speculative subjects we must refrain from coming to a decision, because the mind of man cannot sufficiently distinguish truth from falsehood. He does not, however, appear to have carried these sceptical opinions into the every-day affairs of life, but to have restricted them to philosophy and science; though his opponents asserted, and with much reason, that such doctrines as he advocated tended to undermine all virtue and morality. Lacydes was the friend of Attalus king of Pergamus, and was invited by him to take up his residence at his court; but he answered, that philosophers admired the portraits of kings most at a distance. The latter part of his life was spent, if we can credit the statements handed down to us, very differently from his early years. He gave himself up to every kind of debauchery, and his passion for wine replaced the taste for study. Athenæus (x. 10) states that he was the greatest wine-bibber of his age, and often came off victorious in contests of that kind. He at last died in consequence of one of his excesses.

LADDER, a frame made with a number of steps, by means of which people ascend, as by a stair, to places otherwise inaccessible.

Scaling Ladders, in the military art, are used in scaling when a place is to be taken by surprise or escalade.

LADEN, in nautical language, the state of a ship when she is charged with a weight or quantity of any sort of merchandise, or other materials, equal to her tonnage or burden. If the cargo with which she is laden be extremely heavy, her burden is determined by the weight of the goods; if it be light, she carries as much as she can stow, that she may be fit for the purposes of navigation. As a ton in measure is generally estimated at 2000 lbs. in weight, a vessel of two hundred tons ought accordingly to carry a weight equal to 400,000 lbs. when the matter of which the cargo is composed is specifically heavier than the water in which she floats; or, in other words, when the cargo is so heavy that she cannot float high enough with so great a quantity of it as her hold will contain.

Laden in Bulk, the state of being freighted with a cargo which is neither in casks, boxes, bales, nor cases, but lies loose in the hold, being defended from the moisture or wet of the hold by a number of mats and a quantity of dunage. Such are usually the cargoes of corn, salt, or such materials.

LADERNOJE-POLE, a circle in the Russian province of Olonez, extending over 660 square miles. It is so woody, marshy, and cold, that a small part only of it is capable of cultivation, and it contains not more than 23,500 inhabitants. The capital is the town of the same name situated on the river Swir. Near to it, Peter the Great formed his establishment for building his fleets. It is now a small place, with few and poor inhabitants. Long. 34. 23. E. Lat. 60. 45. N. It is about 170 miles from St Petersburg.

LADIK, or Ladikieh, a town of Asia Minor, which occupies the site of the ancient Laodicea. The only vestiges that remain of this ancient place are fragments of marble columns, and a few capitals and pedestals of pillars, which the Turks have converted into tomb-stones. The modern town is built of mud, and contains 400 or 500 inhabitants. It is thirty miles west of Konieh.

LADISLAUS, the names of several kings of Poland. See Poland.

LADOGA, a lake in Russia, situated between the gulfs of Onega and Finland, measuring 150 miles by ninety, and considered as the largest in Europe. Peter the Great cut a canal sixty-seven miles in length from the south-western extremity of the lake, thus opening a communication between it and the Gulf of Finland.

LADOS Isles, a group of high, rugged, small islands, running in ridges from the mountains to the sea, with beautiful intervening valleys. They are situated off the north-west coast of the Malay peninsula. Long. 99. 40. E. Lat. 6. 5. N.

LADRONES, or Mariana Islands, a cluster of small islands in the North Pacific Ocean, off the southern extremity of China, and stretching 450 miles from north to south. These islands are fourteen, or, according to others, sixteen in number; namely, Guam or St John, the largest, Zarpane or Rota, Aguignan or St Ann, Tinian, Saypan or St Joseph, Anatachan or St Joachim, Sarigan or St Charles, Guguam or St Philip, Amalagan or Conception Isle, Pagon or St Ignatius, Agrigan or St Xavier, Assonsong or Assumption Island, and Urac, a desert isle. With the adjacent islands, the Ladrones are so near to the continent that they appear like disjointed fragments from the mainland. The islands to the eastward of the great Ladrone are high and uneven, and the depth of water amongst them is about twenty fathoms. Those to the westward are of a more even surface, and appear like a continued land, and the water amongst them is shoaler. These islands have a very barren and unpromising aspect, having scattered patches of verdure in particular spots, but their general appearance being little better than naked rocks, with scarcely a tree or shrub visible. These islands have been celebrated by the author of Anson's Voyage, as little short of a terrestrial paradise. It was in 1742 that Anson's wearied crew landed on them, wasted with sickness and a long sea-voyage, and naturally delighted with the appearance of land in any form; and these islands were, besides, at that time in a state of cultivation. Having since been neglected, they are now overrun with the rank vegetations of a tropical climate; and when the island was visited by subsequent navigators, amongst others by Byron, it was found to be an uninhabitable wilderness, overgrown with impenetrable thickets. The reason of this change was, that, owing to the oppressive policy of the Spaniards, by whom these islands had been conquered, the inhabitants, some time previous to Anson's visit, had been removed to another island, and had left behind them, in the improved state of the country, proofs of their industry and civilization. Cotton and indigo trees abound, and generally all the productions of the tropical climates. Wild hogs are abundant, and of a very large size. The inhabitants are tall in their persons, and very active and robust; they are rude in their habits, and follow blindly the ignorant superstition of their priests, who instruct them in the belief of a malignant spirit, whom they appease by certain ceremonies. Long. of the Great Ladrone, 113. 44. E. Lat. 21. 52. N.

LADY, a title derived from two Saxon words, signifying *loaf-day*, words which have in time been contracted into the present appellation. It properly belongs only to the daughters of earls, and all of higher rank; but custom has made it a word of complaisance for the wives of all gentlemen. As to the original application of this expression, it may be observed, that in former times it was the fashion for opulent families to live constantly at their mansion-houses in the country, where once a week, or oftener, the lady of the manor distributed to her poor neighbours, with her own hands, a certain quantity of bread.

Lady-Day, in *Law*, the 25th of March, being the annunciation of the Holy Virgin.

LAERNE, a town of the Netherlands, in the province of East Flanders, and arrondissement of Oudenarde, containing 530 houses, and 3300 inhabitants.

LÆLIUS Sapiens, C., was the son of C. Lælius Nepos, and distinguished by his love of philosophy in an age when war still continued to be regarded as the only employment worthy of a Roman. He was the pupil of Diogenes the stoic, and afterwards of Panætius. (Cic. *Fin.* ii. 8.) He was the intimate friend and companion of Scipio Africanus the younger, and attended him in his expedition into Africa when he took Carthage, B. C. 146. (Appian. *Pun.* 126.) He was then employed as prætor in Lusitania, where he obtained considerable advantages over Viriathus. (Cic. *Off.* ii. 11.) He was elected consul along with Servilius Cæpio (B. C. 140); but notwithstanding the able manner in which he discharged the duties of the office, he did not succeed in being re-elected, a circumstance which Cicero laments in most feeling language. (*Tusc.* v. 19.) Lælius spent much of his time in the country, devoting himself partly to rural occupations, and partly to study. The mildness of his disposition, and the equanimity of his temper, are noticed by Horace, when he speaks of *mitis sapientia Lælii.* (*Sat.* ii. 1.) He was the intimate friend of Pacuvius and Terence; and it is said that he and Scipio assisted the latter in the composition of some of his plays. It was no doubt his friendship with Scipio that induced Cicero to place the name of Lælius at the head of his beautiful essay on Friendship. The interlocutors are Lælius himself, and his two sons-in law, C. Fannius and Q. Mucius Scævola.

LÆNA, in *Antiquity*, was a gown worn by the Roman augurs, and peculiar to their office. In this gown they covered their heads when they made their observation on the flight of birds, and other omens.

LÆSTRYGONES, the most ancient inhabitants of Sicily. Some suppose them to be the same as the people of Leontium, and to have been neighbours to the Cyclops. They fed on human flesh; and when Ulysses landed on their coasts, they sunk his ships and devoured his companions. According to Homer's description, they were of a gigantic stature. A colony of them is supposed to have passed over into Italy with Lamus at their head, where they built the town of Formiæ; and hence the epithet of *Læstrygonia* is often used for that of *Formiana.*

LÆVIUS, a Latin poet, whose age is unknown, but who probably lived before the age of Cicero. A poem of his, entitled *Erotopagnia*, or Love-Games, is quoted by Aulus Gellius. Apuleius also quotes six lines from the same poet, but he does not state from what work he borrowed them. Lævius had also composed a poem entitled the Centaurs, which Festus quotes under the title of *Petrarum.*

LAGEMAN (*Lagammannus*) *homo habens legem*, or *homo legalis seu legitimus*, or, as we now say, "good men of the jury." The word is frequently used in Domesday, and the laws of Edward the Confessor.

LAGEN (*Lagena*), in ancient time, was a measure of wine, containing six sextarii, and from which is probably derived our *flagon.* Sir Peter Leicester, in his *Antiquities of Cheshire*, interprets *lagena vini* to mean a bottle of wine.

LAGONEGRO, a city, the capital of a district of the same name, in the province of Basilicata, of the kingdom of Naples. It is situated in the valley of Sorgipiano, on the banks of the river of that name, in a fertile and beautiful spot, filled with villas. The population is 5150.

LAGOS, a city of Portugal, the capital of the province of Algarve. It is a seaport, in a bay of the same name, celebrated for the naval victory obtained in it by Admiral Rodney over the Spanish fleet commanded by Don Juan de Langara, in the American war. The vicinity of Lagos is very mountainous, and abounds with woods, which are converted into charcoal, with which fuel it supplies a great portion of the south of Spain and Portugal. It is fortified and well built, has two parish churches, three monasteries, two hospitals, one alms-house, 801 houses, and 4050 inhabitants. A small harbour, guarded by two forts, is good, and can contain a whole fleet. It trades in wine, oil, figs, and corn, and has sumptuous aqueducts.

LAGRANGE, Joseph Louis, a mathematician and astronomer of the first rank, born at Turin on the 25th of January 1736, was the son of Joseph Louis Lagrange, treasurer at war, and Maria Theresa Gros, only daughter of a rich physician at Cambiano.

He was the eldest of eleven children, but nine of them died young. His family was of French extraction on both sides; and his French biographers have dwelt with pleasure on the minute particulars of their emigration, in order the more fully to authenticate their own claim to the honour of calling him their natural as well as adopted countryman. It was his great grandfather that first settled at Turin, in the service of Emmanuel II., who married him to a Roman lady of the family of Conti. They had at one time acquired considerable affluence, but his father had ruined himself by his expenses and speculations; and Lagrange used frequently to observe, that he owed his own success in life to his father's misfortunes, since, if he had been rich, he should never have applied to the mathematics as a profession. The classics were at first his favourite study at the college of Turin; he began his scientific education with reading the works of the ancient geometricians, and at first preferred their methods of investigation to the more modern analysis; but being convinced, as it is said, by a paper of Halley in the *Philosophical Transactions*, of the superiority of the algebraical mode of representation, he applied with redoubled ardour, at the age of seventeen, to the study of the later improvements in the methods of investigation; and in his subsequent works he abandoned, wherever it was practicable, all geometrical considerations, and seems to have valued himself on having produced a complete system of mechanics, free from the incumbrance of any diagram whatever. When he was only nineteen, he was made professor of geometry in the Royal School of Artillery, but not before he had exhibited, in his first publication, a specimen of the improvements which he was throughout his life to contribute to the mathematical sciences.

The friendships which he formed with his pupils, most of whom were his seniors, led to the establishment of a society which afterwards received the sanction of the royal authority, and to the publication of their memoirs, in which Lagrange not only took the most active part as a contributor of original papers, but also by materially assisting in the demonstrations of Foncenex, and promoting the researches of Cigna and Saluces. Foncenex was soon rewarded by being placed at the head of the maritime establishment which the king was then forming; and Lagrange received in a short time a still more flattering remuneration, in the panegyrics which were liberally bestowed on him by his great rivals Euler and D'Alembert; the former procured him, in 1759, the compliment of being made a foreign member of the Academy of Berlin, having become well acquainted with his merits by an epistolary intercourse, which began as early as the year 1754, when Lagrange communicated to him his first ideas of the solution of isoperimetrical problems, which Euler had the delicacy to allow him time to complete, before the publication of his own further researches on the subject.

In 1764 he obtained a prize from the Academy of Sciences at Paris, for a memoir on the difficult subject of the libration of the moon, having treated it by an original method, derived from the principle of virtual velocities, which he afterwards applied so successfully to other branches of mechanics. Soon after this time he found an agreeable relief from the monotony and retirement of his life at Turin, in accompanying his friend the Marquis Caraccioli, who was appointed ambassador at the court of London, as far as Paris, where he had the delight of becoming personally acquainted with a number of the most distinguished mathematicians of the age, who were capable of appreciating his merits, especially with Clairaut, D'Alembert, Condorcet, Fontaine, Nollet, and the Abbé Marie; but indisposition prevented his going on to England, as he had intended, and he returned to Turin after a short stay in France. A second prize, on the subject of the satellites of Jupiter, was awarded him in 1766; and the same tribute was again paid to his merit on three subsequent occasions. It was in this year that he was invited to Berlin, as a successor to

Euler in the place of mathematical director of the academy, Euler having been induced to remove to Petersburg, by a better prospect of providing for his numerous family. The appointment of president of the academy, held by Maupertuis, had been given but in part to Euler; the whole was offered to D'Alembert, who declined it; but both he and Euler united in recommending Lagrange as the fittest person for the situation. It was, however, with some difficulty that he obtained his sovereign's leave to quit Turin; and the favour was at last granted to him partly in pique, on account of the terms of the invitation, which expressed the desire of the "greatest king in Europe" to have the greatest mathematician at his court.

At Berlin he pursued his career of study in tranquillity and without interruption, upon a competent income of about L.300 a year, with the advantage of such demonstrations of the royal protection as were still more important than income to his rank in society. The king seems to have preferred him to Euler, as more tolerant in his opinions, though by no means joining in all the innovations of the day, and rather avoiding every discussion relating to them, as well as any great familiarity with his patron. He was made, in 1772, one of the eight foreign associates of the Parisian Academy. He is said to have married more for the sake of complying with the universal custom of his friends and colleagues at Berlin, than for any desire of female society; and he invited a relation of his own from Turin, who became his first wife; but she was soon after carried off by a lingering disease. He was about this time very closely employed on his greatest and best work, the *Mécanique Analytique*; but it was with some difficulty that the Abbé Marie found a bookseller at Paris, who agreed to undertake its publication, and only upon condition of engaging himself to divide the loss, in case of failure in the sale. He also procured the valuable assistance of Mr Legendre as a corrector of the press.

Upon the death of Frederic in 1786, Lagrange no longer felt the same interest in remaining at Berlin, though he was not treated by the new court with any thing like disrespect. While the ministers of Naples, Sardinia, and Tuscany, were making him offers on behalf of their respective sovereigns, Mirabeau persuaded the French ambassador at Berlin to recommend Mr de Vergennes to invite him to Paris; but it was in reality through Mr de Breteuil's interest, and at the suggestion of the Abbé Marie, that he was ultimately induced to settle there in 1787, having received a grant of an income equal to that which he had enjoyed at Berlin, under the name of a veteran pensioner of the academy, with a vote in its deliberations. He was kindly received by Marie Antoinette, on account of his connection with Germany; and, until the Revolution, he had the use of apartments in the Louvre.

It was at this period of his life, when his success had been the most gratifying, and his fame had become perfectly established, that he appeared to suffer under a degree of melancholy or apathy, which was absolutely morbid. He confessed that all his enthusiasm was extinguished, and that he no longer felt the least relish for mathematical researches. He had not even the curiosity for two years to open the printed volume of his *Mechanics*, which he had never seen except in manuscript. It is a consolation to think, that this annihilation of his energies was only partial and temporary. He amused himself in the mean time with metaphysics, "with the history of religions" and of languages, and with medical and botanical, and especially chemical studies; and the alarms and agitations of the Revolution, which soon followed, instead of overwhelming his broken spirit, seem to have roused his dormant powers, and to have revived his satisfied ambition, exciting him to new labours and new triumphs.

In 1791 his name appeared on the list of the foreign members of the Royal Society of London. Mr Maurice has asserted, that all the scientific bodies of Europe, *except* the Royal Society, received him with open arms; if the remark was intended as a censure of that society, it is right that its injustice should not pass unnoticed.

Notwithstanding the public embarrassments which attended the Revolution, Lagrange's pension was confirmed by the National Assembly, upon the proposition of Mr Duséjour, in the most flattering manner; and when the depreciation of the currency materially reduced its amount, he received a partial indemnification, by being appointed a member of a committee for examining useful inventions, and afterwards a director of the mint, in conjunction with Berthollet and Mongez; but this employment he found too laborious, and resigned it six months afterwards. He was greatly interested at this period in the establishment of the new system of weights and measures; he was so violently bent on *decimation*, that he scarcely forgave Borda for having made a measure of a quarter of a metre; and he thought so little of the advantage of integral subdivisions, that he sometimes declared he should have preferred the number eleven to twelve, for the very reason that it admitted no subdivision at all, and caused all lesser quantities to be expressed in units comparable to each other only. This opinion seems, however, to have been advanced rather as an exaggerated objection to the introduction of twelve, which was suggested by some more ardent innovators, than as seriously attributing a real advantage to the employment of a prime number.

When the academies were suppressed, the Jacobins purified the commission of weights and measures by striking out the names of many of its most distinguished members, while they retained that of Lagrange, probably because he was of no political party whatever, and had always been particularly cautious in expressing his sentiments of the events of the day. In October 1793, however, a decree was passed, which ordered all persons not born in France to leave the country. Guyton, who was a member of the committee of public safety, advised him to claim an exemption from its operation, by a requisition of that committee, on the pretext of his being employed in preparing a report on Dr Hutton's *Treatise on Gunnery*; and he actually received an injunction from the committee, requiring his stay, "in order to complete the calculations which he had undertaken respecting the theory of projectiles." He was attempting to reunite the experiments of Dr Hutton with a more correct theory than had before been applied to them; but he published nothing of importance on the subject. After the murder of Bailly and Lavoisier, he had agreed to return to Berlin, and to resume his former situation there; and he was on the point of obtaining a passport, and even a public mission from Hérault de Sechelles. But the establishment, first of the *Normal School*, in which he was a professor, and then of the *Ecole Polytechnique*, induced him to remain at Paris, and again directed his activity into its ancient channels. In the Normal Schools the masters were mixed with their pupils, in order that the facilities of conversation might produce a development of the subjects discussed in the most elementary manner that was possible; but the conversation was by no means supported in the form of incessant questions and answers; Lagrange's explanations were often interrupted by moments of silence, in which his inventive faculties were deeply engaged in reflection, and the whole of his powers were concentrated on a new train of ideas. It was amidst these discussions that the *Theory of Analytical Functions* originated, a work certainly not destitute of the marks of great mathematical talent, but which, when considered as a substitute for the method of fluxions and its kindred doctrines, resembles very much the suggested introduction of an undecimal in preference to a duodecimal scale of notation, with which the author had before amused himself.

Upon the re-establishment of the Institute, Lagrange was made one of the original members; and he was the first on the list of the Board of Longitude, which was then first instituted at Paris. He received about this time a compliment highly grateful both to his love of fame and to his filial affection, in the person of his father, then past ninety, and continuing to reside at Turin. By the direction of Talleyrand, who was minister for foreign affairs, the commissary of the directory of Piedmont, attended by the generals of the French army, and several other persons of distinction, went in procession to congratulate this venerable person on the merits of his son, whom he had not seen for more than thirty years, whom they declared "to have done honour to mankind by the brilliancy of his genius, and whom Piedmont was proud to have produced, and France to possess as a citizen." The old man lived to the age of ninety-five, and was sincerely regretted by his son.

Under the consular and imperial government, Lagrange was made a senator, a grand officer of the legion of honour, a count of the empire, and a knight grand cross of the order of reunion, in addition to the personal marks of friendship and intimacy which Bonaparte habitually conferred upon him at the meetings of the Institute, and on other occasions.

He applied with so much zeal to the republication of the first part of his *Mechanics* in 1811, and of his *Analytical Functions* in 1813, that his health is supposed to have suffered from the fatigue; which, in conjunction with a predisposition, not uncommon in advanced life, may very possibly have been the immediate cause of a fit that attacked him in the beginning of the latter year. In the month of March he was subject to frequent returns of fainting, accompanied by some fever. On the 8th of April he had a last conversation with Lacépède, Monge, and Chaptal, all the parties being aware that it was to be the last. He felt the approach of death, but he declared that it was in that form neither painful nor even disagreeable. He spoke with proper gratitude of the favours he had received from Bonaparte, who afterwards provided very liberally for his widow and his brother. The interview lasted more than two hours; and though his memory often failed him with respect to names and dates, yet his language was correct and energetic. He survived this effort only two days, and died on the morning of the 10th April 1813. He was buried at the Pantheon, or the church of St Géneviève, and his friends Lacépède and Laplace paid the last honours to his memory in a funeral oration.

Lagrange was habitually of delicate health, and extremely temperate in his diet and mode of life, limiting his food almost entirely to vegetables, and taking his exercise very punctually in the open air. At the age of fifty-six he married the young and handsome Miss Lemonnier, who appears to have felt the splendour of his celebrity and the goodness of his heart, as affording much more than a compensation for the great inequality of their ages. He was deeply sensible of her affectionate attachment, which he considered as the greatest happiness of his life, and on account of which alone he regretted its termination. He had no children, and he was perfectly contented to be without them. In the midst of the most brilliant societies he was generally absorbed in his own reflections; and especially when there was music, in which he delighted, not so much for any exquisite pleasure that he received from it, as because, after the first three or four bars, it regularly lulled him into a train of abstract thought, and he heard no more of the performance, except as a sort of accompaniment assisting the march of his most difficult investigations, which he thus pursued with comfort and convenience. He was less fond of the theatre, from which he often returned without knowing what piece had been represented. His manner in conversation was gentle and timid; he was more in the habit of interrogating than of giving his opinion, and his favourite expression was, "I don't know" .... He was not, however, easily induced to change his sentiments when they were once fixed, having generally adopted them upon mature consideration. As a writer, whenever any controversy occurred, he was always calm in defending himself, and respectful in speaking of his antagonists. Notwithstanding that his person was striking and characteristic as well as pleasing, he would never consent to have his portrait painted, thinking it unworthy of a man of intellectual excellence to wish to be remembered for the external form of his features. But a sketch of him was once obtained by stealth at a sitting of the Institute, and a mask of his face was taken after his death. His works bear witness, that for fifty-four years he occupied either the first or very nearly the first place among all the mathematicians of his age, and of all ages. "Of all the inventors," says Laplace, "who have the most contributed to the advancement of human knowledge, Newton and Lagrange appear to me to have possessed in the highest degree that happy tact, which enabled them to distinguish general principles among a multitude of objects enveloping them, and which is the true characteristic of scientific genius. This tact, in Lagrange, was united with a singular elegance in the method of explaining the foundations of the most abstract truths of analysis." Lagrange was a great admirer of Euler, who perhaps excelled him in the adroitness with which he employed the most refined artifices of calculation, though his views and methods were less original and less powerful. D'Alembert was highly esteemed by Lagrange, as a man of abundant ingenuity and talent, though less accurate in his conclusions, and in his modes of reasoning, than either Euler or Newton. Newton he envied almost as much as he admired, for having found a system of the world in existence, and the principles of its modification not yet understood; but when it is remembered that the places of the heavenly bodies are now ascertained to seconds more nearly than they were to minutes during the life of Newton, it cannot be thought that Newton left too little for his successors to accomplish.

1. His first publication, at the age of eighteen, was a Letter to C. J. Fagnano, 23d June 1754. It contains series for fluxions and fluents of different orders, somewhat resembling the binomial theorem of Newton.

2. The series of his papers in the *Miscellanies of Turin* is continued from 1759 to 1785. The first is on Maxima and Minima, *Misc. Taur.* i. 1759, p. 18. It is founded on the principles laid down by Maclaurin, and is illustrated by the case of the successive transmission of an impulse through a series of elastic bodies, comprehending the combination of a number of variable quantities. 3. On an Equation of Finite Differences, and on the Theory of recurring Series, p. 33. The equation is resolved by an exponential integral, and the sum of the series is obtained by the principles of fluxions; the same mode of calculation is also applied to the laws of chance. 4. Researches on the Nature and Propagation of Sound: end of the volume. The investigations of Taylor and of Newton were true and correct as particular solutions only of the problems of chords and of undulations, though mistaken for general solutions, and as such successfully combated by Cramer, whose reasoning, though certainly too far extended, is here approved by Lagrange. Daniel Bernoulli very successfully defended them both, not only as particular solutions, but as capable of being rendered universal by proper modifications and combinations. Eu-

ler had proposed a more general construction for the case of chords; D'Alembert insisted that this method required a limitation to figures exempt from angles and from abrupt changes of curvature, and Lagrange is inclined to admit his exceptions. But, after all, the question is merely a metaphysical refinement, since no abrupt changes can ever occur in the actual form of a chord; and a chord affording a harmonic of unlimited acuteness will approach without limit to a mathematical angle. The author begins, in this essay, with considering the motions of a finite number of bodies, and then proceeds to the affections of a fluid, which he reduces to the same equations as are applicable to the motions of chords, and these he integrates in D'Alembert's manner. He lastly examines the phenomena of the grave harmonics observed by Tartini, and explains them very satisfactorily from the analogy of the beats of discordant sounds. 5. New Researches on Sound, *Misc. Taur.* ii. 1760–1, p. 11. The same subject is here continued, and extended to the divergence of sound, which had before been examined by Euler. The author now admits that there is no inconsistency in the demonstration of Newton and Cramer, which deduce the same velocity from different laws of the supposed motion, since the velocity is really uniform in all cases. The oscillations of a heavy chain are computed, and some remarks are made in conclusion respecting the sounds of flutes. 6. On the Maxima and Minima of Indefinite Integrals, p. 173. This essay contains the foundation of the method of independent variations, which has excited so much attention, for the universality of its application and the utility of its results. It was received with distinguished applause by Euler, as fulfilling his own wishes for the extension of a similar method; and it was Euler who more fully explained its principles, and gave it the name of the method of variations, which has since been generally applied to it. In fact, however, the foundation of the method had long before been laid by Leibnitz, under the name of differentiation from curve to curve; and he had proved that the process of integration, with respect to one kind of variation, might be applied to the differentials or fluxions taken in another manner, without the necessity of first obtaining the fluent; and Euler had employed this consideration in treating of the geometrical properties of curves affording maxima or minima; but his method is less simple and less general than that of Lagrange, who first pointed out the universality of the principle, that the variation of the fluxion is equal to the fluxion of the variation, and showed its utility in many cases of such integrations, as leave the expression concerned still a fluxion of another kind; and in the mechanical application of the method, he made the fluxion of the ordinate of a vibrating chord represent its inclination to the axis at any given time, whilst its variation indicated its velocity or its change of place in successive intervals of time, and the fluxion of a revolving solid to relate to the magnitude of its different parts, whilst its variation depended on its rotatory velocity. The steps of the method are generally simple and easily understood, at least they may and ought to be rendered so; but the merit of the invention is not the less because it admits of a very ready application, and because it might have occurred to a less distinguished mathematician; as indeed something nearly resembling it seems to have been employed by Fontaine in 1734, under the name of the fluxiodifferential calculus, in the investigation of a tautochronous curve. 7. It was particularly in demonstrating the law which is called the law of the least action, that Lagrange completed the theory of variations, where Euler had felt its deficiency; and the Application of the Method to several Mechanical Problems constitutes the second part of the Memoir, p. 106. The author takes occasion also to correct an error of D'Alembert, who had imagined that there was no necessity that the different strata of a given density, in a body like the earth, supposed to be in a state of fluidity, should all be level, which, however, is here shown to be a necessary consequence of D'Alembert's own equations. 8. Addition to the Memoir on Sound, p. 323; admitting the difficulty raised by D'Alembert respecting the continuity of the figure of a chord, and acknowledging that the initial figure must not be supposed angular; while, in fact, as Mr Fourier has lately demonstrated, and as had been remarked many years ago in this country, an infinite series of harmonic curves may approach infinitely near to two right lines meeting in an angle. 9. Problems relating to the Integral Calculus, *Misc. Taur.* iii. 1762–5, p. 179: a miscellaneous paper, containing remarks on the resolution of equations, containing fluxions of different orders; on some cases of the motions of fluids; on the vibrations of chords; on the properties of small oscillations in general; on loaded threads; on central forces; and on the theory of Jupiter and Saturn. 10. An Arithmetical Problem, *Misc. Taur.* iv. 1766–9, p. 44. This paper, dated at Berlin, contains a complete resolution of all equations of the second degree, having whole numbers for their roots; a problem, like most of those of Fermat, of more curiosity than utility, but well calculated to exercise the powers of minds like those of Euler, Lagrange, Legendre, and Gauss. The question which is the particular subject of this paper was proposed as a challenge by Fermat to his contemporaries in England, and correctly answered by Wallis, though without a very satisfactory demonstration. 11. Integration of an Equation, p. 98: a case in which the whole equation is integrable, though its parts, even when properly separated, are incapable of perfect integration. 12. On the method of variations, p. 163: in answer to Fontaine, and to Le Seur and Jacquier, who had attacked him in their integral Calculus. 13. On the Motion of a Body attracted by two fixed Centres, p. 188–216, including the effects of different supposed laws of attraction. 14. On the Figure of Columns, p. 123. This memoir contains an attempt to demonstrate that the cone is a more advantageous figure for the strength of a column than any conoid, and the cylinder than any cone. But the calculations are founded on the erroneous supposition that the column must bend before it breaks; and, even upon this hypothesis, it appears possible to assign a stronger form than a cylinder, since the summit and the base of the cylinder must certainly contain some useless matter. 15. On the Mean of a number of Observations, p. 167; showing the advantage of taking the mean from the theory of probabilities. 16. On the Impulse of Fluids, *Mém. Taur.* 1784–5, i. p. 75. The author observes, that this impulse will be measured by a column of twice the height due to the velocity when the whole impulse of the jet is received by an obstacle, but of the simple height when a limited surface is exposed to the force of a larger stream. 17. On the Integration of some irrational Fluxions, ii. p. 218; involving the square root of an expression ascending to the fourth power of the variable quantity.

18. Some of the later of these papers are subsequent in date to those which are found in the *Memoirs of the Academy of Berlin*; but the order of enumeration is of little consequence. The first communication of Lagrange to the academy, of which he was made director, is on Tautochronous Curves, *Mém. Berl.* 1765, p. 364. The paper is dated 1767; and it contains a completion of Fontaine's investigation of the subject. 19. On the expected Transit of Venus, 1766, p. 265. The author has here analytically investigated the curves of immersion and emersion for the different parts of the earth. But, as Mr Delambre observes, in order to arrive at the very easy and tolerably accurate solution previously given by Delille and Lalande,

he is obliged to employ in succession several elaborate expedients, founded on some very subtile principles, accompanied by various transformations of his ordinates, while, by a trigonometrical calculation of a few lines, we may obtain a more complete formula, comprehending even the terms which he has neglected, and which, although very small, are not absolutely insensible. At the same time, he has certainly applied his formula to the calculation of the parallax of the sun in a very convenient manner, which had accidentally escaped both Delille and Lalande, though it follows readily from the trigonometrical calculation. 20. On Indeterminate Problems of the Second Degree, 1767, p. 165. This is the first of a numerous series of papers relating to this difficult branch of analysis, which, notwithstanding its perfect inutility, has afforded sufficient scope for the exertion of talent, to give celebrity to the names of Diophantus and Fermat among the most ingenious of mathematicians. 21. On Numerical Equations, p. 311. This subject was also much cultivated by the author at a subsequent period: he here finds an equation for the differences of the roots, and exhibits the result in the form of a continued fraction. 22. Continuation of the Memoir on Numerical Equations, 1768, p. 111. The method of continued fractions is still further improved. 23. On the Resolution of Indeterminate Problems in whole Numbers, p. 181. 24. On the Resolution of Literal Equations by Series, p. 251. The contents of these memoirs have been principally merged in the author's later productions. 25. On the Force of Springs, 1769, p. 167. It is demonstrated in this interesting paper, that the force of a hair-spring approaches to the law of a circular pendulum, the more nearly as its length is greater. 26. On Kepler's Problem, p. 204: an application of the methods explained in the last volume, especially of a very elegant formula for the reversion of series. 27. On Elimination, p. 303: a refined and general method of exterminating a quantity from an equation, which, however, is somewhat intricate, even in the simplest cases. 28. Remarks on Isochronous Curves, 1770, p. 97: chiefly in answer to Fontaine, who had attacked him, and who had claimed the invention of the test of integrability of an expression containing several variable quantities. Lagrange observes, that he might very possibly have rediscovered it, but that it was published by Nicolas Bernoulli in 1720; by Fontaine not till 1738. 29. On Arithmetical Theorems, p. 123; relating to the decomposition of a number into squares. 30. On the Resolution of Equations, p. 134. 31. On a Theorem respecting Prime Numbers, 1771, p. 125. A demonstration of the property of prime numbers discovered by Mr Wilson, and published by Waring; and of some other theorems of Waring. 32. On Equations, p. 138: in continuation. 33. On a New Mode of Differentiation and Integration, 1772, p. 185. The novelty consists in considering the characteristic of a fluxion as a quantity multiplying the letter to which it is prefixed, and inferring by induction that the result of the combinations obtained will in general remain unaltered by the supposition. The grounds of this method have been of late more fully explained by Arbogast and others. The results are here applied to interpolations, and to differences of various orders. 34. On the Form of Imaginary Roots, p. 222: in general reducible to $A + \sqrt{-1}\,B$. 35. On Astronomical Refractions, p. 259: without any practical applications. 36. On Equations of Partial Differences, p. 353; especially on finding multipliers to make them integrable. 37. On undisturbed Rotation, 1773, p. 85: a more direct method of investigation than that of Euler or D'Alembert, but without any new results. 38. On the Attraction of Elliptic Spheroids, p. 121. The author observes, that Maclaurin's prize essay is a masterpiece of geometry, comparable to the best works of Archimedes, though D'Alembert had once doubted of the accuracy of some of his propositions. Thomas Simpson's was the first analytical solution of the problem, but it was indirect, and depending on series only. In this paper the method of demonstration only is varied. Legendre and Laplace subsequently continued the inquiry. "But Mr Ivory," says Delambre, "has lately shown us that a very simple consideration may in some cases supersede a multitude of calculations, and even afford us theorems to which the most prolix computations could scarcely have conducted us." 39. On Triangular Pyramids, p. 149: an analytical determination of the content, and of the figures that may be inscribed in the pyramids, when their six sides are given. 40. Arithmetical Researches, p. 265: on the integral roots of equations of the second degree. 41. On Particular Integrals, 1774, p. 197. Laplace had already pointed out the occasional occurrence of integrals not included in the general and direct expression obtained by the usual modes of integration. Such values are here deduced from the variation of the quantities originally considered as constant, which often affords us an equation of a different form, and leads to values not comprehended in the regular expression of the integral. 42. On the Motions of the Nodes of the Planetary Orbits, p. 276. Euler, Lalande, and Bailly had found some expressions for the temporary change of position of the nodes: the equations are here integrated, and the total changes determined. 43. On Recurring Series varying in two ways, or on Partial Finite Differences, 1775, p. 183: with an application to the theory of chances, upon Laplace's principles. 44. On Spheroids, p. 273: a demonstration of Maclaurin's theorem (Fluxions, art. 653) concerning the attraction of a compressed spheroid or an amygdaloid; derived from the formulæ contained in the former papers. 45. Arithmetical Researches continued, p. 323: demonstrating some theorems of Fermat with which Euler had not succeeded; yet leaving others still unattempted. 46. On the Mean Motions of the Planets, 1776, p. 199: showing that all their changes are periodical. Laplace had detected an error in the author's reasoning when he attributed secular equations to the motions of Jupiter and Saturn, the expressions containing the terms in question being compensated by others which he had neglected. 47. Cases of Spherical Trigonometry solved by Series, p. 214: without any apparent advantage. 48. On Integration by continued Fractions, p. 236: gives an example of the binomial theorem converted into a continued fraction, which, however, exhibits no particular elegance nor simplicity. 49. On the Number of Imaginary Roots of Equations, 1777, p. 111. Harriot was the father of the doctrine of equations. Newton made great improvements in it, but his rule remains imperfect with regard to the higher equations, even with the additions of Maclaurin and Campbell. In the present paper the theorem of Waring is demonstrated, without any material attempt to extend it. 50. On the Diophantine Analysis, p. 140. It is remarked that Fermat left all his propositions undemonstrated, except this theorem, that the sum of two biquadrate numbers can never be a square. 51. On Escapements, p. 173: an investigation of the best forms of pallets for the dead beat and the recoiling scapements. 52. On determining the Orbits of Comets by three observations, 1778, p. 111–124. The first part of this memoir is historical and critical, and the author allows due credit to the ingenuity of Newton's method: his own does not appear to have been of any practical utility. 53. On the Theory of Telescopes, p. 163: comparing the general theorems of Cotes and Euler, and applying the method of recurring series to their demonstration; with a rule for determining the magnitude of the field. 54. On the Expression of the Time in a Conic Section, p. 181: after Lambert, who determines it from the chord of the arc described, the sum of the revolving radii, and the great axis: the theorem is here analytically demonstrated. 55. On Particular Integrals, 1779, p. 121: examples from some mechanical curves. 56. On Geographical Projections for Maps, p. 161–186. The methods here proposed for the construction of maps have been found too intricate for adoption. 57. On the Theory of the Libration of the Moon, 1780, p. 203. In the prize essay on the moon's libration, the author had made the first application of the method of variations: the investigation is here continued, and it is observed that the moon cannot be of homogeneous matter, nor its form such as would afford equilibrium to a fluid covering it, since the effects of the ellipticity, so determined, would be much less perceptible than they are. 58. Report on a Quadrature of the Circle, *Hist. Ac. Berl.* 1781, p. 17. This paper only requires to be noticed as a specimen of the author's condescension. 59. Theory of the Motion of Fluids, *Mém.* p. 151: an application of D'Alembert's principles to the phenomena of running fluids, and to the motion of waves; but founded on an arbitrary assumption with respect to the depth affected by the waves. 60. On the Secular Variations of the Elements of the Planets, p. 199. The theory of perturbations is here examined by two methods, either comprehending the general form of the orbit, or regarding the local effects only. 61. Report on a Mode of finding the Form of the Earth, *Hist.* 1732, p. 35: a proposal of no value whatever. 62. On the Secular Variations of the Planets, *Mém.* p. 169: a continuation of the former memoir, with all the details of the application, and a determination of the change of the place of the ecliptic, together with a demonstration of the permanency of the general arrangement of the system, depending on the exemption of the mean distances from all variations not periodical, while the other elements are liable to greater alterations. 63. On the Periodical Variations of the Planetary Motions, 1783, p. 161: a sequel to the memoirs on the secular variations. 64. Additions respecting the Secular Variations, p. 191: completing the examination, and extending it to the case of Jupiter and Saturn, which had before been investigated by Laplace. 65. On the Correction of the Errors of Astronomical Approximations, p. 224. The errors here considered arise from the employment of the powers of the arcs described in the equations concerned, these arcs increasing without limit: they may be avoided by means of approximations founded on the supposition of the variation of the elements. Laplace had before employed a method still more refined. 66. On a particular mode of Approximation, p. 279: resembling that which Briggs employed for making logarithms. 67. On a new property of the Centre of Gravity, p. 290: relating to the mutual distances of the bodies. 68. A direct and general determination of the Motion of a Comet, p. 296. In this third memoir the problem is reduced to equations of the eighth or seventh degree. 69. Theory of the Periodical Variations of the Planetary Motions, 1784, p. 187: continuation of the memoir of the preceding year, containing the independent variations of the eccentricities and inclinations for the six principal planets; with a numerical application of the formulæ demonstrated in the first part. 70. On the Integration of Equations of Linear Partial Differences, 1785, p. 174: entering into further details of the method laid down in a former paper, which is here applied to the problem of trajectories, a problem once proposed by Leibnitz as a trial of strength to Newton, who was not fully aware of the nature of the difficulty intended to be combated: it was, however, solved in England by Taylor, though indirectly. Nicolas Bernoulli and Hermann gave a more complete solution, and Euler added still more to the generality of the investigation. The author observes that the problem is a mere curiosity; there is, however, one case in which a trajectory of the kind here considered is actually applicable to a natural phenomenon of common occurrence, which is that of a wave diverging from a point in a gradually shelving shore; for the figure or direction of the collateral parts of such a wave may be shown to be the orthogonal trajectory cutting an infinite number of cycloids beginning at the given point. 71. On the Motion of the Aphelia of the Planets, 1786, i.; a geometrical investigation, in the manner of Newton, intended as an appendix to the *Principia*. 72. On the Theory of Sound and Waves. This paper is also intended to complete the demonstrations contained in the same work. The volume, in which both these interesting memoirs appear, seems to have been published out of the regular order, from some circumstances connected with the death of Frederick; and it is wanting in many of the British libraries. 73. Note accompanying a Memoir of Duval le Roi, 1786–7, p. 253. On the Secular Equations of the Georgian Planet. 74. On a Question relating to Annuities, 1792–3, p. 235: the case of an annuity supposed to commence after a death, and to cease at a given age. 75. Additions to former Memoirs, p. 247: on recurring series (n. 43); on elliptic spheroids (n. 38); on interpolations, in Mouton's manner, comprehending the inequality of the distances of the observations; on the secular equation of the moon (n. 64.) After Laplace's great discovery of the cause of the secular acceleration, Lagrange found that it might have been easily deduced from his own calculations, almost in the same form, if he had not accidentally neglected the application, from having assured himself, in 1783, that the results of a similar computation were nearly insensible in the case of Jupiter and Saturn. It was in 1787 that the discovery of Laplace was announced. The acceleration here computed is 10″·5 for the first century after 1800. Mayer found it 9″, from a comparison of observations. 76. On a general Law of Optics, 1803, *Math.* p. 3: a demonstration of the foundation of the method long used by English opticians for determining the magnifying powers of telescopes of all kinds, which form an image of the object-glass beyond the eye-glass, by measuring the diameter of that image. The author hazards, in this paper, the very singular assertion, that the illumination of the object must be the same in all telescopes whatever, notwithstanding the common opinion, that it depends on the magnitude of the object-glass; and his reasoning would be correct if the pupil of the eye were always less than the image of the object-glass in question; since, as he observes, the density of the light in this image is always inversely as the magnifying power; but he forgets to consider that the illumination on the retina, when the whole pencil is taken in, is in the joint ratio of the density and the extent; a consideration which justifies the common opinion on this subject, and shows that a most profound mathematician may be grievously mistaken in his conclusions, if he proceeds to calculate upon erroneous grounds. It deserves, however, to be remembered, that the brightness of any given angular portion of a magnified image must always be somewhat less than that of an equal portion of the object seen by the naked eye; because it can be no greater if the pencil fills the pupil, and will be less in proportion as the pencil is smaller than the pupil, besides the unavoidable loss of light at the refracting surfaces.

77. The later works of Lagrange have principally been published at Paris, and most of them in the various collections of the academy. The earliest of these are the prize memoirs; and, first, the essay on the Libration of the Moon, which obtained the prize in 1764, *Ac. Par.* Prix. ix. 1772. It is in this memoir that the method of variations was first practically applied to a mechanical problem.

78. On the Inequalities of the Satellites of Jupiter, in 1776; including the consideration of their mutual perturbations, and consequently a case of the problem of six bodies. The author never resumed the subject, but its investigation was completed by Laplace. 79. A New Method of solving the Problem of Three Bodies, in 1772. 80. On the Secular Equation of the Moon, in 1774, *M. Sav. Etr.* vii. for 1773: an unsuccessful attempt, with conjectures respecting the existence of a resisting medium, and even doubts of the accuracy of the foundation of Halley's discovery. 81. A prize memoir, On the Perturbation of Comets passing near Planets, *M. Sav. Etr.* x. Par. 1785, p. 65: finding the path directly, without regard to the conic sections, and employing three different modes of computation for the different parts of the orbit. 82. On forming Tables by observations only, *Mém. Ac. Par.* 1772, i. p. 513. The method of recurring series is principally employed, and the author observes, that the problem is more useful than difficult, giving an experimental example in the equation of time, for which he obtains, from the results of the tables, an expression very near the truth. Delambre remarks that this is only a continuance of the system adopted by Ptolemy and the other ancient astronomers, showing what we might have done in a circuitous manner by pure mathematics, if Newton and the laws of gravity had not existed; and he thinks the paper only valuable as a specimen of Lagrange's talent for overcoming difficulties which he might more easily have avoided. 83. On the Nodes and Inclinations of the Planetary Orbits, 1774, p. 97: with details of the calculations for all the planets. 84. On the Variation of the Elements of the Planets, *Mém. Math. Inst.* 1808, p. 1. The object of this paper is to show, as Poisson had done before, that all the changes of the system are periodical. The method is more general, but less simple, than that of Laplace, who first discovered the principle by induction. The lunar acceleration is given as an example. Mr Poisson has extended his calculations to quantities of the second order, which do not enter into Lagrange's investigations. 85. On the Variation of Independent Quantities in general in Mechanical Problems, p. 257. The author observes, that many of the modern improvements of mathematics depend on the doing away the distinction between constant and variable quantities, which was so valuable when it was first enforced by Descartes. 86. A second Memoir on the Variation of Independent Quantities, 1809, p. 343: simplifying the general application of the doctrine.

87. Lectures on Arithmetic and Algebra, *Séances des Ecoles Normales*, year III. 1794–95. The first lecture relates to the elements of arithmetic, the second to the lower orders of equations, and the third to the higher. All these lectures, under the name of conversations, were taken down in short-hand by some of the students, and afterwards corrected by the professors.

88. An Essay on Political Arithmetic, Roederer, *Collection de divers Ouvrages*, Paris, an. IV. 1795–96.

89. In the *Journal de l'Ecole Polytechnique*, we find an Essay on Numerical Analysis, and on the Transformation of Fractions, vol. ii. 1798, p. 95. It contains the elementary theory of continued fractions, and the mode of reducing them. 90. On the Principle of Virtual Velocities, p. 115: chiefly relating to pulleys. 91. On the Object of the Theory of Analytical Functions, vi. 1800, p. 232: a detailed explanation of the grounds of the theory laid down in the separate publication on this subject. 92. Analysis of Spherical Triangles, p. 270: giving all their essential properties in a concise form. 93. Lectures on the Calculus of Functions, xii. 1804: published also separately in 8vo: a commentary on the theory of functions, and a supplement to it, contained in twenty lectures. 94. Two more Lectures, xiv. 1808: at the end, chiefly relating to the method of variations. 95. On a Difficulty respecting the Attraction of Spheroids, viii. xv.: remarks which may serve as a commentary on a passage of the *Mécanique Céleste.*

96. On the Origin of Comets, *Connoissance des Tems*, 1814. 97. On the Calculation of Eclipses, as affected by Parallax, 1817: from the *Berlin Almanac* for 1782. This memoir, as Delambre observes, is singularly attractive to a person previously unacquainted with the methods which are employed; but though the formulæ first introduced are direct and rigorously accurate, the whole investigation ends in an approximation which wants both these properties.

98. The most important of all the works of Lagrange are those which have appeared in separate volumes; and among these we may reckon his Additions à l'Algèbre d'Euler, 8vo, Lyons, 1774, vol. ii.; German, 1796; English, 1797. They relate chiefly to continued fractions and to indeterminate problems, and constitute the most valuable part of the whole work, which, in its abridged form at least, is far inferior to Maclaurin's Algebra. 99. Mécanique Analytique, 4to, Par. 1788, 2d edit. vol. i. 1811; vol. ii. by Prony, Lacroix, and Binet, 1815. This work exhibits a uniform and elegant system of mechanical problems, deduced from the simple principle of virtual velocities, which was well known to former authors, but never so extensively applied. It has been remarked, that many parts of it may be read with advantage, even by those who are not competent to enter into any of the computations, exhibiting such a history of the progress of the science, as could only have been sketched by a master. The new edition, begun at the age of seventy-five, comprehends all the improvements contained in the author's later memoirs on various subjects. 100. Théorie des Fonctions Analytiques, 4to, Par. 1797, 1813. The abstract theory of analytical functions has been very fashionable among modern mathematicians; but the improvements which it contains are chiefly of a metaphysical nature, if they can with propriety be called improvements. The notation is less simple than that which is in common use, and has been abandoned by the author in some republications of the works in which he had at first employed it. The calculations, too, are often more intricate than others which afford the same conclusions. 101. Résolution des Equations Numeriques, 4to, Par. 1798, 1808. The refined and abstruse speculations contained in this volume are more calculated to promote the advancement of the abstract science of quantity, than to be applied, as the title would seem to denote, to the purposes of numerical computation. The methods investigated are in general laborious and complicated, though instructive, and capable of extensive application; and for equations of which all the roots are real, the author himself recommends Mr Budan's method, as preferable to his own. The second edition contains a number of very interesting notes, which are full of ingenuity and novelty.

The author of so immense a series of laborious investigations must certainly have been a most extraordinary man. He had acquired the character of an illustrious mathematician almost in his boyish years; and he continued to apply the force of his powerful mind, for more than half a century, to the almost uninterrupted pursuit of his favourite sciences. It seems, however, that his earliest were also his greatest successes; and all that followed was as little as could well be expected from a continued employment of the means which he possessed at the beginning; for, in fact, the whole taken together appears to bear a stronger character of great industry, than of great sagacity or talent.

"It was formerly usual," says Delambre, "for mathematicians to inquire, in every investigation, for some general considerations, which might be capable of simplifying it, or of reducing it to a problem already resolved, and to endeavour by these means either to abridge the calculation, or sometimes to supersede it altogether. But since the discovery of the infinitesimal calculus, the facility and universality of this method, which often renders the possession of *any talent in the calculator wholly unnecessary*, has made it more usual for mathematicians to direct their chief attention to the perfection of this all-powerful instrument. But, at the present day, when researches of this kind appear to be completely exhausted by the labours of Euler, Lagrange, and their industrious contemporaries, it might perhaps be more advisable to return to the ancient method, and to follow the example of" Newton, surely, and of " Daniel Bernoulli, who, as Condorcet observes, was entitled to the praise of moderation in the introduction of his calculations. Lagrange was in the habit of employing his sublime talents in a different manner. He liked to make every thing dependent on his analysis, though, in some instances, he united both methods in the highest degree, as his invention of the calculus of variations bears witness. His reducing the theory of sound to that of the vibration of chords, is a specimen of a very ingenious simplification; as well as his mode of computing the planetary motions by the variation of the elements of their orbits, which is also applicable to all other cases of the operation of small disturbing forces. But it must be confessed, on the other hand, that he has sometimes created difficulties where none existed, by applying his profound and ingenious methods to the solution of elementary problems, which may be obtained from a construction of the simplest kind; and the powerful agents which he employs, on many trifling occasions, remind us only of the man in the fable, who came to borrow the club of Hercules, and the thunder of Jupiter, for the purpose of destroying a flea;" or of the modern mathematician, who, without any fable, or any figure of rhetoric, proposed to adjust a standard measure by placing it at a distance and viewing it with a good telescope. The habit of relying too confidently on calculation, and too little on common sense, will perhaps account for the mistakes of Lagrange which have been already noticed, respecting the forms of columns, and the illumination of optical instruments; nor are they the only instances of the kind which may be produced from the modern history of the sciences. It seems, indeed, as if mathematical learning were the *euthanasia* of physical talent; and, unless Great Britain can succeed in stemming the torrent, and in checking the useless accumulation of weighty materials, the fabric of science will sink in a few ages under its own insupportable bulk. A splendid example has already been displayed by the author of the article ATTRACTION; and, to do justice to our neighbours, it must be allowed that they have received the boon with due gratitude, and acknowledged it by merited applause: " All the analytical difficulties of the problem," says Legendre and Delambre (*Mém. Inst.* 1812) " vanish at once before this method; and a theory, which before required the most abstruse analysis, may now be explained, in its whole extent, by considerations perfectly elementary." It is indeed only when a subject is so simplified that the investigation can be considered as complete, since we are never so sure that we understand the process of nature as when we can trace at once in our minds all the steps by which that process is conducted. It is not without some reason that a similar disposition to revel in the luxury of mathematical sports has been sometimes objected to Laplace, a man of equal analytical acquirements with Lagrange, but possessed apparently of greater sagacity, and certainly more successful in his application of mathematics to physical researches, although he also seems, on some occasions, to have suffered his habits of abstract reasoning to lead away his attention from the true conditions of the problem, particularly in his first supplement respecting capillary attraction, which concludes with an equation so erroneous, that he has been obliged to abandon it in silence. (See the article COHESION.) Another instance of ill-applied computation has been noticed in the article CHROMATICS; when Laplace attempted to deduce the laws of extraordinary refraction from the principle of the minimum of action, he seems to have forgotten that the demonstration of that principle, in his own great work, rests *expressly* on a condition which is here wanting, that " the forces concerned must be functions of the distances," and of course independent of the directions. These imperfections, however, do not deserve to be noticed as materially affecting the general merits either of Lagrange or of Laplace, but they may be considered as accidents which ought to warn us against relying too implicitly on authority, however high, when it appears to militate against clear, simple reasoning, and sound common sense.

(Delambre, *Mém. Inst.* 1812, ii.; *Journal de l'Empire*, 28th April 1813; Virez et Potel, *Précis Historique*, Paris, 1813, in 4to; Cossali *Elogio*, Padua, in 8vo, 1813; Maurice in *Biographie Universelle*, xxiii. Paris, in 8vo, 1819.)

LAHDACK, a mountainous district and independent Tartar kingdom in Northern Hindustan, situated to the north of the great Himalaya ridge of mountains, principally between the thirty-fourth and thirty-seventh degrees of north latitude. It is bounded on the north and east by Thibet, on the west by Cashmere, and on the south by the Nahry Sangkar province. These limits are not, however, precisely defined. This country imports from Thibet fine goats' hair or shawl wool, which is re-exported to Cashmere, and there manufactured into shawls; and its exports consist chiefly of fruit. The inhabitants are supposed to be worshippers of the Delai Lama. This country, since the British conquests, has been extended to the Himalaya Mountains, and has been penetrated by British functionaries, amongst others by Mr Williams; and from his information, and the drawings which he exhibited, the inhabitants seemed to Bishop Heber to resemble the Kalmucks in dress, countenance, and religion. Their written character is, however, different from the Mongolian. They carry on a pretty regular intercourse with Russia; and it is singular that sheets of gilt leather, stamped with the imperial eagle, were amongst the presents which the king of Lahdack sent when he offered his allegiance to the British government. The capital is of the same name; it is the mart of all the trade that is carried on in the country, and is the rendezvous of the merchants who travel from Hindustan to Yarkand in Chinese Tartary, whence they proceed in a body the greater part of the way along the banks of the Indus. The position of this place is extremely uncertain. According to the best maps, it is placed in long. 78. 3. east, latitude 35. 35. north, two hundred miles north-east from the city of Cashmere. These Tartars have showed themselves very friendly to the British; and their Khan, as is stated by Bishop Heber, sent a formal offer of his allegiance to the British government, which was declined. At a point above the town of Drans, in Little Thibet, the main stream of the Indus is met by a smaller river, which has been traced from Rodauk in Thibet, and flowing past Lahdack, the capital of Little Thibet, is then named the Lahdack River. Near to Lahdack it is joined by another stream from the north-west, which Lieutenant Macartney conjectures to issue from the Lake of Surikol. It was formerly thought that this river was one of the principal branches of the Ganges, but it is now ascertained to be a tributary of the Indus.

LAHIJAN, a town of Persia, in the province of Ghilan, once the metropolis of the province; but having revolted against Shah Abbas, it was taken and demolished, Lahore.

and has ceased to be of any importance. It is eight miles east of Reshd.

LAHORE, an extensive province of Hindustan, situated between the thirtieth and thirty-fourth degrees of north latitude. It has been estimated at 340 miles in length by 200 in average breadth. It is bounded on the north by Cashmere and the course of the Indus; on the south by Delhi, Ajmeer, and Moultan; on the east by the mountains of Northern Hindustan; and on the west it is separated from Afghanistan by the Indus. The principal geographical and territorial subdivisions are the Punjab, comprehending other minor subdivisions, and the Kohistan of Lahore. Into these two districts the country is nearly equally divided. The Kohistan is the mountainous tract which occupies the whole north-eastern division, and the Punjab is the flat country to the south-west, so called from the five celebrated rivers by which it is intersected. The mountainous district is not so fertile as the plains. On the sides, however, of those mountains, which are inhabited, wheat, barley, and various other small grains, are produced. There are spaces which project from the body of the hills, in separate flats, in the form of semicircular stairs. Into those projections the soil is propelled by the rains which fall in this quarter from June to October, and the earth washed down is preserved in that state by buttresses of stones. Rice is cultivated in the narrow valleys, but the inhabitants subsist chiefly on wheat-bread and peas made into a thick soup. Pines and willow trees grow on the face of the mountains. The resinous part of the fir is cut into slips, and supplies the place of a lamp. The climate is not favourable to fruits and vegetables. Fossil salt is found in many parts, and the mountainous tracts are supposed to be rich in minerals.

The flat country called the Punjab, or the country of the five rivers, is by far the most productive, though its fertility has been too much extolled, having been represented as the garden of India, which, under a good government, it might have been, from its advantageous situation and its numerous rivers. But it has been exposed to such various revolutions, and has been so much harassed by the contests of the petty Sikh chiefs by whom it is possessed, that it has not profited so much as might have been expected of its natural advantages; and accordingly, except in the immediate vicinity of the rivers, no portion of it is to be compared with the British provinces in Upper Hindustan, and still less with Bengal. The agricultural productions of the Punjab are, in general, wheat, barley, rice, pulse of all sorts, sugar-cane, tobacco, and various fruits. The province of Lahore is watered by the Indus, the Sutlege or Hysudrus, the Beyah or Hyphasis, the Ravey or Hydraotes, the Chinaub or Acesines, and the Jhylum or Hydaspes. That part of the Punjab east of the Jhylum, and the nearest to that river, which is flat, is chiefly pastured by herds of oxen and buffaloes; and that most to the east towards the Sutlege, which is wavy, though the most sterile in quality, is the best cultivated. East of the Jhylum there is not a hill; the trees are few, and cultivation is extremely scanty. It contains, however, many fine villages, and some large towns. But the latter, with the exception of Amritsir, the holy city of the Sikhs, are mostly tending to decay.

The commerce of this country was formerly much obstructed by the heavy duties levied on all the goods as they passed through the different territories of the petty Sikhs. It was in consequence carried to Hindustan Proper by the difficult and mountainous route of Jamboe, Nadone, and Serinagur. The Sikh chiefs, however, discovered their error, and many of these heavy and vexatious duties have been reduced; and, by a more strict administration of justice, confidence has been restored to the merchants. The exports from Lahore to the countries west of the Indus are, sugar, rice, indigo, wheat, and white cotton cloths. The imports from these countries are, swords, horses, fruit, lead, and spices. The exports to Cashmere are nearly the same as to Persia; the imports being shawls, a variety of cloths, saffron, and fruits. With Kohistan, the mountainous division of Lahore, the inhabitants of the Punjab exchange cloth, matchlocks, and horses, for iron and other smaller commodities. From the south are imported sulphur, indigo, salt, lead, iron, European coarse broad cloth, and spices. The exports to the south are, horses, camels, sugar, rice, white cloth, matchlocks, swords, bows and arrows.

Lahore.

Lahore contains a mixed population of Sikhs, Singhs, Jauts, Rajpoots, Hindus of lower castes, and Mahommedans; the latter a poor, persecuted, despised race, and not numerous. Few of their mosques have escaped destruction. The lower orders of the Sikhs are protected from the tyranny and violence of their chiefs by the precepts of their common religion, and by the privilege which they possess of abandoning a leader whom they dislike, the distance of a few miles placing them under the protection of his rival. In the Punjab it is reckoned that one third of the inhabitants are Singhs or Sikhs. A considerable number of cultivators are Jauts. The natives are composed of different classes of Hindus. Amongst the mountaineers the goitre or swelled throat is common. On the north-western borders of Lahore the inhabitants are chiefly Afghans, who live in small forts or walled villages, in mutual dread of each other. This quarter is exposed to the depredations of the Sikhs on the Attock and on the adjacent districts. In the Punjab, fakeers or religious devotees and mendicants are common, and are frequently seen travelling about in a palanquin clad in silk, with a great retinue of attendants on horse and foot. These are extremely proud, and in general insolent and abusive to Europeans. The Singhs are active and robust, and have in general the Hindu cast of countenance, somewhat altered by their long beards. They are very courageous, and, under the influence of prejudice or religion, are brave even to desperation. They are all horsemen, though they serve as infantry in foreign armies; of a bold and rough address, speaking invariably in a loud, bawling tone of voice.

Sikh, or Siksha, is a Sanscrit word signifying disciple or devoted follower. The founder of the sect was called Nanak, who was born at the village of Tulwundy, in the district of Bhatti and province of Lahore, A. D. 1419, and died at Kirthipoor Dehra, on the banks of the Ravey. He left two sons, from whom are descended 1400 families, called Shahzadehs, who are greatly respected, and live at Dera, in the Punjab. The descendants of this person ruled amongst the Sikhs, who, during the succeeding centuries, gradually increased in strength. Gooro Govind, who was expelled from Lahore during the reign of Aurungzebe, and is supposed to have died in 1708, new-modelled the government of the Sikhs, and converted them into a band of ferocious soldiers, changing their name from Sikh to Singh, signifying a lion. This person is revered by the Sikhs as the founder of their worldly greatness and political independence, as Gooroo Nanak is of their religion. After the death of Aurungzebe, the Sikhs grew in strength, and wasted the country. On the dissolution of the government which took place at Lahore subsequent to Nadir Shah's invasion of India, the power of the Sikhs increased; and, during the first invasion of the Afghans in 1746, they possessed themselves of a considerable portion of the country between the Ravey and Jallinder. In 1762 and 1763 they were almost exterminated by Ahmed Shah Abdalli and the Afghans; but by their undaunted resolution they still rose superior to their misfortunes, and at last succeeded in acquiring and consolidating their present territories. For many years prior to the appearance of Runjeet Singh, this whole country was distracted by the internal feuds that took place between the different chiefs, every village being an object of dispute between brothers and near relations. This powerful chieftain rose into political power from small beginnings. So recently as the year 1805, when Lord Lake advanced into the Punjab, he was contending for ascendency amongst merely rival chiefs. But between this and the year 1812, he had brought almost the whole of the petty princes in the Punjab under his authority, and was even encroaching to the south-east, beyond the boundary of the Sutlege, when he was opposed by the British, with whom, however, he showed not the least desire to contend. Being sensible of his own inability to oppose the British power, he willingly agreed to a treaty of alliance and friendship, by which the latter agreed to relinquish all concern with the territories of the rajah to the north of the Sutlege; and the rajah on his part agreed never to maintain, in the territories occupied by him or his dependents to the south of that river, more troops than were necessary to carry on the internal police of the country, and also to abstain from encroaching on the chiefs to the south of that boundary. Runjeet Singh is an ambitious chief, and he is extremely anxious to improve and increase the warlike resources of his kingdom. His troops are manœuvred according to the European fashion; they are drilled by European officers, and make a formidable appearance in the field. But they are still very far inferior to the British troops in India in all military qualities; and the Sikh monarch is too wary to risk his recently acquired power in such an unequal contest. He is perpetually endeavouring to extend his territories towards the south and east. He has made several attempts on the hilly country of Cashmere, which have all been unsuccessful. We have no accurate estimate of the population of the Sikh territories. It was the boast of these warlike tribes at one time that they could bring 100,000 horsemen into the field; but at present so large a force could not possibly be mustered among them.

Lahore, the capital of the above province, is situated on the south side of the Ravey River, which is here about three hundred yards wide. It is surrounded with lofty walls, decorated on the outside, but hastening to ruin, as are most of the private buildings. It is still a place of considerable size, with a good bazar; but it is not inhabited by wealthy people. On account of the frequent sackings it has sustained, they have migrated for safety to Amritsir. The palace was originally founded by Acbar, and enlarged by his successors. Across the Ravey, at Shah Durra, about two miles north of Lahore, stands the celebrated mausoleum of Jehangeer, within a wall of nearly 600 yards square. It is a magnificent building, sixty-six paces on each side, and still in very good condition. To the southward of this, in the open plain, is to be seen the tomb of Noor Jehan Begum, a building thirty-six paces square. In 1812 Runjeet Singh was building a very thick wall and rampart round the city, with a deep, broad ditch. The palace has also been surrounded by a deep and broad ditch, the whole faced with brick, and the earth thrown inwards, so as to form a broad rampart, with bastions at intervals. The city is verging to decay; yet the domes and minarets of the mosques, the lofty walls of the fort, the splendid mausoleum of Jehangeer, and the numberless inferior tombs and temples that surround the town, still render it an object of curiosity and admiration. Lahore was taken by Sultan Baber, A. D. 1520, and was for some time the seat of the Mogul government. Since that period it has undergone many revolutions, and was for a considerable time possessed by the Abdalli Afghans of Cabul, by whom it is named Sikrei. For the last thirty years it has been under the domination of the Sikhs, and has latterly been the headquarters of Rajah Runjeet Singh, the powerful chieftain of that predatory people. The travelling distance from Delhi is 380 miles, from Lucknow 639, from Bombay 1070, and from Calcutta 1356 miles. Long. 74. 3. E. Lat. 31. 36. N.

LAHR, a city of the duchy of Baden, in Germany, in the circle of Kinzig. It stands on the river Schutter, which runs to the Rhine, is surrounded with walls, and contains 600 houses, with 4660 inhabitants. It is a place of manufacturing industry, producing cotton and woollen goods, and various other commodities.

LAIBACH, or Laybach, one of the governments into which the Illyrian province of Austria is divided. It extends over 8394 square miles, and contains twenty-five cities, forty-two market-towns, and 5947 villages and hamlets, with 611,730 inhabitants. It is for the most part mountainous, except in the centre, where it is level and fertile. Its chief products are corn, fruit, wine, wood, iron, copper, and marble. The capital is a city of the same name, situated on the river from which that name is derived. It is well built, but antique, and contains a cathedral, with ten other catholic churches, two hospitals, 980 houses, and about 10,000 inhabitants. Above the town, on a hill on which it is built, is a strong fortress, at present appropriated to the confinement of criminals. There is a collegiate establishment, with a rector and twenty-one professors, who superintend the instruction of students in theology, philosophy, law, and medicine, and confer degrees in each of these faculties. There are manufactures of silk, of ribbons, of china-ware, of leather, and of various chemical productions; and an extensive trade is carried on with Italy, with Bavaria, and with Croatia. Long. 14. 41. 10. E. Lat. 46. 1. 48. N.

L'AIGLE, a city of France, in the arrondissement of Mortagne, and department of the Orne, situated on the river Rille. It contains 844 houses, and 5850 inhabitants. There are several manufacturers of linen and cotton goods; but it is especially celebrated for its needles, pins, and other small articles of iron and steel.

LAING, Malcolm, a distinguished constitutional lawyer and historian, was born on the 13th of January 1763, at Strynzia, his paternal estate, situated on the mainland of Orkney. He received the rudiments of his education at the grammar-school of Kirkwall; and, when he had attained the proper age, he was sent to the University of Edinburgh, where he completed his elementary studies. Here he not only made the acquaintance, but gained the friendship, of many young men of great promise, who afterwards rose to eminence in different walks of life. He was admitted a member of the Speculative Society, which had for its object general literature and science. It had been founded about twenty years before, and, during that period, numbered amongst its members all the distinguished youth of Scotland, as well as many foreigners of distinction. "Laing," says Sir James Mackintosh, "was most acute and ingenious, but his meaning was obscured by the brevity which he too much pursued in his writings, and by an inconceivable rapidity of utterance.[1]

Mr Laing passed as advocate in the year 1784. Whether he had any predilection for the profession of the law, or made choice of it merely for the respectability it confers, and the opportunity it sometimes affords of attracting notice as a politician, we have had no means of ascertaining. It seems certain, however, that notwithstanding his general talents, and his great powers as a close and vigorous reasoner, he was never much employed professionally, nor known as a successful practising barrister. It will not altogether account for this failure to attract business, that the manner in which he delivered his arguments was neither dignified nor pleasing; that, in fact, his speeches were uttered with an almost preternatural rapidity, in harsh and disagreeable tones. Such reasoning as he was accustomed to employ scarcely required the extraneous assistance of manner to recommend it, even to a jury; whilst, at the period in question, nearly all the pleading in Scotland was addressed solely to the judges, whose well-disciplined intellects might have been supposed more likely to acknowledge the force of reason and of argument, even when divested of all extrinsic attractions, than to be moved by rhetorical elegance or by holiday declamation. Laing has evinced, in his writings, an intimate acquaintance with almost all the departments of Scotch law; in treating historical subjects, he skilfully availed himself of this knowledge, as well as of the experience which he had acquired in his profession; and hence, taking all the circumstances into view, it may safely be concluded that the limited extent of his practice is to be attributed rather to his own choice than to any deficiency of talent or want of aptitude for conducting forensic business. Nor will this conclusion be weakened by the perusal of the admirable address which he delivered in defence of Gerrald, one of the foredoomed victims of the persecution that then raged against the advocates of a reform in the representation of the people; an address so clear and cogent in its reasoning, so irresistible in its deductions, that it must have carried conviction to all minds except those of a time-serving jury and of political judges.

---

[1] *Memoirs*, &c. vol. i. p. 27.

In 1790 or 1791, Mr Laing, and his friend Mr Adam Gillies, now Lord Gillies, took a house, which they furnished, and in which they continued to live together until the year 1801, when Mr Gillies married. During the whole of this period, Mr Laing was much engaged in researches relative to the history of Scotland; and in the course of it also, he formed an acquaintance and commenced a correspondence with Mr Fox, which appears to have continued with but little interruption until the death of that illustrious statesman.

The first fruits of his laborious investigations were employed in preparing for the press the last volume of Henry's History of Great Britain, which the author, at the time of his death, had left incomplete. The matter collected by Henry did not extend to a period at which the work could with propriety be terminated; and Mr Laing was requested by the author's executors to write two additional chapters, to which, when completed, he annexed a dissertation on the crimes attributed to Richard III. The labours of two such authors, so very different in their views, character, and style, could not be very aptly united in the same volume, much less amalgamate or coalesce into a whole; besides, many persons considered Mr Laing as an uncompromising liberal, whose historical deductions seemed harsh and prejudiced, when compared with the calm and subdued narrative of Henry. But, however dissimilar these writers may have been in their style and manner, as well as in their respective modes of treating historical subjects, there are few persons, at least in the present day, who will be disposed to give the preference to the latter. Henry was a man of good sense and considerable industry, but, of all our historians, perhaps he is the least philosophical; and if he appears calm and moderate, he does so because he is an entire stranger to strong opinions and strong sympathies. Laing, on the other hand, was a man of vigorous judgment and profound speculation; he had no taste whatever for the romance of history; and if he argued keenly in support of the opinions which he had adopted, he did so, not like a man who is determined to maintain a point merely because he had asserted it, and felt personally interested in showing it to be true, but as one who, having considered the matter maturely, had submitted it to the arbitration of his own judgment, and was resolved to annihilate all those prejudices which prevented others from seeing it in the same light in which it appeared to himself. It is absurd to blame an historian for his opinions, because that is equivalent to censuring him for his honesty; it is only when, as has sometimes happened, he distorts facts in order to support preconceived opinions, instead of regulating his opinions according to the ascertained facts, and taking care that the one shall be a legitimate deduction from the other, that he merits reproach and condemnation. The sole object of Mr Laing was to discover truth; and there can be no doubt whatever that he sought the truth in the love of it. It is not impossible that his prepossession in favour of the class of principles which he had adopted may, in some instances, have led him to deduce hasty or improper conclusions from the facts he had ascertained; but although the stern severity of his character was calculated to provoke opposition, and even to envenom criticism, no political adversary has ever accused him of perverting facts. His historical probity, indeed, has been tacitly recognised even by those who were most bitterly opposed to the opinions and doctrines which he laboured so strenuously to inculcate. To Mr Laing has sometimes been ascribed the Memoir of Henry, which accompanied the last volume of his History; but, if we are not greatly misinformed, it was drawn up by Sir Henry Moncrieff, the leading executor, by whom Mr Laing had been induced to write the continuation.

The publication of this work was partly the occasion of procuring Mr Laing the notice and acquaintance of Dr Parr. In an original letter, dated Hatton, near Warwick, 22d of March 1794, and addressed to Malcolm Laing, Esq. the latter says: "Often have I told our illustrious friend, Mr (afterwards Sir James) Mackintosh, of the pleasure and the instruction which I have received from your continuation of Dr Henry's History. I saw with delight the comprehensive and elevated views which your mind takes of general politics. I thought your statement of the controversy about Warbeck so correct, your proofs so apposite, and your reasoning upon them so acute and impartial, that not one lurking weed of a doubt will ever shoot up again in my own mind." And, in another part of the same letter, the writer adds, "The energy of your style, the extent of your inquiries, and the solidity of your observations, have increased the interest which I had long ago taken in the reputation of this history; and I am speaking from motives, selfish if you please, but such as no man of letters would deign to dissemble, when I express my earnest wishes that your professional engagements would permit you to finish a performance, in which you have already engaged so far as to impress every intelligent reader with the most favourable opinions of your taste, judgment, and comprehensive researches."

But the more immediate occasion of this letter was one which does infinite credit to the heart and the feelings of the distinguished writer, whilst it forms a sort of epoch in the career of Mr Laing. On the 3d of March 1794, Joseph Gerrald had, after a mock trial, been convicted of a crime which had no existence before, on a law created for the occasion, by a verdict pronounced without legal evidence. Mr Laing had been counsel for Gerrald, in behalf of whom he delivered one of the most able and convincing addresses that ever proceeded from the bar; and Gerrald, again, had been a favourite pupil of Parr, who, notwithstanding all his errors and follies, still retained for him the affection of a parent. "Gerrald," says he, in the letter already quoted, "Gerrald, whom you have protected as a client, I taught as a boy. Dissipated as he has been by the pleasures, and worn out by the cares, of a most unhappy life, he presents, and can only present, to your view the broken and deformed ruins of a mind originally great. But my recollection is often carried back to his better days; to the powers of his genius, when they were unfolding themselves in a genial and fruitful spring; to the beneficial and rapid effects of the culture I bestowed on them during their evolution; and to the rich harvest of knowledge which I once had in prospect for him, when time should have matured those talents which nature had conferred, and education cherished. In this season of sorrow, or, I should rather say, this crisis of danger, his follies and irregularities make me cling, with more eager efforts of remembrance, to the contemplation of endowments so blasted, and of virtues doomed so soon to decay. But forgive me, if, by associations so natural to a lettered mind, I find relief in turning aside from the horrors of his situation, to express my gratitude for the benevolence, and my veneration for the abilities, of that man, who has endeavoured to shield him from the merciless arm of oppression. You, sir, sympathise, as I do, with his sufferings. You are struck, like myself, with admiration, even at the diminished glories of his genius. You have defended him as I could not do, in the course of his trial. You visit him, as I wish to do, and you console him, amidst the gloom of his confinement. For all these masterly exertions, and all these humane offices, in favour of poor Joseph, I entreat you to accept the tribute of my praise and my thanks." This truly eloquent letter concludes with a most affecting prayer, that "when he (Gerrald) is removed to that dreary shore, from which he never will return, his spirit may not be broken down by the severities of banishment; that his misfortunes may lead him into a train of wise and virtuous reflection; that his old age may be calm; and that his death may be an hour of serenity and resignation." Mr Laing, in replying to this "inestimable letter," which has hitherto remained unpublished, observes, in reference to his ill-fated client:—"In the cause of liberty others may have experienced a punishment, severer if possible, not more iniquitous. Voluntarily to await a sentence which he foresaw was inevitable, and knew to be illegal, exalts him to the rank of the most illustrious martyrs of freedom, and will render his trial memorable, whether the constitution which he sought to regenerate shall perish or survive. In a remote exile, inaccessible unless to the prayers of his friends, he will enjoy the dignified consolation of having discharged his duty to society, and the conscious possession of a mind superior to vicissitudes, not to be broken by misfortune or woe."

But, to return from this digression, whatever defects some may have discerned in the continuation of Henry's History, the public generally appreciated the merit of the work, and honoured the author with its approbation. Thus encouraged, Mr Laing continued his historical labours, and, having directed his attention to his native country, published, in the year 1800, his History of Scotland, from the union of the crowns, on the accession of James VI. to the throne of England, to the union of the kingdoms, in the reign of Queen Anne: And this was accompanied with two dissertations, historical and critical; one on the Gowry conspiracy, and the other on the supposed authenticity of Ossian's Poems. As in the previous case of Dr Henry's History, this work proved very dissimilar in its character to that of which it was in fact intended as a continuation; we mean, the History of Dr Robertson. Of the elaborate elegance, the studied rhythm, the balanced cadences, and the academical polish, which distinguish the style of the latter, it is almost entirely destitute. It cannot be pronounced either harsh or inelegant, but it is certainly complicated; and, from the constant effort made to compress a great deal of meaning into few words, it becomes occasionally obscure. It is terse and vigorous, but hard and abrupt; without volume, fluency, or elasticity. The continuity is in the thoughts rather than in the expressions; the sequence of the ideas is complete, but their full development is often left to be supplied by the mind of the reader. In the art of narration, he is as much inferior to Robertson, as he surpasses him in all the higher attributes of a philosophical historian; in tracing events and actions to their true causes and motives, disentangling intricate and perplexed questions, sifting evidence, and steadily exploring his way through the mazes of contradictory testimony. In his remarks and reflections, he also displays a depth and originality of thought which Robertson could never have reached, as well as an adventurous boldness of speculation from which the latter would have shrunk with dismay. But his chief merits consist in the great critical power he displays in discussing complicated questions of evidence; in seizing and steadily keeping in view the strong points of each case, as it comes before him; in the mastery which he exercises over all the resources of analysis; in the inflexible perseverance with which he pursues his investigations; and in combining the acuteness of the practised lawyer with the discrimination of the close observer of human nature. Hence, the separate dissertations, though to some they may appear to contain nothing but special pleadings, are perhaps the most instructive as well as admirable portions of the work. Upon all subjects, indeed, the ruling spirit of the author prompted him to search for debated questions, few of which he has left without some sort of settlement of the point in dispute. In this manner he has treated many points in English history, and amongst these the celebrated question as to the authorship of *Eikon Basiliké;* a subject afterwards treated with consummate ability by his illustrious friend and countryman Sir James Mackintosh, and concerning which he proved that, whatever share Charles may have had in the original suggestion or even partial composition of the work, Gauden was the person who had prepared it for the press, and whose claims on this account were afterwards fully and liberally acknowledged.

Mr Laing appears also to have taken a peculiar pleasure in setting at nought local and national prejudices. Exulting in the free exercise of his strong reasoning powers, he scrupled not to attack prevailing opinions, however deeply rooted in the minds and affections of his countrymen, when he conceived that they were founded in error. This characteristic peculiarity is strikingly exemplified in his Dissertation on the authenticity of the Poems ascribed to Ossian. These productions required no depth of argument, no minute investigation of facts, to support their credit amongst an enthusiastic people, much more accessible to the impulses of feeling than the deductions of reason; whilst, on the other hand, those who questioned their genuineness shrunk from directly encountering what they naturally considered as unconquerable prejudices. But Mr Laing was not a man who would either acquiesce in a received opinion as such, or hesitate for an instant to bring it before the tribunal of reason; and, accordingly, he proceeded, without scruple or remorse, to examine the pretensions of Macpherson, on the broad and intelligible principle of an investigation into the facts upon which they were professedly grounded.

The arguments in this Dissertation may be resolved into three great classes or divisions. The first class consists of a logical examination of the arguments and proofs produced, or supposed to have been produced, in favour of the authenticity of the poems ascribed to Ossian, with a vigorous exposition of their errors and fallacies; but, as the author is necessarily obliged to confine himself to mere sceptical arguments, this is perhaps the least interesting and satisfactory part of the investigation. The second class of arguments, embracing those derived from contemporary documents and chronological facts, not only forms that portion of the subject in the treatment of which the extensive reading and discriminating sagacity of the author were most conspicuously displayed, but constitutes a body of evidence which finally demolished every pretence for considering the poems of Ossian as authentic translations of the productions of a Highland bard of the fourth century. The third division of the subject, containing an examination of the internal evidence furnished by the poems themselves, if not the most conclusive part of the inquiry, is certainly that which gives us the highest conception of the author's critical ingenuity, indefatigable industry, and searching spirit of investigation. He produces terms expressive of ideas which could scarcely be supposed or even imagined to have entered into the minds of the early and rude population of the Highlands; he points out similes, and trains of thought, derived or plagiarised from the writings of other authors, particularly from Virgil, Milton, Thomson, and the Book of Psalms; and, finally, he institutes a curious comparison between the method of arranging terms and expressing ideas in the poems of Ossian, and that which is exhibited in a forgotten poem, called *The Highlander*, published in early life by Macpherson,—pointing out many striking coincidences, and clearly establishing, to a certain extent, a complete identity of authorship. In short, the Dissertation, taken as a whole, though strained in some points, and overlaboured in others, presents a body of evidence and argument, which has completely satisfied all impartial persons as to the spuriousness of the pretended translations of Macpherson, and almost reduced the defenders of their authenticity to despair. The onset made by Johnson had proved entirely abortive, because it was a mere sudden ebullition, the offspring of passion and prejudice, rather than of inquiry or examination; but the attack of Laing was of a very different character; and being conducted in a scientific manner, by regular approaches from various points, it ultimately succeeded in demolishing every defence, and in forcing the defenders of Ossian to capitulate at discretion. "I was delighted and instructed by your History," says Dr Parr, in an original letter now before us, "and I sincerely think your remarks on Ossian one of the most able and satisfactory pieces of criticism I ever read; it amounts to demonstration, and does the highest credit to your sagacity and your knowledge."

But the author of this fierce attack upon one of the strongholds of Scottish national pride did not achieve his victory without suitable reprobation. The Highlanders were loud in their wailings, and the public prints teemed with ebullitions of their wrath. All their national feelings were excited into furious activity against the man who had dared to dispute the authenticity of Macpherson's pretended translations, which every Highlander was prepared to receive, with undoubting faith, as the genuine inspirations of Ossian. Mr Laing was regarded as a sort of monster, who, having no bowels of compassion, had set all feelings of patriotism at defiance. To many it seemed an anomaly in human nature, that a Scotchman should thus voluntarily undermine a fabric of national glory; and, unable otherwise to account for such sacrilege, they sought to discover in the author motives of petty rancour, local prejudice, and inconceivable animosity. Mr Laing's Dissertation, however, had the merit of eliciting a report by a committee of the Highland Society of Scotland, "appointed to inquire into the nature and authenticity of the poems of Ossian;" but although the inquiry was conducted under the superintendence of Mr Henry Mackenzie, and brought to light some curious facts previously unknown, it left the question as to the authenticity of Macpherson's pretended translations very much in the same situation in which it originally stood. Meanwhile, Mr Laing brought the controversy to a final issue by publishing a work, entitled the Poems of Ossian, containing the Poetical Works of James Macpherson, in prose and rhyme, with Notes and Illustrations, the nature of which may easily be conceived. This work is in fact a great literary curiosity. Like a victim decked out for immolation, it is conspicuously introduced to the world only to render its destruction the more signal and notorious. About the same time, an attempt was made to answer Mr Laing's argument, by a gentleman of the name of Macdonald; and, two years afterwards, an elaborate work, complacently termed a Confutation, was published by Dr Graham of Aberfoyle, who, however, gave a somewhat unlucky specimen of his qualifications for the task, by quoting, as authority concerning the Celts, the treatise of Tacitus *De Moribus Germanorum*, which refers entirely to the nations of Teutonic origin. Mr Laing did not feel himself called upon to answer an argument based upon such infelicitous and inapplicable authority.

His next work was one which, if possible, occasioned a still greater outpouring of wrath than his Dissertation on the Poems of Ossian. In 1804 he published a new edition of his History, to which he prefixed, in two volumes, a Preliminary Dissertation on the participation of Mary Queen of Scots in the Murder of Darnley. The object of this disquisition is declared in the title; and, throughout the whole detail, the author never for an instant deviates from the conclusion of guilt, which it is the professed purpose of his elaborate induction to establish. This, in fact, is the peculiar manner in which he has almost invariably treated controverted questions. Having first formed his own opinion from analytical investigation, he proceeds at once to establish it by synthetical probation; he arranges his documents and produces his arguments with the precision and conciseness of a practised logician; and, in the treatise in question, he no more hints at the possibility of the queen's innocence, than the crown-lawyer at that of the prisoner against whom he seeks for a verdict of guilty. He goes directly forward to his object, accumulating proofs or presumptions of criminality as he advances, till at length he carries our reason as it were by storm, and compels us, whether we will or not, to acquiesce in the judgment which from the first we had been prepared to hear pronounced. Few who have read this extraordinary production can ever forget the startling exactness with which the arguments are suited to the facts, or the strict accordance of the reasoning with all the details of the murder as given in the narrative of that event submitted to the reader. The reciprocal adaptation is in every respect complete; and hence the whole fabric must be overthrown together, or the joint force and full result of all must be unconditionally admitted. There is no other alternative, no intermediate term; Mr Laing grapples with his subject in such a manner as to render it impossible to withstand the force of his attack except by utterly destroying the assailant.

Hence it has been generally acknowledged that the effect of his reasoning is irresistible. "His inquiry into the controverted question of Mary's participation in the death of Darnley," says Dr Parr, "is minute without tediousness, and acute without sophistry. Whether I consider," adds he, "his sagacity in explaining causes, his clearness in relating facts, his vigour in pourtraying characters, or his ingenuity in unfolding and enforcing principles, I shall ever find reason to lament that the continuation of Hume's History was not undertaken by a writer so eminently qualified as Mr Laing for a work so arduous and important." In referring to the production in question, as one peculiarly characteristic of his genius, a very able writer in the *Edinburgh Review* employs still stronger language. "Mr Laing's merit as a critical inquirer into history, an enlightened collector of materials, and a sagacious judge of evidence," says he, "has never been surpassed. If any man," adds he, "believes the innocence of Queen Mary, after an impartial and dispassionate perusal of Mr Laing's examination of her case, the state of such a man's mind would be a subject worthy of much consideration by a philosophical observer of human nature." Sir James Mackintosh expresses an opinion equally decided, but much more specific and detailed, "I have just finished a careful perusal of your Dissertation on Mary," says he, in a letter to Mr Laing, dated Bombay, 28th of July 1807; "and I think myself bound to profess my shame for having ever doubted the atrocious guilt of that princess. Hume and Robertson are undoubtedly too mild. The original documents themselves cannot be read without conviction. Whoever doubts the genuineness of the long letter from Glasgow, or of Haubert's confession, must either be incorrigibly prejudiced, or altogether unaccustomed to the examination of evidence. If she were tried before me, I should certainly direct a jury to find her guilty. Her adversaries (with the exception of Murray) seem a detestable gang. Only think of the conferences at York and Westminster, in which there were at least two accusers, Lethington and Morton, who were more or less concerned in the murder; for, after all Morton's dying piety, by his own account, while his hands were reeking with Rizzio's blood, he haggles for a written warrant from Mary; he suffers at least the murderous plot to proceed for months, undisturbed by him, to its completion, and he at last acts a principal part in the collusive acquittal of the man whom he knew to be the murderer. Indeed the Scottish court and nation were then little less barbarous, bloody, and perfidious, than Abyssinia in the time of Bruce, though the literature of Buchanan, and the beauty of the unfortunate Mary, throw a little fallacious brilliancy around them."[1]

Besides the works already enumerated, Mr Laing edited *The Historie and Life of King James the Sext*, which was published at Edinburgh in the year 1804, from a copy of the original manuscript which David Crawfurd of Drumsoy, historiographer to Queen Anne, had employed in compiling his Memoirs of the Affairs of Scotland. The occasion of this publication arose out of the exposure made by Mr Laing, in his Historical Dissertation on the Murder of Darnley, of the real character of Crawfurd's work, and his "complete detection of the first of those literary forgeries for which the Scots are still so peculiarly distinguished." This he had announced without reserve in the Dissertation. "It is necessary to observe," says he, "that Crawfurd's Memoirs are a downright forgery, which has introduced much error into the present controversy. Having found a manuscript history of the times, he expunged every passage unfavourable to Mary, inserted every fact or assertion which he found in Camden, Spottiswood, or Melvil, whom he quotes on the margin as collateral authorities; and, after compiling Memoirs of his own, protests, that without wresting the words, he has adhered to the sense and meaning of the original. From Goodall's advertisement to the second edition, it appears that the manuscript was transferred to Mr Hamilton of Wishaw. On making proper inquiry, I had the good fortune to find it among the papers of his descendant, the present Lord Belhaven. From the same advertisement it appears, that Goodall collated Crawfurd's Memoirs, not only with Keith's copy, but with another of the same manuscript in the Advocates' Library;—nor had Goodall the honesty to explain the forgery which he must have perceived, or to state, in a single instance, the discrepancy between the manuscript and the printed Memoirs."[2] These severe strictures naturally provoked criticism, and Mr Laing was soon afterwards induced to publish *The Historie of the Life of King James the Sext*, as contained in the Belhaven manuscript, the avowed prototype of Crawfurd's Memoirs; a publication which he justly regarded not merely as a vindication of himself, but also as an instructive exposure of one of the grossest literary forgeries that have ever been employed to pervert the genuine history of Scotland.[3]

In the year 1805 Mr Laing married Miss Margaret Carnegie, daughter of Mr Thomas Carnegie of Craigo, a most respectable gentleman in Forfarshire, and sister-in-law to his friend Lord Gillies. He continued to reside chiefly in Edinburgh, until 1807, in which year he was chosen member of parliament for Orkney. He was then in a very indifferent state of health; but, during that one session, he occasionally attended his duty in parliament, where, notwithstanding the disadvantages of his manner, he was listened to with much attention and respect. These brief and irregular appearances may be said to comprise his whole career as a legislator; for, although he still continued a member, a serious illness, with which he was now seized, prevented his further attendance in parliament, and thus deprived the country of the services of one who thoroughly understood, and was eminently qualified to advance, its true interests. Whether from excessive study and exertion, or from original debility of constitution, he suffered severely from a nervous disorder, which committed frightful inroads on his already enfeebled frame, and ultimately reduced him to such a state of weakness, that he required to be supported by artificial means to prevent him from fainting. In 1810, his illness still continuing, he went to reside in Orkney, hoping no doubt to derive benefit from breathing his native air. Nor were these hopes altogether disappointed. By the cessation of laborious and exhausting intellectual exertion, and still more perhaps by the absence of excitement, his health was to a certain extent re-established; and as his ever active mind required, as a condition of health, employment of some description, he sought and found it in attention to the primitive occupation of mankind. From this period he devoted himself entirely to agricultural pursuits, in which he displayed his usual zeal, and in which, also, his labours were crowned with success. He farmed with advantage to himself, but certainly with far greater advantage to Orkney, into which he introduced many beneficial improvements, the general adoption of which is chiefly ascribable to his example. But his health, which had so long been infirm, continued to decline till November 1818, when he expired suddenly, without any suspicion having been entertained of the immediate approach of death.

---

[1] *Memoirs*, &c. vol. ii. p. 346, 347. "One reflection struck me," adds Sir James, in continuation. "In so small a town as Edinburgh then was, and at so little a court as that of Mary, I think it impossible that all the circumstances of a murder so long conspired, communicated to so many noblemen, and executed by so many of Bothwell's dependents, should not have very soon transpired, and been really known in the whole society, before any formal evidence of them was in existence. The contrivance of a false tale, the forgery of the letters, &c. were, in such circumstances, impossible. Haubert, the queen's valet, was a person of some consequence. The gentlemen who were Bothwell's retainers were still more so. Their confession, if forged, would have been contradicted by witnesses enough. I speak now with some little experience in such matters. I have been three years a criminal judge, and I know what becomes of *secrets* in small societies."

[2] Laing's *History of Scotland*, vol. i. p. 15, note.

[3] Preface to the edition of *The Historie* printed for the Bannatyne Club, pp. xvi. and xvii. "One of the immediate results of this publication (by Mr Laing)," says the learned and ingenious editor, "was the discovery of the Newbattle manuscript, by the late noble Marquess of Lothian, who, with that liberality of spirit which in him was native and indelible, did not lose a moment in communicating his discovery to Mr Laing; and, in 1806, Mr Laing, with his characteristic promptitude and zeal, had made preparations for printing the continuation of the work which this manuscript put into his possession, together with the corrections on his previous publication which it had enabled him to make. From this object, however, he was afterwards diverted by other more important pursuits; and it is now (1825) only, for the first time, that the entire History and Life of King James the Sixth has been given to the public." (Preface, *ubi supra.*)

Mr Laing was personally much esteemed, and, as an historian, greatly admired by Mr Fox, whose acquaintance he appears to have made some time in the year 1804. In a note prefixed to an interleaved copy of the first edition of the History of Scotland, containing Dr Parr's corrections, and dated on Good Friday 1803, the doctor says, "Mr Fox is a great admirer of your work, and he is also *puri sermonis amator*. I wish you were acquainted. As a critic, he is quite as captious and fastidious in protecting English idiom from Scottish invasion as I am." It would appear that not long afterwards the wish here expressed was realized. Mr Fox not only admired Mr Laing's work, but emphatically pronounced it a "treasure;" opening, as he said, new sources of interesting information; presenting new views of important transactions; and constituting a valuable acquisition to all who desire to obtain a true knowledge of the history of the nation of which it treats. The correspondence which passed between these distinguished individuals still remains unpublished, though it would no doubt form a very interesting addition to our stock of epistolary information respecting the history of the period to which it relates. During the time that Mr Laing represented his native county in parliament, and was permitted by the state of his health to attend to his parliamentary duties, he gave an active and zealous support to the short administration of his illustrious friend, of whose character and principles he was an ardent and devoted admirer.

The severity of Mr Laing's manner, the uncompromising nature of his opinions, the inflexible sternness of his principles, and the keen controversial character of his writings, all united to raise up against him a numerous host of adversaries, who but too often endeavoured to conceal their deficiency in knowledge and in argument by the bitterness of their scurrility, or the virulence of their abuse; but, in his private capacity, he appears to have had no enemies. On the contrary, he was much esteemed and beloved by his personal friends, all of whom that still survive agree in describing him as a single-hearted, upright, and truly honest man, who, to the courage necessary for asserting any truth however dangerous, or combating any prejudice however inveterate, added a higher and rarer endowment, namely, the magnanimity of acknowledging and correcting an error when it was distinctly shown to be such. He loved truth for its own sake; and though he delighted to discuss controverted questions both in history and in letters, he never contended for victory like a vulgar disputant, but only sought, by the honest means of research and reasoning, to disencumber such questions of the errors and fallacies with which he conceived them to have been overgrown, and to set before the world the uncorrupted truth in its native simplicity and purity. That his judgments were sometimes harsh, and his censure often unsparing, when the occasion seemed scarcely to require any great display of severity, is what his admirers have never denied nor attempted to conceal; but, on the other hand, it is proper to keep in view, that strong convictions naturally give birth to strong expressions, and that a mind at once actuated by the love of truth, rectitude, and liberty, and by an innate abhorrence of falsehood, iniquity, and oppression, could scarcely be expected, in surveying some of the darkest and blackest portions of our annals, to refrain from giving utterance to that moral indignation which every lover of freedom and of virtue must feel in contemplating the abuse of law, justice, religion, humanity, and government, for the purpose of enslaving and oppressing a whole people. Finally, to Mr Laing, more perhaps than to any other historian or critic of his country, belongs the undoubted merit of having cleared away much rubbish, removed much prejudice, refuted numerous and grave errors, detected not a few impostures, and, generally, placed both the characters and events of that portion of our national history of which he treats, in a clearer and more satisfactory light than he found them.

(See Parr's *Works*, edited by Dr Johnstone, vol. viii.; Field's *Memoirs of the Life, Writings, and Opinions of Dr Parr*, in two vols.; Pinkerton's *Literary Correspondence*, in two vols.; Original Letters of Dr Parr to Mr Laing; *Edinburgh Review*, vol. xliv. p. 37; *The Historie and Life of King James the Sext*, edited by Mr Laing, Edinburgh, 1804, in 8vo; *The Historie and Life of James the Sext*, with a short continuation to the year 1617, from the Newbattle Manuscript, printed for the Bannatyne Club, with a preface by the Vice-President, Mr Thomas Thomson, Edinburgh, 1825, in 4to; Laing's *History* and other Works, *passim*.) (A.)

LAIRESSE, Gerard, an eminent Flemish painter, born at Liege in 1640. He wrote an excellent book on the art, which was translated into English, and printed at London, both in 4to and 8vo.

LAIS, a celebrated courtezan, daughter of Timandra, born at Hycara in Sicily. It is said that she first began to sell her favours at Corinth for ten thousand drachmas. This gave rise to the proverb, *Non cuivis homini contigit adire Corinthum*. The success which her gallantries met with at Corinth encouraged her to pass into Thessaly, and more particularly to enjoy the company of a favourite youth called Hippostratus. She was, however, disappointed. The women of the place, jealous of her charms, and apprehensive of her corrupting the fidelity of their husbands, assassinated her in the temple of Venus, about 340 years before the Christian era. Some suppose that there were two persons of this name, a mother and her daughter.

LAITY, the people as distinguished from the clergy. The lay part of his majesty's subjects is divided into three distinct states; the civil, the military, and the naval.

LAKE, an extensive accumulation of water, wholly surrounded by land, and having no direct nor immediate communication with the ocean or with any seas, or having so only by means of rivers. Lakes are of various kinds, and have been divided into two classes, according to their situation and causes of production. Those which are formed in deep hollows between the ridges or at the bases of mountains, and which are supplied with water by springs or torrents, are classed together; and those which are formed in low and level countries by the surplus water of rivers, or from a want of sufficient declivity in the ground to allow the waters to continue their course, constitute a second class. But there are several other characteristics belonging to lakes, which justify a more minute division; and four distinct kinds have been recognised. The first class comprehends those which have no issue, and into which no running water flows. These, being generally diminutive in size, do not merit much attention. Some of them, as the Arendt, in Vieille Marche, are formed by the sinking down of the circumjacent lands; others, like the Lake Albano, near Rome, appear to be old volcanic craters filled with water. The second class consists of those lakes which discharge, but receive no running water. These are formed by springs, which, rising in a hollow place or reservoir, fill it before they find an outlet for their own waters. These lakes, however, are fed by small, almost invisible, streams, which descend from contiguous heights, or from subterraneous canals. Lakes of this description are often the source of large rivers, and they are naturally situated on great elevations. There is one of this kind on Mount Rotando, in Corsica, which is 9294 feet above the level of the sea. The third class, consisting of lakes which receive and discharge streams of water, is very numerous. Each of these lakes may be considered as a large basin or reservoir for receiving the accumulated waters of the neighbouring countries. They have in general only one opening, which almost always takes its name from the principal river which flows into it. These rivers are sometimes said to traverse the lakes; but this is scarcely correct, as their waters mingle with those of the basin over which they are diffused. These lakes have often sources of their own, either near the borders, or in their bottom. There are four or five lakes of this class in North America, which in magnitude resemble seas, but which preserve their clearness and sweetness notwithstanding, by the flow of a continual stream of fresh water. Sometimes a chain of lakes are connected with one another and with the ocean, by a series of rivers. This is the case with the great lakes on the northern frontier of North America, where basin succeeds basin on a lower level, like so many locks of a canal. A fourth class of lakes are those which receive streams of water, and often great rivers, without having apparently any outlet. These lakes are in general confined to warm climates; but the Caspian Sea, the largest of all lakes, belongs to this class. (See the article on the Caspian Sea.) There are a great many others besides in Asia; and South America contains the Lake Titicaca, which has no efflux, although it receives very considerable rivers into it. Such lakes appear to belong to the interior of great continents; they are placed on elevated plains, which have no sensible declivity towards the sea, and which do not allow of the water opening for itself a passage through which to flow out. It was long conjectured, that, by some subterraneous channel, lakes of this description communicated with the sea; but the fact that the surfaces of some of the most remarkable of them, such as the Caspian and the Dead Sea, are depressed below the level of the ocean, is quite sufficient to explode this hypothesis. For were there any communication, however small, the ocean would flow into the lake till it brought it to a level with itself. The true explanation seems to be, that a quantity of water equal to that which runs in is carried off by evaporation. The absorption of liquid by the contiguous land may also materially assist in carrying off the surplus fluid. There is another class of lakes, which differ materially from any of the preceding, namely, those which are contained in cavities quite covered over by earthy strata. These are probably very numerous, for it frequently happens, that after any violent convulsion of the globe, such as an earthquake, they become exposed to view; and, by the operations of mining, digging of wells, and the like, they have often been met with. Some of them appear to be the source of rivers, whilst others are known to receive very considerable streams, which lose themselves in the interior. Such are the numerous cavities of the Julian Alps. Certain lakes situated above ground periodically disappear; and their waters, it is most probable, flow into similar reservoirs. That very extensive subterranean cavities exist, is sufficiently attested by numerous phenomena. The disappearance of rivers, the waters thrown up by volcanoes, the sudden and terrible inundation of mines, the mountains which are suddenly engulphed in the bosom of lakes, and the springs of fresh water which spout up in the midst of the ocean, are all so many evidences of the fact. There is a district in the interior of Algiers, where the inhabitants, after digging to a depth of about two hundred fathoms, invariably come to water, which flows up in such abundance that they call it the subterranean sea.

The physical phenomena which certain lakes present are very remarkable, and were calculated to excite astonishment in an age when the operation of natural causes was not sufficiently attended to. Periodical lakes are the most common. Those which are formed by excessive rains, and which are evaporated by solar influence, are sometimes of great magnitude, as in tropical climates, where they cover spaces of several hundred leagues in length and breadth. Towards the poles they shrink into mere pools, scarcely worthy of notice. But there are lakes entirely independent of the rainy season, which appear and disappear at certain intervals, although these changes do not seem to take place at regular intervals. With regard to such sheets of water, Malte-Brun observes: "If there exist now in the numerous cavities of the earth subterraneous lakes of this kind, and if these communicate with other lakes which are visible, it is easy to imagine that the waters of these last may sometimes entirely disappear, by sinking down into the basin of the subterraneous lakes in proportion as they dry up. This lower basin again filling itself anew, the waters issue from it to fill the superior basin. If, in a supposable series of subterraneous cavities, the last link of the chain happen to be a mass of subterraneous water, situated at an elevated level in the bosom of a mountain, the periodical return of the waters in the visible basin may be accompanied by a motion similar to that of the spouting fountains. It is by means of such hydraulic machinery that nature keeps up the wonders of the lake of Cirknitz in Illyria, and in many others of the same description."

There are some lakes which present very remarkable phenomena, such as rising and falling like a tide, and boiling, and becoming agitated even during serene weather. Some of the Scottish lakes, and the Welter in Sweden, often experience violent commotion when the atmosphere is perfectly still. It seems highly probable that these agitations are connected with earthquakes in distant countries; and a coincidence in dates on certain occasions has given countenance to this belief. In Portugal there is a small lake or pool near Beja in Alemtejo, which emits a loud noise on the approach of a storm. Other lakes appear agitated by the disengagement of subterranean gases, or by winds which blow in some cavern with which the lake communicates. Near Boleslaw, in Bohemia, there is a lake of unfathomable depth, which sometimes in winter emits blasts of wind so strong as to elevate to some height ponderous pieces of ice. In the Marche of Brandeburg, the pool of Krestin often commences in fine weather to boil up in whirlpools, so as to engulph small fishing boats.

With regard to depth, lakes vary infinitely. In those situated in mountainous districts, it is remarkably great; that of Lochness, in Scotland, is one hundred and thirty fathoms in some parts. The general depth of the Caspian Sea is from sixty to seventy fathoms; but this increases towards the southern end to such a degree that no bottom can be found with a line of three hundred and eighty fathoms. The lake of Geneva attains the great depth of one hundred and sixty-one fathoms, and there are many others known to be exceedingly deep, without the amount being exactly ascertained. Several have passed for ages amongst the vulgar as bottomless; but this opinion, it is scarcely necessary to say, is unworthy of credit. Yet we are not to reckon as fabulous the accounts of lakes with double bottoms, which are said to be found in Sweden and elsewhere. This phenomenon is supposed to arise from interwoven roots becoming incrusted, and, being suspended near the bottom of a lake, rise and fall according to circumstances, thus causing the depth to vary in appearance In regard to the temperature of lakes, see the article Climate.

Distinct from any of the characteristics of lakes yet alluded to, is the chemical nature of their waters. Lakes, in respect to the quality of the waters, are distinguished into fresh, saline, and alkaline. Those which receive and discharge considerable quantities of fresh water are almost always kept themselves in a state of perfect freshness; but those which have no outlet are invariably saline. Thus the Dead Sea, whose waters have no efflux, and into which the river Jordan continually flows, contains about eight times as much salt as common sea-water. The waters of the Jordan are brackish, and the neighbouring soil is much impregnated with salt, so that the accumulation of such a quantity of saline matter in the lake, during a series of ages, is by no means surprising, for none of it ever passes off by evaporation. Salt must likewise be accumulating in beds at its bottom; for as soon as water is perfectly saturated, and can hold no more salt in solution, the latter must fall to the bottom. Some of the large Asiatic lakes are dried up during summer, and their beds appear lined with an incrustation of salt. All the great American lakes consist of fresh water; those of Europe are either fresh or slightly saline; but the Caspian Sea, and various others which are situated in plains full of salt, or in tracts of country where salt springs abound, are almost invariably impregnated with that substance. Some lakes are both saline and alkaline, as is the case with the Natron Lakes in Lower Egypt. They derive their appellation from their abounding in soda, which is there called *trona* and *natron*, the nitre of the Scriptures. Some lakes produce a pitchy substance. In the island of Trinidad there is one, on the surface of which an enormous quantity of bitumen, fit for naval purposes, is collected. Deposits of various kinds, besides those enumerated, seem to owe their origin to lakes. Bog iron-ore, or hydro-phosphate of iron, is often found in such situations as to show that it has been deposited from the waters of lakes; and in some countries it is collected from the sides and bottoms of lakes once in a certain number of years. Calcareous springs are numerous, and when the waters of these collect in a hollow place, so as to form a lake, quantities of calcareous sinters and tuffas are deposited, so that the lakes when emptied present extensive deposits of that mineral. The travertine employed at Rome for building is a lake or spring calcareous deposit of sinter and tuffa.

From the great changes which have been taking place for a series of ages, the number, the extent, and the situation of lakes must have from time to time been materially altered. That they occupied a greater extent of the earth's surface formerly than they do now, is quite consistent with geological phenomena. But the investigation of the subject belongs more properly to Geology, which see under the head of MINERALOGY. (R. R. R.)

LAKE, or *Lacque*, a preparation of different substances, which are formed into a kind of magistery for the use of painters. One of the finest and first invented of these was that of *gum lacca* or *lacque*, from which all the rest, as made by the same process, are called by the common name *lacques*. See LACCA.

LALANDE, JOSEPH JEROME LEFRANÇAIS DE, a most zealous and accomplished astronomer, born at Bourg en Bresse, on the 11th of July 1732, was the son of Peter Lefrançais, and Marianne Mouchinet, his wife.

His parents were in easy circumstances, and his education being somewhat too indulgent, the natural quickness and impetuosity of his temper was too little restrained. His earliest taste, like that of most other children, seems to have been for romantic tales; and he was fond of making little stories with such materials as he possessed, but their subject was chiefly religious. He was in the habit of living much with the Jesuits, and he imbibed from them a predilection for the pulpit. At the age of ten he used to amuse himself with making sermons, and preaching them to a select congregation. The comet of 1744, however, with its long tail, took more forcible possession of his imagination, and he watched it with the most unremitting attention. Having been sent to Lyons to continue his studies under the Jesuits there, he acquired a taste for poetry and eloquence, and was then inclined to devote himself to literature and to the bar; but an eclipse of the sun recalled his attention to astronomy. His parents wished him to follow the profession of magistrate, and with that view sent him to Paris; but he accidentally lodged in a hotel where Delisle had established an observatory, and this circumstance led him to become acquainted with that professor, and to attend his lectures. These lectures were by no means popular; and the want of a more numerous audience made it easy for the professor to accommodate his instructions to the fixed attention and rapid progress of his new pupil, who became singularly attached to his master, and to all the methods which he employed. Lalande attended, however, at the same time, the physico-mathematical lectures of Lemonnier, who was more in credit as a teacher, and who also took great pains for his improvement.

In the mean time he had completed his legal studies, and at the age of eighteen he was called to the bar as an advocate. His family was anxious for his return to Bourg; but just at that time Lemonnier obtained leave to nominate him as a substitute for himself on an astronomical mission to Berlin, where he was to make observations on the lunar parallax, corresponding with those which Lacaille was sent to the Cape to obtain. He was favourably received by Maupertuis, who introduced him to Frederic and his court; and was made a member of the Academy of Sciences at Berlin, when he was about nineteen.

He remained a year in that city, observing at night, and passing his mornings in the study of the integral calculus, under Euler's directions; and his evenings in the society of Voltaire, Maupertuis, D'Argens, and other men of talents. It was not likely that his intercourse with such persons would confirm the principles which he had imbibed from the Jesuits; his moral conduct, however, does not appear to have been influenced by his change of sentiments. After his return to Bourg, he pleaded a few causes to oblige his friends; but the success of his operations at Berlin obtained him speedily a place in the Academy of Sciences at Paris; for, in 1753, before he was twenty-one, he was chosen to fill up a vacancy in the department of astronomy, which had been open for some years. He soon afterwards offended his friend Lemonnier, by rejecting too harshly an unfounded objection of that astronomer to his method of computing the effect of the earth's ellipticity on the lunar parallax, which differed from Euler's formula. Lacaille, who drew up the report of a committee appointed on the occasion, decided in Lalande's favour; but Lemonnier remained dissatisfied, and would not see him for twenty years. He had some similar discussions, at a later period, with Duséjour, who was a little too severe in criticizing some of his approximations, as if they had been intended to be rigidly accurate; but their personal friendship remained unaltered.

For more than fifty years he continued to be a constant and voluminous contributor to the Memoirs of the Parisian Academy, as well as to other scientific collections. His investigations were always judiciously directed to the advancement of astronomy; but they can scarcely ever be said to have exhibited any marked features of talent, or of address, beyond what might be expected from the industry of a man of good ordinary abilities, confining himself almost entirely to one subject. He was always anxious to call the public attention to astronomy as a science, and to himself as an individual. Thus, on occasion of the transits of Venus in 1761 and 1769, he addressed a circular letter to most of the governments of Europe, on the importance of obtaining a multiplicity of collateral observations; and he received in reply several invitations from sovereigns whose countries were more favourably situated for the purpose than France, to come and make the observations in person. He thought it unnecessary, however, to leave Paris on the occasion. He contented himself with being the first to announce to the public the result of the most satisfactory comparisons; and his countrymen seemed to give him almost the whole credit of every thing that had been done by others in conformity with his suggestions. He was much mortified, however, in not receiving from Father Hell an account of the observations made at Wardhus; and he was afterwards greatly inclined to dispute their accuracy, because Hell made the parallax smaller than he did by $\frac{1}{5}$th of a second; whilst the mean of both results, which is 8, 6″, agrees extremely well with the most modern computations; but, in the end, he did justice to the importance of Hell's observations.

He was constantly in the habit of passing a few months every year with his family in the country, and he occasionally amused himself, in the course of these visits, with mineralogical excursions, and with chemical studies. He delivered, about the year 1758, an oration before a public assembly at Lyons, on the advantage of monarchy above every other form of government; he even adhered to a similar opinion, and expressed it openly, in times when nothing but his celebrity, as a man devoted exclusively to science, could have made it safe for him to declare it.

After having published the astronomical tables of Halley, he felt the necessity of a new collection, and determined to begin with those of Mercury, which he found the most imperfect. He pursued, for this purpose, a regular course of observations at the Palais Royal, where he used to go before sunrise, in the winter mornings, to see the planet in the twilight. Having occasion to refer to the observations recorded by Ptolemy, he found it necessary to refresh his acquaintance with the Greek language, which he had in some measure neglected. But, with all his labour and diligence, his tables of Mercury exhibited, in 1786, an error of forty minutes in the time of a transit. The circumstance mortified him extremely; but it led to a revision of the tables, and he afterwards succeeded in making them much more perfect. It must be recollected, that, in the time of Hevelius, a transit was anxiously expected for four whole days before it occurred.

He next undertook to improve the tables of Mars and Venus. His tables of these planets were, on the whole, less accurate than those of Mercury, though more exempt from great occasional errors. He had computed their perturbations in the Memoirs of the Academy, but he never thought it worth while to compare his formulas with observation. The irregularities of Jupiter and Saturn were much more discouraging; he was obliged to confine himself, in discussing them, to the most modern observations; and he did not appear sufficiently to appreciate the empirical equations of Lambert, though they greatly diminished the errors of Halley's tables.

When Maraldi had given up the management of the *Connaissance des Tems*, Lalande and Pingré were candidates for the appointment. Lalande succeeded in obtaining it; but he had the modesty to confess that the work would have been more accurately performed by Pingré, if his connection with the church had not, according to the rules of the academy, incapacitated him for the situation. He made the work, however, much more popular, as a miscellaneous publication, than Pingré was likely to have done; and he was less prejudiced than Pingré in the choice of his tables. He remained editor of the work from 1760 to 1775; it was conducted by Jeaurat from 1776 to 1787, and from 1788 to 1793 by Méchain. Lalande then undertook it once more, Méchain being engaged in some measurements with Delambre, and the academy having been abolished, and its members dispersed.

Lalande had been disposed to call in question the assertion of Newton and of Voltaire, that no comet could possibly come into contact with the earth; and he had proved that the effect of perturbations at least rendered their reasonings somewhat inconclusive. A short memoir on the subject, which was to have been read at a public sitting of the academy, was accidentally omitted, as not very important, from the pressure of other business. This circumstance alarmed the sensibility of the public of Paris, who fancied that Lalande had foretold some dreadful catastrophe, which the government was afraid to announce; and when the memoir was published, they insisted that its contents had been modified, to lessen the alarm. Duséjour made some objections to the author's reasoning; but the whole affair was soon forgotten.

A memoir on the length of the year was honoured with a prize by the academy at Copenhagen. Delambre, however, thinks the determination not so good as the earlier one of Lacaille, though much better than Mayer's, which was more commonly adopted. Lalande took great pains also with the subject of the sun's rotation, employing in his computations of the places of the spots an easy approximation, instead of Duséjour's more laborious methods; but being careful to compare with each other the most distant observations of the same spot. From the existence of this rotation he thought it reasonable to infer that the sun had also most probably a progressive motion, which would naturally be produced by any single impulse capable of occasioning a rotation. He had some discussions with Dr Maskelyne respecting the mode of computing the equation of time, in which Maskelyne appears to have had the advantage.

In the year 1762, Delisle resigned in his favour the professorship of astronomy in the College de France, which he kept for nearly forty-six years. He allowed the most attentive of his pupils to board with him at a cheap rate, doing his utmost on all occasions to promote their success in their studies and in life. Thus he brought forward Méchain and Dagelet, and afterwards his own nephew, who completed, with so much diligence and accuracy, the Description of the Heavens, which he had himself projected, and which had been begun by Dagelet before his unfortunate expedition. He was made a fellow of the Royal Society of London in 1763.

His health was generally good, though his constitution was delicate. He had an attack of jaundice in 1767, which was attributed to intense application; but he completely recovered from its effects by an attention to diet, and by the use of horse exercise. He then intended to leave all his property to the academy; but he afterwards gave up his family estates to his relations, and lived on his appointments only, refraining from all kinds of luxuries, in order to be the more able to do acts of liberality to his friends, whom he always sought to oblige in the most delicate manner, and often without making his services known. He had a pension from Russia in the time of the Empress Catherine; it was suspended by Paul, but restored in 1805 by Alexander.

He was not particularly successful as an observer, but used to refer to the works of his contemporaries, Bradley and Lacaille, though not exactly, according to the expression of one of his biographers, "as Ptolemy had done to those of Hipparchus;" for Hipparchus must have been dead two centuries before Ptolemy was born. On the occasion of the disappearance of the ring of Saturn in 1774, he went to Béziers, in order to profit by the superior serenity of the air there, the climate of that country being supposed to be the best in France; but his observations were less valuable than others made at Paris and in London.

In the year 1798, he undertook an astronomical expedition to Gotha. He had once meditated an aerostatical voyage there; but his companion took care that their dangers should terminate in the Bois de Boulogne. He was received with much interest at Gotha by an assembly of astronomers that was collected from different parts of Germany. The object of the congress was perhaps not unmixed with personal vanity; but it had no political design to promote, unless the general adoption of the new French measures could be considered as a political object. Lalande was by no means a revolutionist; he was sufficiently free from any prejudices of education; but he openly condemned the political opinions of the day; and, in 1792, he even exposed himself to great personal danger in order to save the life of Dupont de Némours, after the 10th of August; and he was equally useful to some of the clergy, whom he concealed in the buildings of the Observatory at Mazarin College, making them pass for astronomers. He had also the courage to publish accounts of Lavoisier and Bailly, a short time after their deaths.

The attentions of the German astronomers gave him sincere pleasure. He was at all times extremely sensible to compliments, and even to flattery, though very regardless of satire. He used to call himself a sponge for praise, and an oil-cloth for censure. He professedly believed himself endowed with all the virtues, modesty not excepted. He was so fond of notoriety that he once undertook to exhibit the variations of the light of Algol to the public of Paris on the Pont Neuf; but the police interfered, thinking it right to prevent a disorderly assemblage.

Though Lalande can only be classed in the second rank as an inventive astronomer, or a mathematician, he certainly stands in the first as a professor and a popular writer. His methods of calculation have in most instances been already superseded by others more convenient or more exact; those which related to particular phenomena for want of sufficient precision, and those which were more general for want of being readily applicable, without continual repetition, to a sufficient number of concurring observations. It has been observed, that he may perhaps have been often too zealous in the pursuit of his favourite objects; but that, if he had possessed more circumspection, and less vivacity of character, he would have been more exempt from criticism, yet would have rendered less important services to science and to mankind.

His last illness was of a consumptive nature, and he seems to have accelerated its termination by attempting too much to harden himself. He died on the 4th of April 1807, nearly seventy-five years old, and in the perfect possession of his faculties. His last words, when he dismissed his attendants to rest, were, "I have need of nothing more," and in a few minutes he was dead. Had he survived a few hours, he would have received a letter from Dr Olbers, announcing the discovery of a new planet, for which that distinguished astronomer afterwards received the fourth prize medal upon the institution founded by Lalande in 1802, for the most important astronomical discovery made in the course of the year.

Of his voluminous and diversified publications a simple enumeration of the subjects will perhaps be thought too long for perusal, though not improper for insertion in a work which ought to comprehend a complete literary history or bibliography of the sciences.

1. We find, in the *Memoirs of the Parisian Academy of Sciences* for 1751, an account of his Observations at Berlin, which also appears in the *Memoirs of Berlin* for 1749, and a Latin translation in the *Acta Eruditorum* for August 1752. 2, 3. 1752–53, An Essay on the Lunar Parallax. 4. 1754, A Transit of Mercury. 5. Elements of Mars. 6. 1755, Longitude of Berlin. 7. Lunar Eclipse. 8. 1756, Transit of Mercury. 9. Lunar Parallax continued. 10. 1757, Observations at the Luxembourg. 11. Transit of Venus. 12. Secular Equations and Mean Motions. 13. A Gnomonical Problem. 14. Meridian Altitudes. 15. 1758, Perturbations of Mars by Jupiter. 16. Motions of the Planetary Nodes. 17. Change of Latitudes of the Stars. 18. 1759, Comet of 1682 and 1759. 19. 1760, Sun's Diameter. 20. Perturbation of Venus by the Earth. 21. Eclipse of 1760. 22. 1761, Solar Parallax. 23. Interpolation. 24. Transit of Venus Observed. 25. Solar Parallax. 26. Transit Computed. 27. Observed at Tobolsk. 28. In Denmark. 29. Compasses, and the Variation. 30. Perturbation of Mars by the Earth. 31. Planetary Nodes. 32. 1762, Equation of Time. 33. Obliquity of the Ecliptic. 34. Horary Motion in Transits. 35. Nodes of Jupiter's Satellites. 36. Diameter of Venus. 37. Comet of 1762. 38. 1763, Eclipses of Jupiter's Satellites. 39. Solar Eclipses for a Spheroid. 40. Triangles, Rectilinear and Spherical. 41. 1764, Transit of 1769. 42. Lunar Libration. 43. 1765, Motion of Saturn. 44. Eclipses of Jupiter's Satellites. 45. The Third Satellite. 46, 47. 1766, Theory of Mercury. 50. 1768, Opposition of Jupiter. 51. Transit of 1769. 52. Orbit of Saturn. 53. 1769, Lunar Observations. 54. Comet of 1769. 55. Transit of Venus. 56. A Solar Eclipse. 57. Transit of Venus. 58, 59, 60. Comparisons of Observations. 61. 1770, Solar Parallax. 62. Sun's Diameter. 63. Appearances in the Transit. 64. Chappe's Observation. 65. 1771, Theory of Mercury. 66. Astronomical Observations. 67. Solar Parallax. 68. 1772, Transit of Venus. 69. Tides. 70. 1773, Comets. 71. Saturn's Ring. 72. 1774, An Opposition of Saturn. 73. Saturn's Ring. 74. Disappearance of the Ring, at Beziers. 75. 1775, Opposition of Mars. 76. Elements of Mars. 77. Same Latitudes and Longitudes. 78. Opposition of Jupiter and Saturn. 79. An Eclipse of Saturn. 80. 1776, Spots and Rotation of the Sun. 81. 1777, Observations at Paris and Madrid. 82. An Observation of Mercury. 83. Longitude of Padua. 84. The Solar Spots, continued. 85. 1779, Third Satellite of Jupiter. 86. Theory of Venus. 87. Herschel. 88. 1780, Obliquity of the Ecliptic. 89. Precession of the Equinoxes. 90. Fourth Satellite of Jupiter. 91. 1782, Duration of the Year. 92. A Transit of Mercury. 93. 1783, An Eclipse of the Sun. 94. Inclination of the Orbits. 95. 1784, Elements of Jupiter. 96. Ellipticity of the Earth. 97. 1785, Motion of Venus. 98. 1786, Secular Equations of the Sun and Moon. 99. Mass of Venus. 100. Equation of Mars. 101. Mars in Quadrature. 102. Orbit of Saturn. 103. Theory of Mercury, fifth Memoir. 104. Satellites of Jupiter. 105. Fifth of Saturn. 106. 1787, Fernel's Measurement. 107. Herschel's. 108. Jupiter's Third Satellite. 109. Conjunction of Venus. 110. Motion of Saturn. 111. Inclination of Saturn. 112. Answer to Lemonnier, on Lunar Observations. 113. Solar Eclipses of 1787. 114. Eclipse of 1666. 115. Caspian Sea. 116. 1787, Eclipse of 1765. 117. 1788, Eclipses applied to Longitudes. 118. Conjunction of Venus. 119. Lunar Parallax, fourth Memoir. 120. Moon's Diameter. 121. Jupiter's Fourth Satellite. 122. Satellites of Saturn. 123. Light of Algol. 124. Height of the Seine. 125. 1789, Epacts. 126. Observations of 8000 Stars, first Part. 127. Motion of Venus. 128. Astronomical Observations. 129. Observation of Mercury. 130. Tides. 131. Catalogue of Stars, second Part. 132. 1790, Disappearance of Saturn's Ring. 133. Interior of Africa. 134. *Mém. Inst.* i. 1798, Orbit of Mercury. 135. ii. 1797, Occultations of Aldebaran. 136. Solar Eclipse of 1706. 137. Solar Eclipse of 1748. 138.

v. 1803, Zodiac at Strasburg. 139. Eclipses calculated. 140. Opposition of Mars. 141, 142. Motion of Venus. 143. Motion of Mercury. 144. vi. 1806, A Transit of Mercury.

145. The earliest of his separate publications appear to have been two little volumes, intended for provincial circulation only, entitled Etrennes Historiques, 24. Par. 1755–56. 146. Another little article of his miscellaneous works was a Discours qui a remporté le Prix de l'Academie de Marseille en 1757, Mars. 1757. The subject was the spirit of justice, as tending to the glory and the stability of a government. 147. We have then Three Letters on Platina, *Jour. des Sav.* 1758, Jan. Jun. 1760, Feb. 148. Letter on a new Sun Dial, *Jour. Sav.* Jun. 1758, ii. 439; the lines being invisible when the sun does not shine.

149. Tables Astronomiques de Halley, 2 vols. 8. Paris, 1759. Containing several new tables, and an elaborate history of the comet of 1759, of which the author had computed the perturbations, according to the theory of Clairaut. 150. Connaissance des Tems, 16 vols. 8vo, Par. 1760–1775; 14 vols. 1794–1807. This work contains, besides, the Ephemeris, an important selection of the most useful astronomical papers. On one occasion, for temporary reasons, these papers were published in a separate volume. 151. Exposition du Calcul Astronomique, 8. Paris, 1762; a companion to the almanac.

152. Oraison funèbre de Maurice Comte de Saxe, 8. Par. 1760. 153. Art du Papetier, f. Par. 1761. 154. Parcheminier, 1762. 155. Cartonnier, 1764. 156. Chamoiseur, 1764. 157. Tanneur, 1764. 158. Mégissier, 1765. 159. Maroquinier, 1766. 160. Hengroyeur, 1766. 161. Corroyeur, 1767.

163. Letter on Delisle's Calculations, *Journ. Sav.* Apr. 1761. 164–5. In the 52d volume of the Philosophical Transactions for 1761 and 1762, we find several papers of Lalande; two on the transit of Venus; 166. one on Norwood's Measurement of the Earth; 167. An Account of a Comet; and, 168. An Account of Occultations of the Fixed Stars by the Moon. 169. In the Transactions for 1769, another paper on the Transit of Venus.

170. Discours sur la Douceur, 1763. This essay was intended as a sort of exercise for the author's own moral improvement; and he made it a rule to read it over every year, in order to assist him in commanding his temper. He may possibly have derived some little advantage from the practice, but he never acquired enough of self-command to refrain from wounding the feelings of another, by any pointed remark that might suddenly occur to him.

171. Astronomie, 2 v. 4. Paris, 1764; 3 v. 1771, 1792; vol. iv. 1780, not reprinted. This compilation far excelled in utility all former works of the kind, and will always be considered as exhibiting the most perfect picture of the science, such as it existed from 1760 to 1790, with all the details of practice and computation. Lemonnier called it, with some truth, the great newspaper of astronomy. The Treatise on the Tides, which constitutes the fourth volume, is chiefly a collection of observations, not sufficient even for the basis of a complete theory: an abstract of it may be found in the *Mém. Acad.* Dijon, ii. 1774. 172. Figure du Passage de Venus de 1769, Paris, 1764; together with an explanatory memoir. 173. On the Equation of Time, *Recueil pour les Astronomes*, 1765.

174. He undertook the mathematical department of the Journal des Savans, from 1766. 175. On the Coins of Piedmont, *Journ. Sav.* Dec. 1767. 176. Voyage d'un François en Italie, 8 vols. 12mo: a correct guide and faithful repertory for travellers, containing some scientific information, besides maps of the principal cities. 177. Dissertation sur la Cause de l'Elévation des Liqueurs dans les Tubes capillaires, 8. Par. 1770. 178. A Dictionary of Astronomy, in the *Encyclopédie d'Yverdun*, 56 v. 4. 1770–6. 179. Abrégé d'Astronomie, 8. Par. 1773, 1795; translated into various languages. 180. Notes on the Mondes Primitifs of Fontenelle, 24. Paris; often reprinted. 181. Notes on Bouguer's Traité de Navigation. 182. Mémoire sur le Passage de Venus, 4. Par. 1773; with a life of Dr Bevis. 183. Réflexions sur les Comètes qui peuvent approcher de la terre, 8. Par. 1773. 184. Lettre à Cassini sur l'Anneau de Saturne, 8. Toulouse, 1773; a violent attack, which was speedily suppressed by the author. 185. Ephemerides, 3 vols. vii. viii. ix. Paris, 1774, 1792. This was a continuation of Lacaille's computations, containing also some detached articles of importance; for instance, Hampstead's Catalogue, in the eighth volume. 186. A Celestial twelve-inch Globe, Paris, 1775.

187. The astronomical articles in the Supplement of the Old Encyclopédie, about 1776; those of D'Alembert, in the body of the work, having been little more than extracts from Lemonnier. 188. To the Encyclopédie Méthodique Lalande contributed a Dictionary of Astronomy, making about one third of the Mathématiques, 3 vols. 4to. They were principally extracted from his own astronomy; and the article Cadran, which is very elaborate, was originally intended for a fifth volume of that work.

189. Traité des Cannaux de Navigation, f. Paris, 1778. This volume is principally descriptive, especially of the Canal of Languedoc. 190. Letter on the Variation of the Compass, as connected with the Temperature of the Earth, *Journ. Sav.* 1780. Sept. 191. Leçons d'Astronomie de Lacaille, 8. Par. 1780; with some Notes. 192. Astronomie, in *Bibliothèque des Dames*, 12. Par. 1786, 1795.

193. Letter on the name of the planet Herschel, *Journ. Sav.* 1789; objecting to "Uranus." 194. Déscription d'une Machine de M. Ramsden, 4. Paris, 1790; the dividing engine, translated. 195. Account of nine Lalandes, *Journ. Sav.* Nov. 1791. 196. Journey to Manheim in 1791, *Journ. Sav.* 1791. 197. On the Zodiac at Strasburg, *Journ. Sav.* 1791.

198. Abrégé de Navigation, 4. Paris, 1793; with a full catalogue of works relating to the subject, and many useful tables. 199. A Journey to Mont Blanc, performed in 1796, *Mag. Encycl.* ii. iv. 433. 200. Histoire Céleste Française, i. 4. Par. 1801; containing the catalogue of stars begun by Dagelet, and continued by Michel Lefrançais Lalande, the nephew of the editor. 201. Continuation of Montucla's *Histoire des Mathématiques*, 2. v. 4. Par. 1802; making the third and fourth of that elaborate work, but not equally well digested and discussed with the original part. 202. Tables de Logarithmes, 18. Par. 1802. 203. Four Memoirs on Ceres, *Journ. Phys.* 1802. 204. Some articles in the *Necrologie des Hommes Célèbres*. He wrote, at different times, Accounts of the Lives of Vicq d'Azyr, Delisle, Commerson, Verron, Me. Lepaute, and Dubocage; and he had undertaken a life of Bucholz, a short time before he died. Commerson had complimented him by making a genus Lalandia, transgressing in his favour the classical canon of the botanists, to reserve such honours for the reward of merit in their own department.

205. Bibliographie Astronomique, 4. Paris, 1803; with a history of the Progress of Astronomy from 1781 to 1802. This useful volume was printed at the public expense, under the auspices of François de Neufchateau. The author possessed a very extensive collection of astronomical books, and it has been regretted that he did not insert a more complete account of some of the most rare; but the work is already sufficiently voluminous. Some other productions are attributed to him in the *Dictionnaire des Anonymes;* but they would probably have added little to his fame had they been acknowledged.

(Delambre, *Mém. Inst.* viii. 1807. H. P. 30; and Biographie Universelle, xxiii. 8vo, Paris, 1819. Ma. C. de Salm, *Magas. Encycl.* 1810, ii. p. 288; including a sketch by himself, written in 1804.) (L. L.)

LAMA is the name of the sovereign pontiff, or rather god, of the Asiatic Tartars. He is never to be seen but in a secret place of his palace, amidst a great number of lamps, sitting cross-legged upon a cushion, and adorned all over with gold and precious stones; and at a distance his worshippers prostrate themselves before him, it being unlawful for any to kiss even his feet. He is called the *great lama*, or *lama of lamas*, that is, priest of priests. The orthodox opinion is, that when the grand lama dies, either of old age or infirmity, his soul in fact only quits a crazy habitation to look for another younger or better; and it is discovered again in the body of some child, by certain tokens known only to the lamas or priests, in which order he always appears.

LAMANON, Robert Paul, a celebrated naturalist, was born at Salon, in Provence, in the year 1752, being descended of a respectable family. He was destined for the church, and sent to Paris to study divinity; but the acquaintance of philosophers having induced him to relinquish theological pursuits, he turned his attention to chemistry and mineralogy. Yet he afterwards became a canon in the church; but the death of his father and elder brother caused him to resign an office to which he was never attached, and he now possessed the power of directing his own future exertions. One amiable trait in the character of Lamanon is worthy of notice, and that is, that he refused to accept of his paternal inheritance except as an equal sharer with his brothers and sisters. When offered a considerable sum to resign his office of canon in favour of a certain individual, he replied, "The chapter of Arles did not sell me my benefice; I shall therefore restore it in the same manner that I received it." Anxious to remove the veil which conceals the secrets of nature from mortal eyes, he travelled through Provence and Dauphiné, and scaled the Alps and Pyrenees. He reached the summit of rocks, and explored the abysses of caverns, weighed the air, analysed specimens, in short considered himself as qualified to form a new system of this world. After a time he returned to Paris, and thence proceeded to England; and although he was in imminent danger of being overwhelmed by the ungovernable fury of the waves, he ordered himself to be tied to the mainmast, that he might be enabled to contemplate more at leisure this grand and terrific spectacle. Instead of being dismayed, he was transported with the tremendous roar of thunder, the vivid flashes of lightning, and the glancing spray with which he was almost incessantly covered; and, in his own estimation, this was the most exquisite day which he had ever enjoyed. During the time which Lamanon afterwards spent at Paris, he became one of the founders of the Museum. Having resolved to revisit Switzerland and Italy, he went first to Turin, where he joined himself to the learned of that country. From Piedmont he proceeded to Italy, returning by the way of Switzerland, where he explored the Alps, and ascended to the top of Mont Blanc; and on his return to Provence with the spoils of the countries which he had visited, he arranged the interesting fruits of his journey. Whilst Lamanon was preparing for the press his work on the Theory of the Earth, the French government conceived the design of completing the discoveries of Captain Cook, and the Academy of Sciences was charged with the selection of men qualified to rectify our notions of the southern hemisphere. Condorcet therefore made choice of Lamanon for advancing the progress of natural history connected with this great enterprise, and he received the invitation of that philosopher with the most eager transport. He set out for Paris, refused the salary offered him, took leave of his friends, and went directly for Brest. The armament, under the command of the justly celebrated but unfortunate La Perouse, set sail on the 1st of August 1785; and having reached the island of Maouna, Lamanon went ashore with the crew of two boats, where he fell a sacrifice to the fury of the savages, bravely fighting in his own defence to the last.

LAMAY, an island in the Eastern Seas, five or six miles in circuit. It is four leagues distant from Formosa, and is inhabited and cultivated. Lat. 22. 22. N.

LAMB, in *Zoology*, the young of the sheep kind. See MAMMALIA.

Scythian LAMB, a kind of moss, which grows about the roots of fern in some of the northern parts of Europe and Asia, and sometimes assumes the form of a quadruped, so called from a supposed resemblance in shape to that animal. It has something like four feet, and its body is covered with a kind of down. Sir Hans Sloane read a memoir upon this plant before the Royal Society, for which those who think it worth while may consult the *Transactions* (No. 245, p. 461.) Mr Bell of Antermony, in his very instructive "Account of a Journey from St Petersburg to Ispahan," informs us that he searched in vain for this plant in the neighbourhood of Astrakan, and that the more sensible and experienced amongst the Tartars treated the whole history as fabulous.

LAMB, *Charles*, a distinguished essayist and critic, was born in the Temple, London, on the 11th of February 1775. He was presented to the school of Christ Hospital in 1782, some recollections of which place he afterwards embodied in one of his most delightful essays. In November 1789, having completed the usual period allotted for education at that seminary, he returned to the home of his mother, who still resided in the Temple, although his father was now no more. At first he was employed for a short time in the South Sea House with his brother; a graphic and admirable account of which establishment he afterwards gave, in an essay of the same name. On the 5th of April 1793, he obtained an appointment in the accountant's department of the India House, where he remained till 1825, when he was allowed to retire on a handsome pension. The events of his life of a domestic nature are of little moment, and need not detain us in sketching his literary career. His first appearance as an author was in a small volume of poetry, published by his friend Coleridge in 1797, to which he contributed various pieces. A few years afterwards appeared "Old Blind Margaret, and Rosamund Gray," a tale of great simplicity, sweetness, and pathos. In 1802 he published "John Woodvil, a tragedy," alongst with "Fragments of Burton," one of his favourite authors. "Mr H———," a farce, was acted at Drury Lane in 1806, without success. It is, however, probably the best dramatic *jeu d'esprit* in the language; but it wants plot and incident for the stage, and its jokes are too intellectual to be appreciated by a mixed audience. In 1808 appeared his "Specimens of English Dramatic Poets who lived about the time of Shakspeare, with Notes," chiefly critical. In the year 1811 he contributed to the "Reflector" a series of admirable prose papers, including those on Hogarth's pictures and the tragedies of Shakspeare. The most celebrated of all Mr Lamb's works, the "Essays of Elia," were published in various periodicals between the years 1820 and 1833; and were subsequently collected and given to the public in two octavo volumes. In 1830 appeared his small volume of poems called "Album Verses," which also contained "The Wife's Trial," a dramatic poem, founded on Crabbe's "Tale of the Confidante." In conjunction with his sister, he also compiled three very popular books for children, namely, "Mrs Leicester's School, or the History of several young Ladies, related by themselves;" Tales from Shakspeare;" and "The Adventures of Ulysses." He

Lamballe.

likewise wrote another farce called "The Pawnbroker's Daughter, or the Reprieved Man," founded on his amusing paper, "On the Inconveniences of being hanged;" and to several periodical works he contributed various criticisms on the drama and the fine arts. His volume bearing the title of "The last Essays of Elia" appeared in 1833; and its publication he did not long survive, having died on the 27th of December 1834.

In depth of thought and splendour of genius, Charles Lamb was surpassed by several of his contemporaries; but as an essayist, he is entitled to a place beside Rabelais, Montaigne, Sir Thomas Browne, Steele, and Addison. He unites many of the characteristics of these several writers. He has refined wit, exquisite humour, a genuine and cordial vein of pleasantry, and heart-touching pathos. In the latter quality his Rosamund Gray will stand a comparison with any piece of the kind that ever was written. His fancy as an essayist is distinguished by great delicacy and tenderness; and even his conceits are embued with human feeling and passion. He had an extreme partiality for our earlier prose writers, particularly for Fuller, Sir Thomas Browne, and Burton, as well as for the dramatists of Shakspeare's time; and the care with which he studied them is apparent in all he ever wrote. It shines out conspicuously in his style, which has an antique air, and is redolent of the peculiarities of the seventeenth century. Its quaintness has subjected the author to the charge of affectation, but there is nothing really affected in his writings. His style is not so much an imitation, as a reflection, of the older writers; for in spirit he made himself their contemporary. A confirmed habit of studying them in preference to modern literature, had made their style natural to him; and long experience had rendered it not only easy and familiar, but habitual. It was not a masquerade dress he wore, but the costume which showed the man to most advantage. With thought and meaning, often profound, though clothed in simple language, every sentence of his essays is pregnant; and in this respect he bears a strong resemblance to the writers alluded to. If he had their manner, he possessed their spirit likewise. To some of his essays and specimens we are considerably indebted for the revival of the dramatic writers of the Shakspearian age; for he preceded Gifford and others in wiping the dust of ages from these admirable writers. In his brief comments on each specimen, he displays exquisite powers of discrimination. His discernment of the true meaning of the writer is almost infallible. He seizes with unerring precision the proper point of view from which the piece ought to be seen; and this led him with equal success to detail the real centre, whether a character or an event, round which the orb of the drama revolved. His penetrating intellect enabled him to throw more and newer light on the true meaning of some of the great masterpieces of the theatre than any other man. The perfect unison of the style of his annotations with the text which they illustrate, also constitutes a great charm, if not a leading merit. As a poet, Mr Lamb is not entitled to a very high place. Like his prose works, his poetical pieces are written in an antique style, so completely identical with that of Beaumont and Fletcher, Johnson, and others of that era, that they might pass current for genuine specimens of these great writers. In private life Mr Lamb was extremely amiable, and his house was a great resort for wits and men of letters; for, in wit and shrewdness of observation, his conversation was considered as equal to his writings.

LAMBALLE, a city of France, in the department of the Northern Coast, and arrondissement of St Brieux. It stands on the river Gnoseion, on one of the most fertile spots of the district, and contains 3900 inhabitants, who make linen goods, leather, but especially the best parchment. Long. 2. 41. W. Lat. 48. 28. N.

Lambecius.

LAMBECIUS, or Lambeck, Peter, one of the first bibliographers of Germany, was born at Hamburg, on the 13th of April 1628. He was the son of Heino Lambeck, a good arithmetician, who published several works, and of a sister of Lucas Holstein, called in Latin Holstenius. After he had completed his early studies, his uncle counselled him to visit the most celebrated schools, and generously undertook to bear the expense of his travels. He set out from Hamburg at the close of the year 1645, and stopped some time at Amsterdam, where he attended the prelections of Vossius and of Baerle, to whom his uncle had recommended him. He then visited Leyden, and other principal cities in the Low Countries; after which he proceeded to Paris, where he resided a year with Cardinal Barberini, who, out of consideration for Holstenius, showed him every attention, and introduced him to many of the most learned men of the time. At length, in 1647, he rejoined his uncle at Rome. Holstenius received him in the kindest manner; but he soon had occasion to appreciate the character of his nephew, which exhibited a singular mixture of pride and baseness, and, at the end of two years, they separated in mutual dislike. Lambecius quitted Rome in 1649, studied law for a short period at Toulouse, and then revisited Paris, where he occupied himself in collecting materials for his history of Hamburg, to which place he returned in 1651. Some time after his return to his own country, he was appointed professor of history in the college of Hamburg, and commenced his prelections by a discourse *De Historiarum cum cæteris Studiis conjunctione*, which confirmed the favourable opinion that had been formed of his talents. In 1659, he succeeded Joachim Jungius in the rectorship, and, by his zeal for the prosperity of the school, proved himself worthy of this promotion. But his religious principles began to be suspected; and as it seems certain that, during his travels, he had secretly abjured Lutheranism, he became exposed to every species of annoyance in consequence. Sensible that he could not preserve his situation, and desirous to make some provision for the future, he married an old maid whom he believed to be wealthy; but finding himself deceived, he fled from Hamburg, fifteen days after this ridiculous marriage, with the resolution never again to return thither. He took his departure upon the 14th of April 1662, and proceeded to Vienna, where he met with a flattering reception from the Emperor Leopold, to whom he had the honour of presenting his first work, being the *Prodromus Historiæ Literariæ*. In May he left Vienna for Italy, and, on reaching Venice, sent to the senate of Hamburg a formal resignation of his appointments as rector and professor. On his arrival at Rome, he introduced himself to Christina, queen of Sweden, who kindly endeavoured to console him for the persecutions he had experienced at the hands of the Protestant theologians. He there also solemnly abjured the errors in which he had been educated, and returned to Vienna, which he reached in the month of September. The emperor immediately conferred on him the title of historiographer, with the situation of sub-librarian; and some months afterwards, on the demise of Mathias Manchter, he became principal keeper of the imperial library. He immediately set about arranging in the best order the vast collection confided to his care; he removed the manuscripts from an obscure corner, where they had been abandoned to neglect and decay, classed them, and commenced a catalogue of this part of the collection. He made two journeys, one to Innspruck, and another to Baden, whence he brought back a large quantity of rare books and manuscripts, with which he enriched the imperial library, to which his own was afterwards added. Lambecius, being naturally frugal, lodged with an advocate named Strellmayer, who managed all his affairs, and whom, in return, he made his heir. He died at Vienna in the month of April 1680, at the very time when he was preparing to prosecute his labours with the greatest vigour. His works are, 1. Prodromus Lucubrationum criticarum in A. Gellii Noctes Atticas, Paris, 1647, in 8vo; 2. Animadversiones ad Codini Origines Constantinopolitanas, Paris, 1655, in folio; 3. Origines Hamburgenses, sive rerum Hamburgensium libri duo, Hamburg, 1652–1661, in two vols. 4to; 4. Prodromus Historiæ Literariæ, ibid. 1659, in folio; 5. a Collection of Discourses pronounced in the Gymnasium of Hamburg; 6. Commentarii de Augustissima Bibliotheca Cæsarea Vindobonensi, Vienna, 1665–1679, in eight vols. folio. Bayle has devoted to Lambecius an article in his Dictionary, and Niceron has inserted the life of this bibliographer in his *Mémoires*. (A.)

LAMBERT of Aschaffenburg, a Benedictine monk, of the eleventh century, who wrote several works, amongst which is a History of Germany from the year 1050 to 1077.

LAMBERT, JOHN, was born on the 7th September 1619, in the parish of Kirkby-Malhamdale, in the west riding of Yorkshire, at Calton Hall, the seat of a family of which he was the representative, and which traced its descent from a daughter of the Conqueror. That his father died when he was thirteen years of age, that he married, when in his twenty-first year, a daughter of Sir William Lister, his neighbour, and that he studied the law in an inn of court, but never pursued it as a profession, is all that we find recorded of his early years. He first participated in political measures, as one of those who signed the address to the king, of the 13th of May 1642, in answer to his demand of a guard of horse from the county of York. He also signed a declaration and protest against raising troops and money, in preparation for the ominous struggle which was then commencing. He also attended the great meeting on Heworth Moor, on the 3d of June, when a petition was presented by Sir Thomas Fairfax, which Charles refused to accept. In August the royal standard was raised, and the civil war was begun; and, in September, Lambert commenced his military career as captain in the parliamentary forces, under Lord Fairfax, who commanded them in the north. In the following year we find him bearing the rank of colonel: and the earliest exploits in which he is known to have distinguished himself, were a sally from Hull on the 11th of October 1642, by which he obliged Lord Newcastle to raise the siege; an engagement at Bradford on the 5th of March 1644, wherein he defeated Colonel Bellasis; and the pursuit of this officer and his troops to Selby, which, being joined by Lord Fairfax, he stormed and took on the 11th of April. The siege of York by the combined forces of Lords Fairfax, Manchester, and Leven ensued; and, on the 2d of July, the eventful fight of Marston Moor. Here Lambert and Sir Thomas Fairfax were the two officers by whom the right wing of the parliamentary forces, consisting of cavalry, was commanded. Opposed to it was the cavalry commanded by Prince Rupert, which Lambert and Fairfax charged and broke; but were carried too far by the ardour of pursuit. Lambert appears to have shown much bravery in this action, but others were more instrumental in its important issue. The siege of York was recommenced by the victorious army, and Lambert was sent in to a parley with the governor, which ended in the surrender of that city. Upon the resignation of Lord Essex in January 1645, and the appointment of Fairfax to succeed him as commander-in-chief of the parliamentary forces, Lambert was appointed commissary-general of the northern army, and ordered to take charge of the forces in Yorkshire in the absence of Fairfax. Under Lambert's command, during 1645, the royalists were beaten in two skirmishes, at Keighley and Ferrybridge; and the garrisons of Scarborough, Pomfret, Sandall, Sherborne, Bolton, and Skipton, surrendered to the parliament. In the commencement of 1646 we find Lambert engaged under Fairfax in the west, in subduing the last remnants of the royalist forces in that quarter: we find him at the sieges of Dartmouth, of Truro, and of Exeter, which surrendered, the first on the 20th of January, the second on the 14th of March, and the last on the 9th of April; after which he marched with the army to the siege of Oxford, and was one of the commissioners who conducted the negotiation which ended in the surrender of that important city, of which, by the parliament, he was appointed governor. He was afterwards made one of a select council of five (his colleagues being Cromwell, Ireton, Fleetwood, and Whitelocke), to consult on the disposal of the parliamentary forces for the reduction of the few garrisons which still maintained the authority of the king. These were the principal military services which Lambert is recorded to have rendered to his party during the first civil war. In the struggles for ascendancy between the parliament and the army in 1647, Lambert took a prominent part, and was an able advocate of the cause of the latter. In the declarations published on the part of the army, "Colonel Ireton," says Whitelocke, "was chiefly employed, or took upon him the business of the pen; and having been bred in the Middle Temple, and learned some grounds of the law of England, and being of a working and laborious brain and fancy, he set himself much upon these businesses, and was therein encouraged and assisted by Lieutenant-General Cromwell, his father-in-law, and by Colonel Lambert, who had likewise studied in the Inns of Court, and was of a subtle and working brain." He was one of the commissioners who, on the 2d of July, attended at High Wycombe, to treat with commissioners from the parliament, and prepared the proposals for the settlement of the kingdom, which they submitted to the parliamentary commissioners at Colnbrooke, on the 3d of August; proposals which insisted neither on the abolition of episcopacy nor the punishment of the royalists, and which contained terms more favourable to regal power than those to which Charles afterwards acceded in the Isle of Wight.

After delivery of these proposals, Lambert was sent into Yorkshire as major-general of the four northern counties. In 1648 the civil war again broke out, and his military talents were again exerted. He defeated Langdale and Musgrave near Carlisle, whilst awaiting a junction with the Scotch army under the Duke of Hamilton, which was about to invade England. The junction, however, could not be prevented; and Lambert, much inferior in strength to the combined armies, was obliged to await the arrival of Cromwell before he hazarded an action. When reinforced by Cromwell in August, the parliamentary forces were scarcely more than 8000 men, whilst those of Hamilton and Langdale were 20,000. But availing themselves of the detached position of the allied forces, the parliamentary generals attacked them successively, and put each army utterly to rout; and Hamilton, who with the remnant of his forces fled towards the south, was pursued by Lambert and his cavalry to Uttoxeter in Staffordshire, where, having in his progress dispersed and beaten the scattered portion of the Scotch army, Lambert forced its commander to surrender. He then followed Cromwell into Scotland, where they were received cordially by Argyll's party; and Lambert, after remaining awhile at Edinburgh at Argyll's request when Cromwell had returned, and having received thanks for his good services from the committee of estates, marched back into England to reduce Pomfret, a strong fortress which the royalists had seized anew. Before this place he arrived in December 1648, and here he remained till after the trial and execution of Charles; events in which he bore no part, and of which we have no evidence of his having approved. Pomfret surrendered soon afterwards; and the parliament, on receiving this intelligence in March 1649, voted thanks to him, and a grant of lands out of the demesnes of Pomfret, of the value of L.300 a year, "in respect of his many great and eminent services, performed with much care, courage, and fidelity, as well against the Scots army as against the forces of Sir Marmaduke Langdale, and in reducing the castle of Pomfret, being the last garrison in England held out against the parliament, and in respect of his extraordinary charges therein, he having not been allowed any pay as a major-general." When the parliament found it expedient to appoint some person to command in Ireland, Sir William Waller was supported by the Presbyterian party, and Lambert, whom Clarendon calls "the second man in the army" (Cromwell being the first) was preferred by the Independents. Both, however, waived their pretensions in favour of Cromwell, who was consequently appointed to the government of Ireland, and soon afterwards, upon the resignation of Fairfax, to the post of commander-in-chief of all the parliamentary forces. Lambert was at the same time made second in command; and the two generals, in June 1650, marched towards Scotland, where Charles II., who had been acknowledged in that portion of his dominions, was at the head of a numerous force, hoping by its aid to subdue the remainder. Lambert, in a gallant but indecisive action near Musselburgh, was wounded, his horse killed, and himself for a while in the hands of the enemy, but was rescued by his troops. Nothing decisive occurred till the memorable battle of Dunbar, in which Lambert led the van, and eminently contributed to the successful issue of that important action; which was followed by the occupation of Edinburgh and Leith, and the surrender of the castle of Edinburgh in the course of the winter. No further advantage was obtained till the summer of 1651, when, in the month of July, Lambert defeated above 4000 of the king's troops at North Ferry, and obtained minor successes in the course of the same month at Inchgarvey and Burntisland. The parliamentary generals had not been careful to keep between the king and the English frontier; and, profiting by their oversight, Charles, immediately after these actions, embraced the bold resolution of marching into England, and passed through Carlisle on the 5th of August, at the head of 16,000 men. Leaving Monk before Stirling with 7000 men to reduce that fortress, Cromwell and Lambert hastened in pursuit of Charles; and it was the duty peculiarly assigned to Lambert to hover with his cavalry round the royalist army, and harass and divert its progress, whilst Cromwell pursued a more direct route southward, in order to interpose between the king's army and the capital. Lambert, though with a far inferior force, engaged the royal army at Warrington; but the country, being much enclosed, was unfavourable for his cavalry, and he retired to Knutsford Heath, where he could act with more effect. The king, however, rightly judging that it was Lambert's policy to disturb the march of the royalist forces, was unwilling to attack him, and passed on towards Worcester. Lambert, instead of pursuing him further, attended Cromwell's summons for a general rendezvous of the parliamentary forces at Warwick. From thence the combined forces, amounting to about 30,000 men, marched to Worcester, where, on the 3d of September, the anniversary of the battle of Dunbar, occurred that important conflict which reduced Charles from the leader of a mighty host to the condition of a proscribed, disguised, and solitary fugitive. Lambert behaved with skill and gallantry in this battle, in which he was much exposed, and had his horse shot under him. He bore as large a share of the honours of success as could fairly be ascribed to a second in command, where Cromwell was the chief; and the gratitude of the parliament was promptly shown, on the sixth day after the battle, by a resolution "that lands of inheritance in Scotland, to the yearly value of L.1000 sterling, be settled upon Major-general Lambert and his heirs, for his great and eminent services for this commonwealth;" and it was ordered that both of his regiments should continue on the English establishment. In the winter of this year, Lambert was made a commissioner, together with Monk, Vane, St John, and four others, for the settlement of affairs in Scotland, where he remained a very short time, being, on the death of Ireton, appointed by the parliament, in January 1652, to succeed him as lord-deputy of Ireland. But the term of this office was limited to six months, and Lambert, filled with displeasure against the parliament (a displeasure which Cromwell artfully fomented), resigned the proffered post; upon which Fleetwood, who had married Ireton's widow, the daughter of Cromwell, was appointed in his stead. Lambert appears to have been amongst those who were most favourable to the assumption of supreme power by Cromwell, and whose influence chiefly contributed to elevate him to the situation of protector. He was the leading person in a general council of officers convened to deliberate on the settlement of the kingdom; he was one of a select committee deputed by that council to prepare the ground and conditions of a plan; he participated in framing the *instrument of government*, presented it to the council, and urged its acceptance; and he bore a prominent part in the installation of Cromwell as lord-protector. As president of the council, he came forward to declare the dissolution of the parliament (called Barebone's), and the adoption of the plan of government prepared by the council; and invited Cromwell to undertake the office of chief magistrate under this constitution; upon which Cromwell, "having heard the instrument of government read, and taken the oath as directed in the close of the said instrument, Major-general Lambert, kneeling, presented him with a sword in the scabbard, representing the civil sword, which Cromwell accepting, put off his own, intimating thereby that he would no longer rule by the military sword."

Lambert sat as member for the west-riding of Yorkshire in the new parliament, which met on the 3d of September 1654. He appears to have been an active member of the legislature, being named on almost all committees, and frequently a teller in divisions; but his share in debate is not recorded, except on one important occasion, where he acted in a manner which appears unquestionably disinterested. It was debated in a committee of the whole house, on the act of settlement, whether the office of protector should be *hereditary* or *elective;* and Lambert, on whom, after Cromwell's death, the office would be most likely to fall, spoke strongly in favour of its being made hereditary.

In the parliament which was convened in 1656, Lambert was again member for the west-riding of Yorkshire, and exerted himself to maintain that form of government, in the constitution of which he had been principally concerned. He vehemently opposed the proposal of investing Cromwell with the title of king; and though the offer of that title was carried in the obsequious parliament, the opposition of Lambert, and the murmurs of the army, with which he had much influence, made Cromwell feel that it was prudent to decline it. He had at one time resolved to accept the title; upon learning which, Lambert, Fleetwood, and Desborough, declared to him, in their own names and those of others, that in that event they must resign their commissions, and sever themselves from his councils and service for ever. Cromwell consequently refused the title, but accepted all those other attributes of royalty with which he was invested, on his second inauguration, of the 12th of May 1657. Lambert, disgusted with these inordinate assumptions of power, refused to take the oath of fidelity to the protector; gave up his commissions, which brought him an income of six thousand pounds per annum; and retired on a pension of L.2000. Lambert took no prominent part in political events until after the death of Cromwell, the succession of Richard, and the meeting of a new parliament in January 1659, in which Lambert was elected for Aldborough and Pomfret, and took his seat for the latter.

He was one of an opposition characterized as "republicans," amongst whom were Vane, Hazlerig, Ludlow, and Fairfax; a body small in number, but formidable from their ability, activity, and union. The first important measure debated was the bill of recognition for establishing Richard in his office, in which, though the protectorists succeeded, Lambert's party obtained a resolution, that, previous to its commitment, "the house should declare such additional clauses to be part of it, as should bind the power of the chief magistrate, and fully secure the rights and privileges of parliament, and the liberties and rights of the people." The acknowledgment of the House of Lords as constituted by Oliver was next debated, and warmly opposed by Lambert and his party, who, though unable to succeed, in consequence of the union in this instance of the protector's friends with the concealed royalists, rendered the recognition much less full than had been contended for by the court party. Meanwhile, Lambert, with Fleetwood and other leaders of the army, had begun to meet at Fleetwood's residence, Wallingford House, where they held council how to subvert Richard, and to uphold what they called "the good old cause." A struggle ensued between the army and the parliament now become Richard's sole support. The Commons, on the 18th of April, carried a resolution that there shall be no council of officers during the sitting of parliament, without permission of the protector and of the houses; and, on the 21st of that month, the command of the army was vested in the three estates, to be exercised by the protector. This brought the struggle to a crisis. Richard was peremptorily told by Desborough that the parliament must be dissolved; and he accordingly dissolved it on the following day. From this time Richard's power had departed, and the country for a while was without a government. The army was the predominant power, and Lambert was its real leader; for Fleetwood, the nominal commander-in-chief, was too vacillating for such emergencies. But the army leaders felt that it was dangerous to attempt to govern without some semblance of civil administration; so the members of the long parliament, excluded by Cromwell in 1653, were invited to assemble; and this remnant, ridiculed under the name of "the Rump," met as a parliament on the 7th of May. Order was for a while restored; but the royalists were encouraged, by the state of the country, to make a bold effort for the restoration of Charles; and Lambert's military prowess was again required in August for the suppression of a rising in Cheshire under the command of Sir George Booth. Lambert obtained a complete and easy victory at Nantwich, in reward for which service the parliament voted him L.1000. But the parliament feared Lambert's power and probable ambition, his influence in the army, and the control of his more powerful mind over the wavering Fleetwood; and, on a petition having been presented from the army in his favour, the effect of which would have been to give to Fleetwood the nominal command, and to Lambert the real power (as was formerly the case under Fairfax and Cromwell), Hazlerig, suspecting Lambert to be the instigator, rashly moved that he should be sent to the Tower. This motion, and the votes hostile to the power of the army, produced a breach, which Hazlerig rashly made irreparable, by attempting to deprive Fleetwood, Lambert, and other leaders of the army, of their commissions. Upon this, Lambert, with Cromwell's example before his eyes, dissolved the parliament by military force; and the supreme authority again devolved on the military council at Wallingford House. The people murmured at their sway; and Monk commenced his celebrated march from Scotland, with the professed intention of restoring the power of the parliament. Lambert, with a view to subdue or win this formidable opponent, proceeded northward, at the head of 7000 men, having previously exacted a promise from Fleetwood that he would not, without his concurrence, make any terms with Charles II. or with Hazlerig. But when arrived at Newcastle, Lambert allowed himself to be overreached by the subtlety of Monk, who amused him with negotiations, of which the real object was delay, whilst Monk was strengthening his force by recruiting in the north, and events were favouring his views in the south. There the power of the military council was crumbling away in the absence of Lambert, and under the feeble administration of Fleetwood, who resigned his commission on the 26th of December. The ejected members resumed their authority; and one of their first acts was to disband Lambert's forces, and order him to return to his own house. Desertion had thinned his ranks; to resist was useless; he obeyed, and being thought too dangerous and powerful to remain at liberty, was soon afterwards committed to the Tower. In April, when Monk had almost withdrawn the mask, and appeared the restorer rather of monarchy than of that "good old cause," as it was termed, to which many had believed him friendly, the republicans again turned their eyes towards Lambert. Apprized of their wishes, he escaped from the Tower, and after lying hid a short time in the city, he hastened into Warwickshire, where, on the 13th of April, he placed himself at the head of six troops of horse and several companies of foot. He was opposed near Daventry, on the 21st, by an equal force, under the command of Ingoldsby. His soldiers refused to fight; and, without a blow being struck, Lambert, the idol of the army, was compelled to surrender, and was again committed to prison.

After the restoration of Charles II. Lambert, though not a regicide, was excepted out of the bill of indemnity. But the Lords and Commons of the convention parliament concurred in a petition, that if he shall be attainted, execution as to his life might be remitted; to which petition the king assented. The succeeding parliament, less mercifully disposed, pressed urgently that he and Vane should be brought to trial, which was accordingly done on the 4th of June 1662, when Lambert was arraigned in the Court of King's Bench, for levying war against the king. His demeanour was meek, and is represented by some as having been deficient in manliness. But an absence of useless bravado is surely an insufficient ground for attributing cowardice to one whose whole previous career had incontestably proved his courage. Lambert was found guilty, and received judgment of death; but his punishment was commuted to imprisonment for life in the island of Guernsey. There he seems to have been mildly treated. It appears, from the warrant-book in the State-paper office, that in November 1662 a warrant was issued to the governor of Guernsey for permitting Lambert to have the liberty of the whole island. That this was afterwards withdrawn (though at what time and for what reason is not known), may be inferred from another warrant of March 12, 1664, directing that Lambert should have his *former* liberty. A letter, hitherto unpublished, is extant in the Bodleian Library; it is from Lambert to the Chancellor Clarendon, dated 27th April, and probably in the year 1664, from which it appears that he owed this favourable treatment to the good offices of that minister. The following extracts, whilst they declare this fact, also display the grateful and contented spirit of the writer:—"Here, my Lorde, give me leave (seeing I believe it cannot be unwelcome to you to know the happie effects of what yo^{r} Lo^{pp} has beene so industrious to procure) to acquaint yo^{r} Lo^{pp} that my L^{d} Hatton (since his arrival here) has beene pleased to give a great alaye to my affections, by assuring mee that I still live under those gratious reflections his Ma^{tie} was once pleased to cast upon mee." "And here, my Lord, againe I beg y^{r} patience while I acquaint you that my Lord has not only poured this oyle into my bones, but has confirmed and improved it by a most frendly and candid deportment towards mee, so as his Maty's late orders of grace were dispensed to mee wth as liberal a hand as I can expect, so as in truth I find it rather difficult to finde what is fit to aske then to obtaine." Lambert remained in Guernsey till his death, which occurred about thirty years afterwards. The favourite pursuits of this tranquil remainder of his active life were botany and painting. It does not appear that he devoted any part of it to literature, or left any record of the great events in which he had been engaged.

Lambert's abilities as a military man were great. In this capacity he was second only to Cromwell, and was, next to him, the idol of the army. As a politician he was less eminent; and though greatly superior to the vacillating Fleetwood, he wanted that union of caution and boldness which enabled Cromwell to surmount all difficulties. That he failed to stem the tide of returning attachment to monarchy is not imputable as a proof of deficiency in political skill, since it may be questioned whether even Cromwell, had he lived, would have been able ultimately to counteract it. A want of caution was the fault which made him at length a victim to the subtlety of Monk. He appears to have been of a mild and amiable disposition, and to have exhibited more of refinement and a courteous bearing than was common amongst his associates. His ambition appears to have been not of an inordinate and reckless kind, but mingled with traits of generosity and disinterestedness. His career was unsullied with crimes against humanity. In troubled times he long held the second place of power, and for a short period the supreme authority, without being chargeable with any act which reflects discredit on his moral character. Though the last and most formidable opponent of the restoration, he seems to have been regarded by the royalists with a degree of good will which was not extended to his inferior associates. He was not one of those master-minds which seem to direct the course of events. He belongs to that secondary class, who display ability in execution rather than in direction. Amongst such, Lambert is entitled to a high place; and he may ever be considered as a very able, and in some respects an estimable man.

(See Whittaker's *History of Craven;* May's *History of the Parliament;* Whitelock's *Memorials;* Ludlow's *Memoirs;* Clarendon's *History of the Rebellion, and Life of himself;* Rushworth's *Collections; State Trials.*) (Y. Y.)

LAMBERT, *John Henry*, a natural and moral philosopher of great talent and originality, born on the 29th of August 1728, at Mülhausen, in Upper Alsace, was the son of a French refugee in a very humble station, and one of a numerous family.

His early studies were only assisted by the instruction he obtained at a small free school in his native town. His father, who was a tailor, could scarcely even afford him leisure from mechanical labour. He was obliged to read and write in the night; and, in order to procure candles, he made little drawings for sale, while he was watching the cradle of his infant sisters. Having learned to write a good hand, he obtained some employment as a copying clerk in the chancery of the town, which he gave up when he was only fifteen, upon being appointed book-keeper at some iron-works in the neighbourhood. At seventeen he became secretary to a Doctor Iselin, who was the editor of a newspaper at Bâle, and who became his firm friend through life. He had now time to render himself familiar with the works of Wolf, Locke, and Malebranche, to which he was in a great measure indebted for the correct logical method that he ever afterwards followed in his researches; having, however, confirmed and improved it by the study of the mathematics, to which he devoted himself with great zeal, and which, after all, constitutes the best practical school of genuine logic.

In 1748, he removed to Coire, having been recommended by Iselin, as private tutor to the family of the president, Count Peter de Salis, whom he undertook to instruct in history and religion, as well as in languages and science. The library of his patron was extensive; he profited by it in all its departments; and his residence at the house of an accomplished statesman, frequented as it was by the best-informed persons of different countries, and with different pursuits, could not but greatly contribute to the extension of his knowledge, and the improvement of his taste. He even amused himself with some poetical exercises in various languages, which must, at least, have been of advantage to his style in prose. He felt the importance of his literary and scientific pursuits to himself and to the world; and in 1752 he determined to keep a journal of all his studies, which he continued throughout his life. He began to publish a variety of fugitive pieces, on different subjects, in the newspapers and in other periodical works of the day, some of which attracted the notice of his learned countrymen; and, in 1754, he was made a member of the Physico-medical Society, then lately established at Bâle, to the Transactions of which he contributed many interesting papers. In 1756 he went to Göttingen with two of his pupils, and in 1757 to Utrecht. The next year the party returned to Coire, by way of Paris, Marseilles, and Turin. At Paris he paid a visit to D'Alembert, who does not appear at that time to have appreciated his merit very highly, though he afterwards rendered him some services with the king of Prussia; but he became more intimately acquainted with Messier the astronomer.

In 1759 he quitted the family of the Count de Salis, and went to settle at Augsburg, having a small salary as a member of the Electoral Academy of Bavaria. From 1761 to 1763 he was again at Coire and in its neighbourhood, being employed in fixing the boundaries between the country of the Grisons and the Milanese territory. Towards the end of 1763, having had some disputes with the Bavarian academicians, he went to Leipzig, and the next year to Berlin, where he was made a member of the Royal Academy of Sciences, and where he continued to reside during the remainder of his life, receiving many marks of favour from the discriminating liberality of Frederic: thus, in the year 1770, he was made superior counsellor of the board of works, with an additional salary. He contributed a number of valuable memoirs to the collection of the academy; and in 1774 he undertook the direction of the *Astronomical Almanac*, for which he was admirably qualified. He was also a constant writer in the journal published by Nicolai, under the title of the *Universal German Library;* and he kept up a very extensive correspondence on various subjects of literature and science.

He was regularly in the habit of writing or reading from five in the morning till twelve, and again from two till midnight; a degree of application unquestionably far beyond that which would have been best calculated for producing the maximum of valuable effect. Perhaps, if he was paid for writing by the ream, he may have earned as much from the booksellers as he would have done by a more judicious economy of his powers; but a nervous system, attenuated by the daily study of seventeen hours, could never have been capable of being employed in any very elevated flights of genius, or in the invention of any sublime or exquisite novelties either in science or in literature; and it is only wonderful that he did any thing so well, as almost to form an exception to this general remark. He was indeed supposed to have injured his health by continued application, and he died consumptive, on the 25th September 1777, at the age of forty-nine. He had never been married. His person was of the middle size, with an interesting and expressive countenance; he was ambert, ohn Henry.

animated and lively in conversation, and liked discussion, but not disputation. He had no literary quarrels; and his criticisms were not offensive, even when they ceased to be flattering. His morals were strictly correct, but his manners were not altogether in unison with those of the society to which his talents had elevated him. He is said to have been timid, awkward, slovenly, and fond of low company; but upright, patient, unostentatious, and compassionate; essentially modest, but as ready to assert his own merits as to admit his defects. He had a happy facility in managing the instruments of computation, especially in the arrangement of converging series; and he had a peculiar talent for expressing the results of observation by an analytical formula, having first thrown them into the form of a geometrical diagram to assist his invention; a process which he employed with regard to the probabilities of life in London, and to the inequalities of Jupiter and Saturn. In short, after Euler, Lagrange, D'Alembert, and Daniel Bernoulli, there are few mathematicians and natural philosophers of any age who can be put in competition with him, and still fewer who benefited the public by so many diversified labours.

It would be hopeless to attempt to pursue his indefatigable pen through all its wanderings; and a complete catalogue of his works would be as useless as it is unattainable. A man who wrote so incessantly must have written many things which were destined to oblivion from their first production. It will be sufficient to mention the most remarkable of his works, without any very strict regard to the priority of their publication.

1. In the *Acta Helvetica of the Society of Bâle*, ii. 1752, we find an Essay on the Force and Measurement of Heat, a subject which the author resumed in the latter part of his life. 2. A General Series, somewhat resembling Taylor's, *Act. Hel.* iii. 1758. 3. Meteorological Observations, *ibid.* 4. He also published a paper on the Vibration of Chords, in the same collection.

5. Les Propriétés les plus Remarquables de la Route de la Lumière par les Airs, et en général par plusieurs milieux Refringents, Hague, 1759, in 8vo; German by Templehof, Berl. 1773. This work does credit to the ingenuity and mathematical abilities of the author, though its results may be obtained in a simpler manner by some methods more recently invented.

6. La Perspective Libre, Zurich, 1759, 8vo; another edition in German. The second German edition, 2 vols. 8vo, Zurich, 1773, contains some additional matter, especially a system of geometry, depending, as it is said, upon the ruler alone, without any other instrument. Such a system must, however, have been extremely limited in its application, much more so than Mascheroni's *Geometria del Compasso*.

7. Photometria, sive de Mensura et Gradibus Luminis Colorum et Umbræ, Augsb. 1760, 8vo. This original and interesting volume includes and supersedes the greater part of Bouguer's experimental determinations. It contains the important discovery, that a luminous surface emits its light with equal intensity in all directions; together with some improvements in the theory of twilight, and an investigation of the comparative light of the sun and moon, and stars and planets.

8. Insigniores Orbitæ Cometarum Proprietates, Augsb. 1761, 8vo. We here find the elegant theorem for expressing the relation of the area of a sector to the sides of the triangle inscribed in it. This theorem had been demonstrated with respect to the parabola by Euler in 1740; but Lambert first extended it to the other conic sections, and he certainly re-invented the whole, without being aware of what Euler had done. It may be found, together with a concise demonstration, and a further account of this work, in the translation of Olber's *Essay on Comets*, published in the *Journal of the Royal Institution*.

Lambert, John Henry.

9. Cosmologische Briefe, Augsb. 1761, 8vo. A French translation of these Letters on the Universe appeared in the *Journal Helvétique of Neuchâtel*, 1763-4; an extract was published by Merian, with the title of *Système du Monde*, Bouillon, 1770, Berlin, 1784, in 8vo; and a translation by Darquier appeared at Amsterdam, 1801, in 8vo. The whole work is written in a popular style, and adapted to the taste of general readers. The author's favourite idea was to make the sun a sort of planet, revolving round some other great body; and he supports the opinion by an argument derived from the supposed insufficiency of the laws of gravity, as relating to the solar system, for explaining some of the inequalities of the motions of Jupiter and Saturn, which have, however, since been reduced to the general analogy by Lagrange and Laplace.

10. Zusätze zum Traité de Nivellement Von Picard, 12th August 1761, explaining some improvements on Picard's level, executed by Brander, an ingenious artist, whom Lambert also assisted in the improvement of Gunter's sliding rule. 11. He published an explanation of this scale, entitled Logarithmische Rechenstäbe, 12th August 1761.

12. Remarks on Incommensurable Quantities, *Mém. Ac. Berl.* 1761. A demonstration of the incommensurability of the circumference of a circle to its diameter, which has been adopted by Legendre in his Geometry. It depends on the method of reducing a fraction to its lowest terms, as laid down by Euclid, and on the properties of continual fractions; an expression is obtained for a tangent in terms of the arc from the quotient of the series for the sine and cosine, and the continual fraction thus obtained is proved to be infinite. It is also shown that the ratio of the arc to its tangent can never be expressed by any finite quadratic surds. 13. On the Specific Gravity of Salt, and of its Solutions, *M. Berl.* 1762.

14. Novum Organum, Leipzig, 1763, in German, two vols. 8vo. An attempt to restore and improve the Aristotelian method of syllogism, in which the author is allowed to have displayed much ingenuity, though its success was greatly limited, on the one hand, by the sober good sense of the empirical reasoners of the school of Bacon and Locke, and, on the other, by the wild enthusiasm of the German innovators, who were beginning to be intoxicated with the high-sounding phrases and exaggerated pretensions of the disciples of Kant. A manuscript Latin translation of the work, by Pfleiderer, was once in the possession of the late Lord Stanhope.

15. A paper on Trigonometry appears in the *Nova Acta Eruditorum* for 1763. 16. In the *Berlin Memoirs* for the same year, we find an Essay on Acoustic Instruments, investigating the best forms for hearing trumpets. 17. Remarks on the Properties of Equations of all Degrees. 18. On Divisors of Equations, which may be found without solving them. 19. On some Measurements relating to the Intellectual World; that is, on probabilities and expectations.

20. Beyträge zur Mathematik, Berlin, 1765, 1770, 1772, in four vols. 8vo: a collection of essays on every department of mathematical science. The first volume contains Remarks on Trigonometry, and on the Certainty of Observations; on the Divisors of Numbers, and on Annuities: the second, Tables of the Moon; an Essay on Dialling, and on Geographical Projections, with the Elements of Tetragonometry, a subject which was afterwards resumed by the younger Mayer: in the third volume there is an Essay on Interpolation, Remarks on Celestial Maps, with other articles.

21. Description of a Table of Eclipses, Berl. 1765, with the easiest mode of computing them. 22. In the *Memoirs of the Academy of Berlin* for 1765, we have a paper on Projectiles, including the effect of resistance. 23. In those of the *Bavarian Academy* for the same year, some remarks

Lambert, John Henry.

on the Improvement of Terrestrial Measurements; and, 24. Meteorological Observations. 25. In the *Nov. Acta Erud.* for 1765, An Attempt to employ Calculation in the Moral Sciences. 26. On the Magnet, *Ac. Berl.* 1766. 27. Another paper on Magnetic Currents. 28. A Magnetic Chart was published separately the same year. 29. Remarks on the General Outline of the Ocean, *Ac. Berl.* 1767. 30. A General Solution of the Problem of Three Bodies by means of Series, *ibid.* 31. Notes on Richer's Philosophical Algebra, 1767.

32. Remarks on the Velocity of Sound, *M. Ac. Berl.* 1768; an unsuccessful attempt to reconcile the theory with observation. It was reserved for Laplace, by a single happy suggestion, to remove the whole difficulty. 33. On Photometry, as applied to Painting, *ibid.* 34. Trigonometrical Observations, *ibid.*

35. De Topicis Schediasma, 1768. 36. Remarks on the Divisors of Numbers, *Nov. Act. Erud.* 1769. 37. Anmerkungen über die Branderschen Micrometern, Augsb. 1769. Brander's micrometers were of glass.

38. Experiments on Hygrometry, *M. Acad. Berl.* 1769; relating to evaporation, and to the indications of hygrometers, especially those of catgut.

39. Supplementa Tabularum Logarithmicarum, 8vo, Berl. 1770; with a valuable introduction in German, on the abridgment of computations.

40. Anmerkungen über die kraft des Schiesspulvers, 8vo, Berl. 1770. In this investigation of the force of fired gunpowder, the author attacks several points in the theory of Robins, published a few years before.

41. Hygrométrie, 4to, Augsb. 1770.

42. On Directors for the Light of Lamps, *M. Acad. Berl.* 1770. 43. On Ink and Paper, *ibid.* 44. Analytical Observations, *ibid.;* relating to the general theorem resembling Taylor's, which was further discussed by Euler, and modified by Lagrange. 45. On Taxeometry, or the Measurement of Order, *ibid.;* considered as comparable in degree, and expressible by numbers.

46. Architectonik, 2 vols. 8vo, Riga, 1771; a logical and metaphysical treatise on the most simple bases of philosophical and mathematical knowledge, written in 1763. The last part, which relates to magnitude, is the most approved; but the whole work was never much read, being partly superseded by the more ostentatious novelties of the day.

47. In the *Berlin Memoirs* for 1771, we find papers on Meteorology. 48. On the Atmospheric Influence of the Moon. 49. On Achromatic Telescopes of one kind of Glass only. 50. On the Apparent Paths of Comets. 51. On the Grounds of Superstitious Belief, as compared with Probability.

52. Ueber das Farbenpyramide, 8vo, Berl. 1772; a description of a pyramid of wax, intended for the illustration of all the possible varieties of combination of the primitive colours.

53. Astronomisches Jahrbuch, Berl. 1774–9, in 8vo; an accurate and extensive ephemeris, with many original communications annexed to it.

54. In the *M. A. Berl.* 1772, a paper on Friction; supposed to follow the law of the resistance of fluids, with some remarks on that resistance. The opinion of the uniformity of the force of friction, which was even at that time general, was somewhat too hastily rejected by the author; but his computations may still be of use in some cases. 55. On the Fluidity of Sand; as resisting motion. 56. On Hygrometry; continued. 57. On the Density of the Air, with respect to sound and to refraction.

58. *M. A. Berl.* 1773: A Balistic Scale; for determining the paths of projectiles in the atmosphere. 59. Physical Observations, relating to Meteorology and to Optics. 60. On the Satellite of Venus; affording a remarkable instance of misapplied labour and ingenuity. 61. A Second Essay on Taxeometry. 62. A Note on the Inequalities of Jupiter and Saturn; intended to confirm the principles advanced in the Cosmological Letters. The detail was reserved for a subsequent volume.

63. *M. A. Berl.* 1774: On the Temperament of Musical Instruments. 64. On Aerial Perspective. 65. Report on a Bedstead for Sick Persons.

66. *M. A. Berl.* 1775: On the Elasticity of the Air. 67. On Windmills, and on the Force of the Wind. 68. On the Sounds of Flutes; an elaborate comparison of the various tones of a flute, with the theory of Daniel Bernoulli for determining the sounds of compound organ-pipes.

69. *M. A. Berl.* 1776: On the Strength of Men employed in Labour. 70. On Imperfect Fluids.

71. *M. A. Berl.* 1777: On the Elasticity of the Air.

72. *M. A. Berl.* 1779: Two Memoirs on the Inequalities of Jupiter and Saturn.

73. Pyrometrie, 4to, Berl. 1779; a posthumous work, upon a subject which had long occupied the author's attention; with a Preface by Karsten, and a Biographical Memoir by Eberhard.

74. A Paper on Annuities, *Leipz. Magaz.* 1780.

75. Deutscher Gelehrter Briefwechsel, Berl. 1781–7, in five vols. 8vo; published by John Bernoulli, and consisting principally of the author's correspondence with Holland, Kant, Karsten, Segner, Basedow, Scheibel, and Brander. The contents are more fully described by Lalande. *Bibl. Astr.* p. 584.

76. *M. A. Berl.* 1783: On Friction.

77. Logische und Philosophische Abhandlungen, Berl. 1787, in two vols. 8vo. Edited by J. Bernoulli.

78. On the Theory of Parallel Lines, *Hinderb. Arch. der Math.* i.

(Bernoulli in *Nouvelles Littéraires*, 8vo, Berl. 1777: Eberhard in *Pyrometrie Briefwechsel*, iii. *Phil. Mag.* May 1804; Aikin's *General Biography*, vi. 4to, Lond. 1807; Servois in *Biographie Universelle*, xxiii. 8vo, Par. 1819.) (L. L.)

Lambeth.

LAMBETH, a very large parish in the hundred of Brixton, in the county of Surrey. It may be considered as one of the suburbs of London, on the south side of the Thames, and only separated from it by that river. Its boundaries are very wide, extending on the east from Southwark, to Wandsworth on the west, and till it comes, at Norwood, in contact with Croyden to the south. It is remarkable for the palace of the Archbishop of Canterbury, an ancient and magnificent pile of building, of the architecture of various ages, from the year 1197 down to the present time, when it has been recently repaired and beautified by the taste and the munificence of the present occupier of that high ecclesiastical dignity. The library contains a most curious and valuable collection of books and manuscripts, calculated to throw much light on the ecclesiastical and civil history of the kingdom, as well as on the pedigrees of many illustrious families. The buildings, park, and gardens, are said to contain thirteen acres. The parish church is near the palace, and is a small old building; but new churches of appropriate size have been built under the recent act for building churches in different parts of the parish, which, though not quite adequate to the population, afford tolerable accommodation to the worshippers. The parish contains several large establishments of a benevolent kind, especially the new bedlam for insane persons, the philanthropic institution, and the asylum for female orphans, and the Westminster lying-in hospital. From its easy access to London, which three of the bridges over the Thames afford, many valuable manufacturing and commercial establishments are within the parish. Boat-building is one that gives employment to numerous persons. Iron-founderies, and especially shops for making steam-engines of all powers, are extensive branches of trade. Breweries and distilleries are among the list of its means of industry, and especially establishments for making vinegar and British wines. The celebrated gardens of Vauxhall are within this parish, and have been of late much improved in magnificence, as well as in the moral decorum, which was formerly a subject of regret and complaint. The parish is now divided into five districts, viz. St John's Waterloo, Kennington, Brixton, Norwood, and that which remains to the parish church. The annual value of the real property, according to the assessment of 1815, was L.220,618. Few parishes show a more rapid increase of population than this. The inhabitants amounted in 1801 to 27,939, in 1811 to 41,644, in 1821 to 57,638, and in 1831 to 87,856. Under the reform bill, Lambeth returns two members to the House of Commons.

LAMBIN, Denis, one of the most learned Frenchmen of the sixteenth century, was born at Montreuil-sur-Mer, in Picardy, about the year 1516. He studied at the College of Amiens, where he afterwards officiated for some years as professor of belles-lettres. He then accompanied Cardinal de Tournon to Rome, and profited by his stay in Italy to visit the principal cities, and to form friendly connections with the learned men of that country. On his return to Paris, he was appointed professor of eloquence in the Royal College, through the influence of Amyot and the Cardinals of Lorraine and of Tournon; and the following year he was promoted to the chair of Greek. He commenced his prelections by an excellent discourse, in which he traced out the course which he proposed to follow, and announced that he would explain alternately the Iliad and the Philippics, the two works best calculated to form poets and orators. The number of his auditors was considerable; but the contagious malady which then devastated Paris soon thinned his class, and also carried off a nephew to whom he was much attached, an event which drove him to seek, in a distant retreat, some alleviation of the grief which overwhelmed him. But his prelections were not long interrupted; and although already overburthened with labour, he consented, in the year 1570, to explain Cicero to some select pupils in the College of Lemoine. A witness of the civil troubles which then distracted France, Lambin bewailed them in secret; the massacre of the Protestants made a terrible impression on his mild and gentle spirit; and whilst the sorrow thus occasioned was recent and fresh, the news of the death of his friend Ramus arrived to complete his affliction. Unable to bear up under such an accumulation of calamities, he sunk the victim of grief, and died towards the end of September 1572, about a month after the tragedy of St Bartholomew. By his marriage with a lady of the house of the Ursins he left a son, who became preceptor to Arnauld and Andilly, and who also possessed much erudition. Lambin, though of a mild and modest character, had nevertheless his enemies. He was accused of appropriating the researches of his contemporaries without due acknowledgment; but there appears to be no foundation whatever for the charge. On the contrary, it was Lambin himself who had reason to complain of the plagiarisms of Muretus and his disciple Giphanius. He had also a warm dispute with Paulus Manutius on the orthography of the word *consumptus*, from which Lambin maintained that the letter *p* ought to be expunged; and it is even said that the disputants became so warm, that, in the course of this absurd controversy, they proceeded from mutual reproaches to blows. The style of Lambin is easy and pure, but diffuse and somewhat heavy; and his enemies characterised it by the word *Lambiner*, which has remained in the language. The works of this laborious scholar are, 1. Latin Translations of the Select Speeches of Æschines and Demosthenes, Paris, 1565, in 4to; of the Speeches of Demosthenes on the Crown, ibid. 1587, in 4to; and of the Morals and Politics of Aristotle, reprinted in the editions of that philosopher's works by Isaac Casaubon and Duval. 2. Editions of Lucretius De Rerum Natura, Paris, 1563, in 4to; of the Works of Cicero, Paris, 1566, in four vols. folio; of the Works of Demosthenes in Greek, Paris, 1570, in folio; of the Comedies of Plautus, Paris, 1576, in folio; and of Cornelius Nepos, ibid. 1569, in 4to. 3. Ciceronis Vita ex ejus Operibus collecta, Cologne, 1578, in 8vo. 4. Several very interesting Discourses, of which the reader will find some account in the Supplement to the Dictionary of Moreri, edition of 1749. 5. Prefaces and Epistles Dedicatory, collected, along with those of Muretus (Muret) and Regius (Leroi) in the *Trium Illustrium Virorum Præfationes*, Paris, 1679. 6. Letters in the different collections of the *Epistolæ Clarorum Virorum*. (See Tessier, *Eloges des Hommes Savants*; and Goujet, *Histoire du Collège Royal*.) (A.)

LAMECH, of the race of Cain, was the son of Methusael, and father of Jabal, Jubal, Tubal-Cain, and Naamah. Lamech is celebrated in Scripture for his polygamy. One day he said to his wives, "Hear me, ye wives of Lamech; I have slain a man to my wounding, and a young man to my hurt. If Cain shall be avenged seven fold, truly Lamech seventy and seven fold." These words contain an unintelligible riddle. The reader may consult the commentators. There is a tradition amongst the Hebrews, that Lamech, growing blind, ignorantly killed Cain, believing him to be some wild beast; and that afterwards he slew his own son Tubal-Cain, who had been the cause of this murder, because he had directed him to shoot at a certain place in the thickets where he had seen something stir. Several other suppositions are produced to explain this passage concerning Lamech, but all seem equally uncertain and absurd.

Lamech, the father of Noah. He lived an hundred fourscore and two years before the birth of Noah (Gen. v. 25, 31); and after that he lived five hundred and ninety-five years longer.

LAMEGO, a city of Portugal, in the province of Beyra. It is situated on the south side of the river Douro. The country which surrounds it yields the best port wine, and in large quantities. As the roads in Portugal are generally bad, the mercantile company of the higher Douro have in some measure obviated the evil by constructing a good road from Lamego to Oporto. The wines are now brought with less inconvenience than formerly, and are less subject to impure mixture than when they were transmitted by the internal voyage on the river. Lamego is a bishop's see, and has a splendid cathedral, library, vineyards, and a fair. It has one ruined castle, one parish church, four monasteries, one hospital, one alms-house, 1648 houses, and 6592 inhabitants.

LAMENTATIONS, a canonical book of the Old Testament, written by the prophet Jeremiah (according to Archbishop Usher and some other learned men, who follow the opinion of Josephus and St Jerome) upon occasion of Josiah's death. But this opinion does not seem to agree with the subject of the book, the lamentation composed by Jeremiah on that occasion being probably lost. The fifty-second chapter of the book of Jeremiah was probably added by Ezra as a preface or introduction to the Lamentations. The first two chapters are employed in describing the calamities of the siege of Jerusalem; in the third the author deplores the persecutions which he himself had suffered; the fourth treats of the desolation of the city and temple, and the misfortunes of Zedekiah; the fifth chapter is a prayer for the Jews in their dispersion and captivity; and at the close of all, the author speaks of the cruelty of the Edomites, who had insulted Jerusalem in her misery. All the chapters of this book, except the last, are in metre, and digested in the order of the alphabet, with this difference, that in the first, second, and fourth chapters, the first letter of every verse follows the order of the alphabet, but in the third the same initial letter is continued for three verses together. This order was probably adopted that the book might be more easily learned and retained. The subject of this book is of the most moving kind; and the style throughout is lively, pathetic, and affecting. In this kind of writing the prophet Jeremiah was a great master, according to the character which Grotius gives of him, *Mirus in affectibus concitandis.*

LAMIÆ, a sort of demons who had their existence in the imaginations of the heathens, and were supposed to devour children. Their form was human, resembling beautiful women. Horace makes mention of them in his Art of Poetry. The name, according to some, is derived from *lanio*, to tear; according to others, it is a corruption of a Hebrew word signifying to devour. They are also called *larvæ* or *lemures.*

LAMINGTON PRIORS, a town of the hundred of Knightlow, in the county of Warwick, in a pleasant situation on the banks of the river Leam, ninety miles from London, and two from Warwick. Owing to the discovery of some mineral springs of several kinds, it has grown in a few years from a village to a handsome and considerable town, frequented by numerous visitors both for health and amusement. An hotel, a church, and a market, have been erected, with conveniences for bathing and drinking the waters. The population amounted in 1801 to 315, in 1811 to 543, in 1821 to 2183, and in 1831 to 6209.

LAMJUNGH, an extensive district in Northern Hindustan, tributary to the Ghoorkhali rajah of Nepaul. It has the great Himalaya ridge for its northern boundary; and, like the rest of Northern Hindustan, it has an elevated and rugged surface, with intervening fertile valleys, watered by streams from the northern mountains. The district has been imperfectly explored. The principal towns are Mucundnath and Lantargur.

LAMMAS-DAY, the first of August, so called, as some will have it, because lambs then grow out of season by becoming too large. Others derive it from a Saxon word, signifying *loaf-mass*, because on that day our forefathers made an offering of bread prepared from new wheat.

LAMOIGNON, CHRETIEN-FRANÇOIS DE, eldest son of M. Lamoignon, first president of the parliament of Paris, was born in that city on the 26th of June 1644. Not choosing to intrust his education to any one, his father became his first instructor, and taught him the elementary parts of learning. After having attended a course of rhetoric under Rapin, young Lamoignon applied himself to the study of law, and in this pursuit found great assistance in the conferences of the advocates whom the president assembled at his residence. It was the wish of the president that his son should first appear at the bar as a simple advocate; and, accordingly, the latter continued for about two years in the ordinary practice of the profession. Possessing a refined taste, and full of the good principles which he had derived from the study of the ancients, the young lawyer brought to the courts of law that judicial eloquence which the mania for citation and false display had exiled from their precincts. In 1666, he was appointed counsellor to the parliament. Two years afterwards, when the plague had appeared at Soissons, and apprehensions were entertained that the contagion might reach Paris, M. de Lamoignon was employed to take the necessary measures for arresting its progress. In the discharge of this duty he displayed equal energy and intelligence. Whilst abundant resources of medicine were accumulated at Soissons to combat the evil at its source, he established a sanitary line or cordon, which completely intercepted all communication with the centre of infection. He had himself written out the details of this operation, so foreign to the nature of his ordinary pursuits, but which was nevertheless crowned with complete success. Being appointed master of requests some time afterwards, he was one of the commissioners whom Louis XIV. formed into a particular council, when he himself held the seals after the death of the chancellor Seguier. In 1674, he was appointed advocate-general to the parliament, an office which had become vacant by the death of a son of the celebrated Bignon. During the twenty-five years that he held this office, he rendered the most important services to jurisprudence; and if the eloquent pleadings he pronounced have not been preserved, history has at least transmitted to us the sentiments of admiration which they excited. It is to a discourse pronounced in the cause of the Marquis of Langey by this celebrated magistrate, who knew so well how to reconcile the interests of morality and society with the respect due to laws consecrated by long usage, that France owes the abolition of the *congress* (a court for proving virility or impotence), an institution worthy of the rude age that gave it birth, but which had hitherto been preserved. It was in conformity with his conclusions that the decree of abolition was pronounced by the first president, his father. Louis XIV. had thought of Lamoignon for the situation of first president of the parliament; a mistake, perhaps even an intrigue, had deprived him of that of attorney-general, which was given to Labriffe; but the distinction with which he exercised the functions of advocate-general, his zeal, and his marked predilection for that office, induced him to retain it eight years after he had been made president *à mortier*, that is, in 1690. In 1707, when enfeebled by the excessive labour he had undergone, he resigned in favour of his eldest son, and died on the 7th of August 1709. M. de Lamoignon loved and cultivated letters; and his intimate connections with some of the greatest geniuses of his age, particularly with Bourdaloue, Boileau, Racine, and Regnard, have also added to his celebrity. It is to him that the sixth epistle of Boileau is addressed. But notwithstanding his friendship for men of letters, he refused to become a member of the French Academy, when that society called upon him to join it; though he afterwards accepted a place in the Academy of Inscriptions, of which he became president. The only production of M. de Lamoignon that has been printed is his letter on the death of Bourdaloue, which is appended to the third volume of the *Carême* of that celebrated preacher; but he also wrote a life of his father, Guillaume de Lamoignon, which is said to breathe the most ardent filial piety and affection. (A.)

LA MOTTA, a town of Italy, in the Austrian delegation of Treviso. It stands at the junction of the rivers Montegano and Livenza, is defended by a castle, and contains 3276 inhabitants.

LAMP,

A CONTRIVANCE for giving light. Lamps were in general use amongst the Jews, Greeks, and Romans. The candlestick with seven branches, placed in the sanctuary by Moses, and those which Solomon afterwards prepared for the temple, were crystal lamps filled with oil, and fixed upon the branches. The lamps or candlesticks made use of by the Jews in their own houses were generally put into a very high stand on the ground. The lamps supposed to be used by the foolish virgins, in the gospel, were of a different kind. According to critics and antiquaries, they were a sort of torches, made of iron or potters' earth, wrapped about with old linen, and moistened from time to time with oil. (Matth. xxv. 1, 2.) The lamps of Gideon's soldiers were of the same kind. The use of wax was not unknown to the Romans, but they generally burned lamps; and hence the proverb *Tempus et oleum perdidi*, I have lost my labour. Lamps were sometimes burned in honour of the dead, both by Greeks and Romans. The testimony of Pliny, St Austin, and others, have led many to believe that the ancients had the invention of perpetual lamps; and some moderns have absurdly attempted to find out the secret. The curious may read Dr Blot's conjectures on the subject in the *Philosophical Transactions*, No. 166.

ubstances sed for urning.

Lamps are usually fed by expressed oils from vegetable or animal substances. In Britain, whale-oil, boiled from the subcuticular fat of the whale, is used for common lamps.

Tallow is one of the most common substances employed for giving light. The spermaceti, which is found within the cavity of the cranium of the spermaceti whale, is also used. There is a substance resembling spermaceti, formed by the decomposition of the muscular flesh of animals in moist places, which has been employed. Bees' wax, a vegetable substance collected by the bee, and which, in some of its qualities, resembles the essential oils, is one of the best materials for giving light.

In no region of the globe are human beings found to exist without a supply of oil derived from animals or from vegetables; and in the more fertile regions several different plants, peculiar to each region, are cultivated on account of the fixed oil which is extracted from their seeds by pressure. These oils vary in quality. The oils fit to be employed in food are the most valued. Of the rest, many have the qualities which fit them for burning in lamps.

At Paris, oil of rape-seed and oil of poppy-seed are clarified for the lamp by filtering through cotton wool, and other processes. In the south of France and Italy the inferior kind of olive oil is used in lamps, and sometimes the oil of the plant called *Arachis hypogœa*, or earth-nut. In Italy, lamp oil has been expressed from the stones of the grape. In Piedmont, walnut-oil is used for lamps. On the eastern and southern coasts of the Mediterranean, and in China, they use oil of sesamum seed, called in Arabic *semsom*. In tropical countries, cocoa-nut oil, which, in the temperature of Britain, is solid and white like tallow, is burned in lamps made of the shell of the cocoa-nut and of bamboo. Much of the oil used in China is obtained by expression from the seeds of the tree called by botanists *Camellia oleifera*, which is extensively cultivated for that purpose, as is the shrub called *Croton sebiferum*, on account of the solid oil or tallow which the Chinese express from its fruit. Essential oils, extracted from plants by distillation, are too volatile, and, in consequence of their volatility, are too easily inflamed, to be used in lamps.

Petroleum and naphtha issue from the earth in several places, and these sources are generally in secondary strata, and originate from fossil vegetable matter, in a state approaching to that of pit-coal. A source of petroleum existed some years ago near Colbrook Dale, and there is one at St Catherine's near Edinburgh. The greatest natural deposits of petroleum and bitumen are in the island of Trinidad, and in the Dead Sea in Judæa. Naphtha is the most liquid of the oils proceeding from fossil vegetable matter, and possesses qualities very fit for burning in lamps. It is employed for this purpose at Genoa, where the streets are lighted with naphtha from Amiano in the adjacent territory. Naphtha, obtained in the state of a clear, colourless liquid, by distillation from pit-coal, has of late been employed for burning, in street lamps, in London.

Alcohol or spirit of wine, being cleaner than oil, is convenient for feeding a lamp that serves to heat a liquid in a small vessel; but the flame is blue, and therefore it is not suitable for giving light. In a spirit lamp, the surface of the spirit must be covered to exclude the air, for the spirit would catch fire if its surface were exposed.

Sulphuric ether is too easily inflamed, and too costly to be used for feeding lamps.

The wick.

In a lamp for the purpose of giving light without a considerable quantity of heat, it is required that only a small portion of the oil shall be inflamed at once; therefore, by means of the wick, a small portion of oil, minutely divided so as to expose a large surface, is subjected to the action of the heat; the heat decomposes the oil, and the gas resulting from the decomposition is burned by the atmospheric air which surrounds the wick. In the gas lights, which have come into general use in manufactories and cities in Britain, the operations of producing the gas and inflaming it, which take place at one time in the wick of a lamp, are performed separately. The gas is obtained from pit-coal, oil, or wood, but best from pit-coal or from oil, by heating these substances strongly in a retort; and, when extricated, is conveyed away in pipes to the place where it is to be inflamed. The capillary attraction of the filaments of the cotton which compose the wick of a lamp, raises up a small portion of oil into a situation where it may be exposed to the degree of heat necessary for producing flame.

In lamps of the most common structure, the wick should not be elevated too high above the surface of the oil; for, in that case, the capillary action by which the oil rises between the filaments of the cotton will not be able to raise it to so great a height. If the wick is too little elevated above the surface of the oil, there will not be a sufficient quantity of the oil converted into the gas, whose combustion constitutes the flame, and the flame will be too small.

Many lamps used by the Greeks and Romans have been found in the ruins of ancient towns. These ancient lamps are of pottery, painted and sculptured with various ornaments, and of bronze. The surface of the oil in the reservoir is nearly on a level with the lighted part of the wick, which emerges from a projecting beak at the side of the reservoir.

Varieties in the structure of lamps.

The lamp commonly used in rooms at Florence consists of a round reservoir, with four beaks projecting from four opposite points of its circumference; through the middle of the reservoir a vertical stalk passes; and on this stalk the lamp may be raised or slid down. The stalk is fixed in a foot that rests on the table, and the whole is made of brass.

A lamp, which affords a faint light, is made of a waxed wick, an inch long, passed through the centre of a thin round piece of cork, and of a piece of card placed above the cork. Some oil is placed on the surface of water in a glass tumbler, and the cork, with its wick, is laid upon the surface of the oil. This lamp, called a *veilleuse*, is commonly used in Paris for burning in bed-rooms during the night, as rush-lights are in London.

The lamp with a hollow cylindrical wick, which receives a current of air, both on the outside and the inside of the cylinder, is called in England an *Argand lamp*, from the name of one of the first makers. The wick in Argand's lamp, as first constructed, was raised by a rack and pinion; but the method now employed to raise the wick consists in a spiral notch, which goes round outside of the interior tube. The inside of the ring to which the wick is attached has a tooth which fits into this notch.

At fig. 2, Plate CCCXXI., is a representation of the most usual form of the Argand lamp. A is a reservoir, which is air-tight at top, and has the neck immersed in oil, so that oil flows out of it only when the external air is admitted to ascend through the neck: it contains a short column of liquid, from the top of which the pressure of the atmosphere is excluded, and therefore the column is sustained by the weight of the atmosphere pressing on its base, on the same principle as a bird-cage fountain.

Oil is introduced into the reservoir A, by taking it off, and holding it with the neck uppermost. The sliding tube Q is pushed so as to uncover the hole *t*, and the oil is poured in by the hole *t;* when this is done, the hole is again covered by the sliding tube, and the reservoir A is replaced in F. When the lamp is to be lighted, the hole *t* is opened by depressing the sliding tube by its handle *z*, and the oil will flow out of A till it rise in F, and in the annular cavity that contains the wick, to the level of the top of the hole *t*. When the oil in F is lowered by the burning of the lamp, so that the surface of the oil in F is below the upper part of the hole; then a bubble of air ascends into A, and a quantity of oil descends into F, till the surface of the oil rises again to cover the upper part of the hole. It sometimes happens that the air in A is heated by the warmth of the room, and then too great a quantity of oil descends into F, in consequence of the expansion of the hot air in the upper part of A, so that the oil not being all consumed in the wick, falls down through the tube *g*, and may even run over from the cup P. This is a considerable inconvenience attending oil reservoirs of the construction here mentioned. The hole *t* is closed by drawing up the sliding tube Q, when the lamp is not burning, in order that the lamp may be inclined, without making the oil descend from the reservoir.

The cylindrical part, where the flame is produced, is composed of three tubes *d, f, g.* The tube *g* is soldered to the bottom of the tube *d*, just above *o*, and the interval between the outer surface of the tube *g* and the inner surface of the tube *d*, is an annular cylindrical cavity closed at bottom, containing the cylindrical cotton wick immersed in oil. The wick is fixed to the wick tube, which is capable of being moved spirally; within the annular cavity is also the tube *f*, which is capable of being moved round, and serves to elevate and depress the wick. P is a cup that screws on the bottom of the tube *d*, and serves to receive the superfluous oil that drops down from the wick along the inner surface of the tube *g*. The air enters through the holes *o o*, and passes up through the tube *g* to maintain the combustion in the interior of the circular flame. The air which goes to perform the combustion on the exterior part of the wick enters through the holes *m*, with which *r n* is perforated. When the air in the chimney is rarefied by the heat of the flame, the column of the atmosphere, of which the chimney is the base, becomes lighter than the surrounding columns; and the surrounding columns, pressing with their excess of weight, enter the lower part of the chimney, and pass upward, with a rapid current, to restore the equilibrium between the adjacent columns of the atmosphere.

In some lamps, above the orifice of the tube *g*, and nearly at the height of the top of the flame, there is placed a circular plate of metal, of the same diameter as the tube: this has the effect of turning the current of air into that part of the flame where smoke would otherwise be produced. The same effect is obtained by the contraction of the cylindrical glass chimney at R G: the contraction of the chimney was commonly employed in Paris before it was used in England.

The oil flows from the reservoir A and F through N, and occupies the cavity between the exterior surface of the tube *g*, and the inner surface of the tube *d*. The oil rises in the annular cylindrical cavity between these two tubes to the level of the opening *t*. The part *w i* is a short tube, which receives the circular wick, and slides freely on the tube *g*. The tube *g* has a hollow spiral groove on its exterior surface, into which enters a pin *k*, connected with the wick-tubes *w i*. The wick-tube has a catch, which works in a perpendicular slit in the tube *f;* and, by turning the tube *f*, the wick-tube will be raised or lowered; *r n* fits on the tube *d; r n* is fitted to receive the glass chimney R G; a wire *s* is attached to the tube *f*, and is bent over the edge of the tube *d*, and descends along the outside of the tube *d*. The part *n r*, that supports the glass chimney, is connected, by four other wires, with the ring *y*, which surrounds the tube *d*, and is capable of being moved round. When *n r* is turned round, it carries round along with it the ring *y*, the wire *s*, and the tube *f*, and thereby operates the elevation and depression of the wick.

The glass chimney which rests on R N is wider at bottom, and then is contracted at R G, for the purpose of making the air rush upon the external part of the circular flame in a denser current.

In the most simple construction of lamps, the surface of oil in the oil-reservoir is nearly on a level with the flame, because the capillary attraction of the wick can only raise the oil a little above the surface of the reservoir. The surface of the reservoir also is considerable, that the lamp may burn for a sufficient length of time, before it has consumed so much oil as to reduce the level of the oil below the reach of the action of the capillary attraction of the wick. Mechanists have contrived and executed lamps of various forms, with the view of removing the inconvenience of the shadow of the reservoir, which is inherent in the common lamp with one lateral beak.

One of the contrivances for diminishing the bulk of the part in which the wick is immersed, and for obtaining a supply of oil, is the bird-cage fountain reservoir described above as being usually applied to Argand lamps. This kind of reservoir is described by Cardan, and a lamp fed by it is mentioned by several writers under the name of Cardan's lamp.

Baptista Porta, in treating of oil reservoirs of the kind just now mentioned, proposes that, for large lamps with many wicks, the reservoir should be placed above and without the room, and should communicate with the lamp within by a pipe. In this way, the oil would not be liable to be pressed out too rapidly by the expansion of the air in the reservoir, occasioned by the heat of the room; and several methods have been contrived for the purpose of placing the luminous part of the wick on the upper end of a stalk, so that very little of the sphere of rays proceeding from the lighted wick may be intercepted by the opaque part of the lamp. The following are some of these methods:

A lamp called the Amiens lamp, commonly used in Paris by the poorer classes, is in the form of a candle. The lighted part of the wick is at top. The lower part of this cylinder, which is of tin, has a valve opening upwards, and is moveable up and down in another cylinder, which has a valve opening upwards. This valve is plunged in the reservoir of oil; when the wick is in want of oil, the oil is pumped up by moving vertically the tin cylinder which contains the wick. Lamps of this kind are described in the *Transactions of the Academy of Sciences* for 1755, p. 139; and for 1760, p. 158.

A lamp for reading is made by Carcel of Paris, in which the oil is raised to the wick by means of a pump. The pump is moved by watch-work, composed of wheel and pinion, and a spring, which is wound up when the lamp is to be lighted.

In the twentieth volume of the *Philosophical Transactions*, St Clair, in a letter to Hooke, describes a lamp, in which the oil floats on water. A tube passes from the upper part of the vessel down to the water; and through this tube water is dropped, by means of which the surface of the oil is always maintained at the same level, whilst it is consumed by the flame in the wick.

In the lamp constructed by Mr Keir of Kentish Town, the oil is raised to the wick, and sustained by a column of a solution of salt in water. This liquid being of a greater specific gravity, a column of it counterbalances a longer column of oil. The solution of salt is made of such a specific gravity that it will support a column of oil four thirds of its own height. This is nearly the specific gravity of the heaviest saline solution that is known to exist in any great body of natural water, namely, in the Dead Sea; the weight of the waters of this sea, of distilled water, and of oil, being in the relative proportions of 120, 100, 92. To have an idea of this lamp, imagine a syphon with two upright branches, and the junction of the branches at the bottom. The shortest branch has a bulb at top. The longest branch has a bulb near its lower extremity. The shortest branch is filled with a solution of salt, whose upper surface is in the superior bulb. The longer branch contains the oil, and in its upper extremity the wick is placed. In the lower bulb the surface of the oil rests upon the surface of the solution of salt.

The bulbs serve as reservoirs, prolonging the action of the machine; by means of the bulbs and the greater specific gravity of the solution, it is effected, that the abstraction of a considerable quantity of oil by the combustion in the wick occasions but a small depression in the upper surface of the solution; the height of the sustaining column of solution will become shorter in proportion as the column of oil which it counterbalances is consumed; but this diminution of the height of the column of oil will be slow, and therefore the column of oil will for a considerable time be of sufficient length to reach the wick. Suppose an inverted syphon, of equal diameter throughout, the shorter leg of which contains a column of solution of salt, whose height is 75, and this counterbalances a column of oil, whose height is 100, in the longer leg; if now the column of oil in the longer leg be diminished in height by 10, the counterbalancing column of solution will diminish to 67·5, being 7·5 shorter than at first. But if the syphon, instead of being of equal diameter, has two dilatations or reservoirs, whose horizontal section is ten times the area of the tube of the syphon, one of the reservoirs being placed at the top of the short branch, so as to contain the upper surface of the solution of salt, and the other at the bottom of the long branch, so as to contain the surface where the oil rests upon the solution; then, if the same quantity of oil, as in the former example, is taken from the top of the longer leg of the syphon, the column of oil will only fall one tenth of what it did in the undilated syphon of equal diameter, and the solution of salt will diminish one tenth of what it did in the syphon of equal diameter.

The oil-reservoir and the wick remain stationary, and do not descend as the oil is consumed. This descent takes place in two lamps now to be mentioned, because in these two lamps the oil-reservoir swims in a liquid that acts as a counterpoise.

In the lamp contrived by the Chevalier Edelkrantz of Stockholm, the oil-reservoir floats in mercury, and the column of oil is maintained at the requisite height by the counterpoise of a column of mercury; in proportion as the oil is consumed, the oil-reservoir, and the wick which is connected with it, sink.

The general structure of this lamp may be understood by conceiving a flask, with a long narrow neck, and enlarged at the under part. The flask is heavy enough to swim, when it is placed in mercury, with its under part immersed. The bottom of the flask is open. The flask being placed in mercury, is made to float with its neck perpendicular. Oil is poured in at the neck till the flask is full. Then the surface of the mercury at the bottom of the flask and within the flask will be depressed by the weight of the column of oil that rests upon it; and the surface of the mercury on the outside of the bulb or lower part of the flask will stand higher than the surface of the mercury within the flask. The height which measures the difference of level of the two surfaces of mercury will be the height of a column of mercury of equal weight with the column of oil that is in the flask; and as mercury is about 14$\frac{5}{10}$ times the weight of oil, the difference of level of the two surfaces of mercury will be $\frac{10}{145}$ of the height of the oil in the flask. In proportion as oil is abstracted from the upper end of the tube by the combustion in the wick, the height of the column of oil is thereby diminished, and the two surfaces of mercury will come nearer to each other, the flask sinking a little in the mercury. As the area of the horizontal section of the lower part of the flask is much greater than the area of the section of the neck, and as the specific gravities of mercury and oil are very different, it follows, that, to restore the equilibrium after the abstraction of a column of oil from the neck, the surface of the mercury within the lower part of the flask will rise by a much shorter column.

In the lamp invented by Mr Barton, comptroller of his majesty's mint, a solution of salt and water is used as a counterpoise to the oil. The combination consists of a light flask, open at the bottom, floating in a solution of salt, so that when oil is poured into the flask, the surface of the oil in the neck of the flask stands at a higher level than the surface of the saline solution in which the flask swims. The wick is at the upper end of the neck of the flask; and as the area of the horizontal section of the bulb or lower part of the flask is much greater, suppose twenty times greater, than the area of the section of the neck of the flask, it will happen, that when a column of oil an inch high is abstracted from the neck of the flask, the height of the rise of the surface of the solution in the bulb or lower part of the flask will be only one twentieth of an inch. This lamp is represented at fig. 3, Plate CCCXXI.

T is the oil-reservoir, from which the oil passes upwards to the wicks *w*, *w*, *w*. The oil-reservoir is open at bottom, at *h* This is preferable to the mode of making the reservoir with a perforated bottom that screws off for the purpose of cleaning the reservoir. The fluid B, in which the oil-reservoir is immersed, is a solution of salt in water. This liquid is contained in a vessel RMO, which can be unscrewed at O, for the purpose of taking out the oil-vessel. N and Y are two floats fixed to the oil-reservoir and its tube. The column of the solution of salt *c*, *h*, presses against the oil at the open bottom of the reservoir, and maintains a column of oil in the tube to the height *e;* to this point *e* the wick descends, and raises the oil to the flame by the capillary attraction of its fibres. The specific gravities of the oil and the solution of salt must be inversely as the heights *c*, *h* and *h*, *e;* that is, the specific gravity of the solution of salt must be made to bear to the specific gravity of the oil the same proportion that the perpendicular height *e*, *h* bears to the perpendicular height *c*, *h*. As the oil is consumed, the water enters the hole at the bottom of the oil-vessel; the surface of the water at *c* sinks, and the oil-reservoir, with the tube and wicks attached to it, sink also. The upper part of the vessel R should be of a capacity a little less than the capacity of the oil-reservoir, so that, when the water has displaced the oil, and filled the oil-reservoir, the float Y may be at the bottom of the enlarged part of the water-vessel R. To prepare the lamp, the exterior vessel is filled with solution of salt by the opening at *l;* the solution passes into the oil-vessel by the open bottom *h*, and the oil-vessel rests on the bottom of the exterior vessel. The oil is then poured in through the tube *e*. The oil passes into the oil-reservoir, expels the water, and floats the oil-reservoir, raising the surface of the water in R.

An inconvenience affecting Barton's lamp is, that the solution of salt, by the gradual evaporation of the watery part, becomes more dense, and capable of supporting a higher column of oil than it did at first. The lamp of Edelkrantz, which floats on mercury, is not liable to this inconvenience, because the mercury does not alter in density by evaporation. Both these floating lamps have the inconvenience, that the oil is made to run over at the wick by any accidental shock which depresses the floating part of the lamp.

Several lamps have been constructed, in which the oil is raised by the principle of the fountain of Hero of Alexandria, which is known as being employed to raise water in the mines of Chemnitz, in Hungary. In Hero's writings, the application of this machine to raise oil to a lamp is described. Lamps of this construction were made some years ago in Paris by Girard de Marseille. Of this kind is the hydropneumatic lamp made by King, tin and japan manufacturer, of Snowhill, London. This lamp is formed externally like a column eighteen inches high and four inches in diameter; it is made to contain oil enough to last for five or six hours. An idea of its general principle may be formed by means of the diagram at fig. 5, Plate CCCXXI. in which there is a descending tube, with a bulb A at top. The upper part of this bulb is open. The tube, at its lower part, is curved upwards, and dilated into a second bulb B. The tube contains oil, the upper surface of which is in the upper bulb A, and its other surface is in the lower bulb B. From the top of the lower bulb B a tube proceeds to the top of another bulb C, placed higher than the upper bulb A of the first tube. This third bulb C contains oil, and from the bottom of this third bulb the oil rises in a tube. At the upper end W of this tube the wick is placed. The whole machine is closed and air-tight, except at the openings of A and W; and at these openings the pressure of the atmosphere acts. Thus the column of oil contained in the first tube and bulbs A, B, presses, with its own weight and the weight of the atmosphere, on the confined air contained between the second bulb B and the third bulb C, and raises up a column of oil from that third bulb. The top of this column, so raised, is at a higher level than the top of the oil in the first tube, because the bottom of the column, which is raised, is at a higher level than the bottom of the column in the first tube. The whole machine is a syphon, in which a first column of oil of the perpendicular height AB supports a second column of oil CW, not of a greater height than the first column, but, by means of the column of air BC interposed between the two columns of oil, it is effected that the extremity W of the second column of oil is much higher than the upper surface A of the first column of oil. In the lamp constructed on this principle by King, there is a plug and valve which serve for introducing the oil, and other particular contrivances. When the oil is to be poured in, the lamp is inverted.

A lamp, of which the reservoir for the oil is in the form of a hollow ring, was contrived by Count Rumford, and is described by him in Nicholson's *Journal*, vol. xiv. 1806, p. 23. The lamp is in the centre of the ring, with which it communicates by three straight tubes, in the direction of radii of the ring. The stoppers, which close the apertures by which the oil is poured into the ring, have a small hole, which allows the atmosphere to press on the surface of the oil in the ring, and thereby permits it to flow freely to the wick. This small hole may also be placed in some other part of the ring, and not in the stopper. The ring supports an hemispherical shade of roughened glass or of gauze. These glass shades are made rough, not by grinding, but by laying a coat of powdered glass on the smooth surface of the shade, and then exposing it to the heat of a furnace, so that the powdered glass becomes adherent, and produces a rough or frosted surface. This method of frosting glass is practised in some glass-houses situated in that district of Staffordshire called the Potteries. Lamps of this construction may be suspended from the ceiling, or placed on a stand, and are now frequently used in rooms and shops in London and Paris. They are called in London French lamps.

Hooke, in his treatise entitled *Lampas*, published in 1677, describes eight contrivances for supplying oil to a lamp equably, and as long as there remains any oil in the reservoir. This he effects by different methods of counterbalancing the oil. These inventions display Hooke's ingenuity and great knowledge of mechanics, but require nice workmanship, and are not applicable to practical purposes. These counterpoises of Hooke also serve to form a vessel so that the whole liquid may be drawn from it in an equable stream, by tapping the vessel at the top, and to make the descent of the surface of a liquid and its discharge constant and equable in a clepsydra for showing the hour.

Porter's automaton lamp, constructed in London in 1784, is something similar to some of Hooke's contrivances for producing an equable supply of oil to the wick as long as there remains any oil in the reservoir. It does not require such delicacy of execution as Hooke's counterpoised lamps. Porter's lamp is a tin box, the vertical and longitudinal section of which is a rectangular parallelogram, elongated horizontally, of which call A, B the two upper angles, C, D the two lower. This parallelopipedal box is suspended on an axis near the upper surface of the box, at a place which may be denoted by X. The axis is nearer A than B; at A is the wick, and a tube going down to the bottom of the box, along the side of the box AC. When the box is full of oil, then the space XB, behind the axis, being full of oil, counterpoises the shorter space XA. AB, the long side of the box, is horizontal; and the line drawn from the axis of suspension down to the centre of gravity is perpendicular to AB. But when the surface of the oil falls below the axis, then the box turns on its axis, the side A falls, and B is elevated; A being heavier, by reason of the wick and wick-tube, and the side AC assumes a lower position, in proportion as the oil is consumed; the line drawn from the axis down to the centre of gravity becoming more and more oblique to AB. The operation of this lamp depends upon the position of the axis X, and the weight of the wick-tube, which must be accurately proportioned, the one to the other, by trial.

LAMPS FOR LIGHT-HOUSES.

Light-houses are now generally lighted with Argand lamps, which have hollow cylindrical wicks placed before reflecting mirrors. Several of these lamps are fixed on a frame, and protected from the weather by glass windows. The lamps of light-houses are fed with oil, and in some places with pit-coal gas, as in a light-house near Trieste.

In many of the light-houses on the British coast, the frame on which the lamps are fixed is made to revolve by means of clock-work, so that to a spectator situated in the circle of which the light-house is the centre, the light appears at its brightest at the end of a stated period of time, which is generally one or two minutes. The revolving of the light enables seamen to distinguish the light-house from the light of lime-kilns or other fires upon the coast. This distinction is of great importance; for shipwrecks have happened in consequence of mistaking the light of lime-kilns for the light of a light-house. The light is in some light-houses made of a red tinge, to distinguish it from some other light-house not far distant. The red colour of the light is produced by placing windows of red glass before the lamps. Red is the only colour that can be given to the light in this way. When stained glass of other colours is placed before the lamp, it is not found to produce a change in the colour of light seen at a distance; the blue or green colour of the glass becomes insensible when seen through a great body of air, which has itself a blue colour.

LAMPS FOR LIGHTING STREETS.

Till within the last six years, the street-lamps used in London and in other parts of Britain consisted almost uniformly of a deep inverted bell-shaped glass lantern, blown of one piece, and suspended by the edge in an iron ring, with a tin conical cover perforated to give issue to the smoke, and within the lantern a flat oil-vessel, with two or more wick-holders or beaks projecting from its circumference. Many districts of London are lighted with lamps of this form; other districts employ several kinds of street-lamps of a different form. The first of these new kinds was made under the direction of Lord Cochrane, and employed to light the streets in the parish of Saint Anne, Soho, London.

The lanterns which serve to protect the light from wind and weather in the new lamps in one district of London, are composed of four lateral panes and a bottom of glass, joined together by sheet iron, so that the lantern is in form of a truncated pyramid, inverted like the lanterns of the street-lamps in Paris. In lanterns of this form some light is intercepted, and a shadow is thrown on the street by the metal that unites the panes. This defect does not occur in the lanterns of street-lamps most commonly used in England, and made of one piece of glass blown into the form of a spheroid. The spheroidal lanterns deflect the light more, because they are more unequal in thickness, but this is a smaller inconvenience; the lanterns blown of one piece of glass are more easily cleaned. Many of the lanterns for gas-lights are also made of panes in the above-mentioned form; some are cylindroids blown of one piece, with a hole in the bottom to admit air. In some of the new lamps in London which have lanterns of one piece of glass, the form of the lantern is nearly cylindrical; in others the lantern is not so deep as the lanterns of the old form. The new lamps have reflectors placed above the light, for the purpose of reflecting the light downwards on the foot pavement. These reflectors are of various forms in some of the lamps, the four plane surfaces of the inside of the pyramidal cover of the lantern are made bright, and serve to reflect the light downwards. In other lamps the ceiling of the lantern is a reflector in form, having a small portion of a large curved surface, with a chimney in the middle to give issue to the smoke. Others have two, and sometimes three, concave conoidal reflectors, whose vertices meet over the light, the axes of two of the reflectors being parallel to the direction of the street; at the point where the reflectors meet there is a chimney, through which the smoke ascends. The reflectors require to be frequently wiped in order to keep them bright.

The oil-vessels of the new lamps in London are of various forms; the beak or part of the oil-vessel under the wick is made as narrow as possible; for as it is very near the flame, its shadow thrown on the street by the rays diverging from the flame is several feet in breadth. If the beak be an inch broad, and situate an inch under the flame, the shadow of the beak on the pavement under the lamp will be ten feet broad if the flame is situate ten feet above the pavement. In some of the new lamps the reflector placed above the light is made with its concavity so disposed at the edges that the reflected light is thrown upon that part of the pavement which is under the oil-holder. In Major Cochrane's lamps the oil-vessel consists of a bird-cage fountain reservoir, which allows a supply of oil to come down to the wick when the surface of the oil in which the wick is placed has sunk to a certain point. The wick is double, consisting of two pieces of flat cotton web; between the wicks is a slit, through which a current of air ascends to the flame; on the outside of each wick is another slit; and these slits admit currents to the exterior surface of the wicks. Each time that the lamp is trimmed two pieces of wick are inserted, just sufficiently long to last the time that the lamp is required to burn. Naphtha distilled from pit-coal is burned in these lamps, and the light is brilliant like the light of coal-gas. But the gas-lights have the advantage of being unencumbered by the opaque substance of the oil-vessel, which intercepts light, and casts a shadow on the street.

The street-lamps in London are fixed at the end of iron rods which project from the walls of the houses. The lamp is, over the middle of the foot pavement, ten feet from the ground. There is a row of lamps on each side of the street, the principal streets being fifty feet in width. In Paris, where many of the principal thoroughfare streets are not above twenty-five feet in breadth, the lamps are suspended over the middle of the street. A strong rope is made fast to the walls on each side of the street, and to this rope a smaller rope with the lamp is attached. The smaller rope passes over pullies, and its end comes down into an iron box, where it is fixed on a hook. The iron box is unlocked, and the lamp is let down and lighted with a candle. The light is placed before a silver-plated reflector. In Vienna, the street-lamps are fixed on the upper end of a post. The lamp is taken out of the lantern by means of a pole, and lighted at the foot of the post. This saves the inconvenience which results to passengers from the mode of lighting lamps by a man with a ladder and torch, as practised in Britain. In most of the towns of Italy the streets are but sparingly lighted. The lamps are fixed at the end of iron rods which project from the walls of the houses. In some of them the light is placed in the focus of a parabolic reflector, or at the meeting of the vertices of two concave conoidal divergent reflectors situated above the light. The French, when masters of Italy, made regulations to improve the lighting of the streets.

In England, whale-oil is used as the combustible material in the street-lamps; of late naphtha, obtained from the distillation of pit-coal, has been used in a district of London which is lighted with Major Cochrane's lamps. This naphtha is a clear and colourless liquid, and is found to give a good light; it requires to be prepared with particular attention; that made at the gas-light work is said to be too easily inflammable. In Paris, rape-seed oil and poppy-seed oil are used; these expressed oils are made in the north-eastern part of France, and in Flanders. In the south of Europe, olive-oil of inferior quality, and walnut-oil, are used. Street-lamps lighted with the gas distilled from pit-coal were in 1821 employed in the principal streets of London, Edinburgh, Glasgow, Liverpool, Manchester, Birmingham, Sheffield, and other cities in Britain. The use of coal-gas for giving light had made very little progress in France in 1818, being scarcely employed even in Paris, and we believe not at all at Lyons, although pit-coal is abundant, and commonly used as fuel there. In 1818, pit-coal gas was used for lighting a light-house on the Adriatic, in the dominions of the house of Austria near Trieste, the gas being obtained from the coal wrought in the adjacent country.

SAFETY LAMP.

This lamp was constructed for the purpose of giving light in mines where fire-damp prevails. In many of the collieries of Britain, Flanders, and other countries, fire-damp, consisting of carburetted hydrogen, issues from different parts of the strata of coal when the coal is worked; and when the fire-damp is mixed with a certain proportion of atmospheric air, it explodes by the flame of the miner's candle, burning the workmen severely, and often depriving them of life. Vegetable substances, in the slow decomposition which takes place in them, in the process of putrefaction, give out inflammable gas. This is seen when the leaves of plants fall into water and become putrid; inflammable gas then rises to the surface in bubbles, and is inflamed if a light be applied to the surface of the water. Vegetable matter gives out inflammable gas also in the rapid decomposition occasioned by fire. The flame of vegetable substances consists of the inflammable air resulting from their decomposition, and burning with the addition of the air of the atmosphere. Pit-coal consists of the remains of large quantities of vegetable substances; and the fire-damp of coal-mines may be considered as the produce of the putrefaction which the vegetable matter has undergone, or of some decomposition that the coal is still undergoing. Sir Humphry Davy found that, on breaking some masses of coal under water, inflammable gas was given out. In some places blowers of fire-damp issue out at the surface of the earth. A quarter of a mile from Pietra Mala in the Apennines, on the road from Bologna to Florence, there is a blower of inflammable gas issuing from the ground, and proceeding from strata of schistus, and perhaps of coal. Sir Humphry Davy analysed this gas, and found it to be carburetted hydrogen, like the fire-damp of the coal mines. Another blower of the same kind exists on the side of a mountain near the shore of the Gulf of Adalia, in Lycia, on the south coast of Asia Minor. In mines wrought to obtain metals and salt, where there are no strata of vegetable matter like coal, it does not appear that the fire-damp occurs.

The merit of that very ingenious and most useful contrivance, the Safety Lamp, is wholly due to Sir Humphry Davy. After having made many experiments for the purpose of forming a lamp to give light in coal mines affected with fire-damp, without occasioning explosions, which frequently proved fatal to the miners, he found that wire-gauze, of which the apertures occupy more space than the cooling or radiating surface of the wire, so as to be permeable to air and light, offered a perfect barrier against explosion; because, although the gas was inflamed within the enclosures formed by the wire-gauze, yet the heat being communicated to the numerous surfaces of the wire, the gas on the outside of the wire enclosure was not inflamed. Wire-gauze is the best material for safety lamps, as it affords the greatest extent of radiating surface, and, by cooling, prevents all explosions that require a temperature higher than the temperature of the atmosphere. An example of the radiating and cooling action of wire is seen in the fire-guards of wire, which are hung upon the ribs of fire-places in rooms to prevent sparks from being thrown into the room. These fire-guards, although they are very near the fire, do not become hot. The apertures of the wire-gauze must be smaller, and the wire, which is the radiating and cooling surface, must be in greater quantity, in proportion as the gas in which the lamp is to be used is more inflammable. The fire-damp in coal-mines is in almost all cases carburetted hydrogen; and for excluding explosion from a lamp in that gas, it is found that the wire-gauze should contain 784 apertures in a square inch.

The wire-gauze should be of iron or copper. Fine brass wire is improper, because it is too easily combustible by reason of the zinc it contains. The iron wire should not be tinned, tin being too easily combustible. The body of the lamp should be of copper riveted together, or of massy cast brass or cast iron. The screws should fit tight; no aperture, however small, should be suffered to exist in the body of the lamp; and the trimming wire should move through a long tight tube.

The safety lamp is represented in Plate CCCXXI. fig. 4. A is the cistern containing the oil; B the brass rim to which the bottom of the wire-gauze cylinder is fastened by a screw, to prevent it from being separated from the lamp; C is the safe feeder through which oil is poured into the lamp; E the safe trimmer, a wire which passes through a safe tube, for the purpose of raising and trimming the wick; F the wire-gauze cylinder. The longitudinal suture where the two edges of the piece of wire-gauze that forms the cylinder meet, must be well doubled and fastened with wire. If the cylinder is of twilled wire-gauze, the wire should be of iron or copper, at least of the thickness of $\frac{1}{40}$th of an inch; if of plain wire-gauze, the diameter should not be less than $\frac{1}{60}$th of an inch. The number of apertures in a square inch should not be less than 786. The wire-gauze cylinder F is closed at top by a circular piece of wire-gauze, and above this is placed a second top, G, which fits on the cylinder like a cap. In the figure the circular wire-gauze top of the wire-gauze cylinder is seen at G through the wire-gauze of the cap. The circular top of this wire-gauze cap is $\frac{3}{4}$ths of an inch above the top of the wire-gauze cylinder F. I I are thick wires surrounding the wire-gauze cylinder, to prevent it from being bent by external force. K is a ring to hang up the lamp, or to hold it by. The most convenient size for the safety lamp is a span, that is, from 8 to 10 inches high, the wire-gauze cylinder being 2 to 2½ inches in diameter.

The wire-gauze, when choked with coal-dust, requires to be cleaned by means of a brush, in order to transmit the light.

In figure 4, a lens of glass, L, is placed before the light; sometimes a piece of tin is placed within the cylinder to act as a reflector.

The light of the safety lamp, without a reflector, was found to be nearly equal to the light of a common miner's candle.

Flame produced by the combustion of explosive gases may be extinguished by colder metal. The temperature of metal, even when heated to a white heat, is less than the temperature of flame, and therefore red-hot wire-gauze in sufficient quantity, and of the proper degree of fineness, will abstract sufficient heat from the flame of carburetted hydrogen or fire-damp to extinguish that flame.

Flame, in all cases, is considered to be the combustion of an explosive mixture of inflammable gas and air. If a piece of wire-gauze is held over the flame of a lamp, it prevents the flame from passing. The air that passes through is very hot, and is in the state of an explosive mixture, for it will be inflamed if a lighted taper be presented to it. But it is cooled below the exploding point, by passing through the wires, even if the wires are red hot; it is also cooled by being mixed with a considerable quantity of air comparatively cold. The temperature of visible flame is very high, as is seen by the fusion of a small filament of that difficultly fusible metal platinum, which happens when the filament is held in the flame of a candle. A considerable mass of heated metal is required to inflame fire-damp. An iron wire of $\frac{1}{20}$th of an inch in diameter, and 8 inches long, red hot, when held perpendicularly in a stream of fire-damp, did not inflame it. But wire of the same size, when six inches of it were red hot, and when it was held perpendicularly in a bottle containing an explosive mixture, so that successive portions of the gas were heated by the wire, produced an explosion.

The action of the safety lamp may be exhibited in the chemist's laboratory, by pouring some ether into the bottom of a large jar; the vapour of the ether mixing with the air, produces an explosive atmosphere. When the safety lamp is lighted and placed in the jar, the explosive mixture from the ether will burn within the wire-gauze lamp, without inflaming the gas that is without it.

The workman who has only a single gauze lamp, and finds the temperature of the wire increasing rapidly by the fire-damp from a blower, can easily diminish the heat by standing between the current and the lamp, that is to say, to the windward of the lamp, or by sheltering the lamp from the current by interposing his clothes; or, by bringing the lamp nearer the orifice from which the fire-damp issues, he may extinguish it. There never can be any occasion for the workmen to place the lamp in the exact place, when two currents, one of common atmospheric air, and the other of fire-damp, meet each other.

When the fire-damp is inflamed in the wire-gauze lamp, coal-dust thrown into the gauze cylinder burns with strong flashes; but the explosion is not communicated to the external fire-damp by this means.

Phosphorus, sulphur, pyrites, or gunpowder, would produce explosion by being applied to the outside of the wire-gauze cylinder; and sulphur, to produce this effect, must be applied in large quantities, and blown upon by a current of atmospheric air. But there is little danger of these substances being accidentally applied to the safety lamp in mines.

When a wire-gauze lamp is made to burn in a very explosive atmosphere at rest, the heat of the wire-gauze, when the fire-damp is burning within the lamp, soon arrives at its maximum, and then diminishes. The coally matter also, from the decomposition of the oil, chokes the upper apertures of the wire-gauze, and thus gradually diminishes the heat, by diminishing the quantity of gas consumed. Wire-gauze lamps which had been used by workmen for several months, and which had been often red hot in explosive atmospheres, were nevertheless still unimpaired and perfect.

Where the lamp is placed in a current of explosive gas, a greater heat is produced; and in this case the radiating or cooling surfaces should be increased. Twilled gauze or a double or triple fold of wire-gauze on one side of the lamp, or a skreen of metal between the lamp and the current, or a semi-cylinder of glass or mica within, answers the object of preventing the heat from rising to redness.

If the heat of the iron wire-gauze rose to that of a strong welding heat, a circumstance which never could happen in a colliery, then the iron wire would burn, and the lamp would be no longer safe.

From a mine of Lord Durham's there is a violent blower of fire-damp conveyed to the surface, upon which the following experiment was made: A brass pipe was fixed upon the blower-tube, so as to make the whole stream of fire-damp pass through an aperture of less than half an inch in diameter. The fire-damp, when inflamed, issued from this with great violence and noise, forming a flame of five feet long. This blow-pipe was exposed at right angles to a strong wind. The double gauze lamps soon became red hot at the point of action of the two currents; but the wire did not burn, nor did it communicate explosion. The single gauze lamp did not communicate explosion as long as it was red hot, and slowly moved through the currents; but when it was fixed at the point of the most intense combustion, it reached a welding heat; the iron wire began to burn with sparks, and the explosion then passed.

In other experiments on this blower of fire-damp, single wire-gauze lamps, with slips of tin-plate on the outside or in the inside, to prevent the free passage of the current, and double lamps, were exposed to all the circumstances of the blast; but the heat of the wire never approached near the point at which iron wire burns, and the explosion was not communicated. The flame of the fire-damp flickered and roared in the lamps, but did not escape without the limits of the wire-gauze.

The sparks from a flint and steel mill, a machine which sometimes has been used to give light in mines affected with fire-damp, would most probably inflame such a current as the blower above mentioned; because the sparks elicited from steel by the collision of flint, are small portions of the steel in a burning state, as may be seen by collecting these sparks on a sheet of paper, and viewing them with a microscope.

The *lamp without flame*, which is sold as an object of amusement and curiosity, consists of a fine wire of platinum of the $\frac{1}{100}$th of an inch in diameter, coiled into a spiral, and placed round the wick of a lamp fed with the spirit of wine, and a little above the wick; when the flame of the lamp is blown out, the heat which the wire has acquired is sufficient to keep up the slow combustion of the vapour of the spirit of wine, and this combustion continues to keep the platinum in an ignited state. The principle of this lamp without flame may be usefully applied to the safety lamp. By hanging some coils of fine wire of platinum above the wick of the lamp, it is believed that the coal-miner will be supplied with light in mixtures of fire-damp, which, from the small proportion of atmospheric air, are no longer explosive; and should the flame of the lamp be extinguished by the quantity of fire-damp, the glow of the incandescent platinum will continue to give light, and the incandescence will cease when the air becomes unrespirable. Sir Humphry Davy found, that a spiral wire of platinum of the $\frac{1}{60}$th or $\frac{1}{70}$th of an inch in diameter, suspended within the safety lamp, yields light in a mixture of fire-damp with atmospheric air, in which the atmospheric air is in so small a proportion that the mixture is not explosive. In this situation, the heat is not sufficiently great to produce combustion with flame, and combustion without flame takes place. The platinum wire, heated by the flame of the lamp, retains its heat after the flame is extinguished, and this heat is sufficient to occasion a slow combustion or combination of the elements of the fire-damp with the oxygen of the atmospheric air: this slow combustion produces sufficient heat to keep the platinum in a state of ignition. Platinum and palladium are the only metals found to produce this effect, because these two metals are of a slow conducting power and capacity for heat. This phenomenon takes place in mixtures of gas where there is common air enough to support the respiration of human beings.

At Wallsend, and other extensive collieries near Newcastle, in Northumberland, the following regulations respecting the safety lamps are observed: A steady man is employed to take charge of the lamps, and he is responsible for keeping them in good order. A chamber is allotted him, in which he keeps oils, cotton, and spare lamps; the chamber is in a secure part of the mine, as near the workings as possible. The brass collar of the wire-gauze cylinder is secured to the bottom of the lamp by a lock, which can be opened only by the lamp-keeper; so that the workmen cannot separate the wire-gauze cylinder from the bottom of the lamp. After finishing their day's work, the colliers bring the safety lamps to the lamp-keeper's cabin. The lamp-keeper unlocks the lamps, keeps the bottom, and allows the colliers to take the wire-gauze cylinders home for the purpose of cleaning them. When the colliers return to their work next day, the lamp-keeper, having replenished the lamps with oil and cotton, lights the wicks, screws on the gauze cylinders, and examines them carefully; if any defect appears in the gauze, the lamp is set aside to be repaired. The lamp-keeper's business, during the day, is to walk leisurely through amongst the workmen, carrying some spare lamps with him to replace those which happen to be extinguished.

LAMPADARY, an officer in the ancient church of Constantinople, so called from his employment, which was to take care of the lamps, and to carry a taper before the emperor or patriarch when they went to church or in procession.

LAMPEDUSA, an island of the Mediterranean Sea, belonging to the kingdom of Naples. It stretches from east to west, and is thirteen miles and a half in circumference, with a level surface, except to the south-east, where it shelves from a height of 400 feet to a low shore, indented, or rather serrated, with many caves, of which the largest is called the harbour; and the island is entitled to notice, because it was proposed to retain this port at the time Bonaparte disputed our demand to retain possession of Malta after the peace of Amiens. It has few inhabitants, though an attempt was made to establish a colony during the late war, which has since been abandoned. The chief products are fire-wood and fish. It is ten miles from Tripoli, and seventy-five from Malta. The castle at the harbour is in longitude 12. 35. 10. east, and in latitude 35. 29. 19. north.

LAMPRIDIUS, ÆLIUS, one of the writers of the Augustan History, who lived at the beginning of the fourth century, during the reigns of Diocletian and Constantius, to whom he dedicates his work. The Augustan History is composed by six different authors, and contains a series of biographical sketches of the Roman emperors, from Hadrian to Carus and his sons (117–285, A. D.). These authors were, Ælius Spartianus, Vulcatius Gallicanus, Trebellius Pollio, Flavius Vopiscus, Ælius Lampridius, and Julius Capitolinus. Lampridius wrote the four lives of Commodus, Diadumenus, Heliogabalus, and Alexander Severus. He seems to have been more attentive to the accuracy of his facts than to the beauty of his style. It is supposed by Vossius (*De Hist. Lat.* ii. 7), and by Fabricius (*Biblioth. Lat.* iii. 6), that Lampridius and Spartianus are the same writer; but this opinion has been ably refuted by Demoulines. (See Moller, *Diss. de Æl. Lampridio*, Altorf, 1688; Casaubon, *ad. Spart. Adrian.*)

LAMPRIDIUS, *Benedict*, of Cremona, a Latin poet of the sixteenth century. He taught Greek and Latin at Rome and at Padua, until he was invited to Mantua by Frederick Gonzaga to undertake the tuition of his son. He wrote epigrams and lyric verses, both in Greek and Latin, which were printed separately, as well as amongst the *Deliciæ* of the Italian poets.

LAMPSACUS, or LAMPSACUM, in *Ancient Geography*, a considerable city of Mysia, more anciently called *Pityea*, because abounding in pine trees. It is situated at the north extremity or entrance of the Hellespont into the Propontis, with a commodious harbour opposite to Callipolis, in the Thracian Chersonesus. It is still called *Lampsacus*. Long. 28. E. Lat. 40. 12. N.

LAMPONG, a district of country in the southern extremity of the island of Sumatra, which begins on the west coast at the river Padanggoochie, and extends across the island as far as Palembang on the north-east side, at which place the settlers are mostly Javans. On the south and east sides it is washed by the sea, having several ports in the straits of Sunda, particularly Keyser's and Lampong Bays. It is intersected by the great river Sulangbawang, which rises from a considerable lake between the ranges of the mountains. The rivers overflow their banks in the rainy season; and the villages situated on the higher grounds appear like islands. The western parts are mountainous, and some of the peaks are visible at a considerable distance from the sea. The central and mountainous parts of the country are best inhabited, the people being secured from the inroads of their eastern neighbours the Javans. Of all the Sumatrans, the inhabitants of this district bear the strongest resemblance to the Chinese, particularly in their round faces, and the oblique direction of their eyes. Their women are esteemed fair and handsome, and an extraordinary degree of freedom is allowed between the sexes. They have been mostly converted from the Mahommedan religion, and there are mosques in almost all their villages; but their attachment to their old superstitions still leads them to regard with a peculiar veneration the burying-places of their fathers, which they piously adorn. Some of these inland people pay a kind of adoration to the sea, whose irresistible power is often felt on the coasts of India, and in the islands in the midst of these seas, on whose shores tremendous surfs, from the wide expanse of the Pacific Ocean, are constantly breaking, and rise frequently to the greatest height, without any apparent cause. The Dutch claim the dominion of the country; and towards the end of the eighteenth century an officer was sent to the bay of Lampong, from Batavia, to fix on a favourable situation for a fort, barracks, and storehouses. The bay of Lampong affords good anchorage, being wide and deep.

LANARK, the head burgh of the county of that name, is situated on an eminence half a mile from the Clyde, on its northern bank, at the distance of thirty-two miles west from Edinburgh, and twenty-five miles south-east from Glasgow. The derivation of the name has been the subject of much dispute, and is still involved in doubt. Lanark is one of the most ancient towns in Scotland. It appears to have been of considerable importance as early as the tenth century; for the first parliament ever held in Scotland was assembled here by Kenneth II. in 978; and at the royal castle of Lanark, the charter of William the Lion in favour of the town of Ayr was dated, in 1197. It was also the scene of the first military exploit of Sir William Wallace, who there slew the English governor for his cruelty and oppression, and in the neighbouring rocky fastnesses raised the standard of deliverance.

Lanark was originally erected into a royal burgh by Alexander I. There were several subsequent charters granted by other kings; but the last one, confirmatory of all the rest, was given by Charles I. in 1632.

Till the beginning of the present century, Lanark presented a mean and deserted appearance, and was said to be a "finished town;" but the rapid increase of the cotton manufacture at Glasgow, of the benefit of which Lanark reflectively enjoys a portion, has done much in reviving a spirit of improvement. The old houses are being rapidly modernised, and many new houses have been added. A branch of the Commercial Bank has been established, and a handsome house erected for the accommodation of their agent. A new jail and splendid county buildings have been erected, reading-rooms instituted, and many other indications of growing prosperity and wealth are manifested in a marked manner.

The staple occupation, previously to the introduction of the cotton manufacture, was the making of shoes and stockings; but latterly these manufactures have been mostly limited to the consumption of the district. About 700 persons are engaged in weaving, and about 100 in shoemaking.

Lanark, along with Hamilton, Airdrie, and Falkirk, sends one representative to parliament. The municipal government is vested in a provost, two bailies, and fourteen councillors.

The population of the burgh in 1794 was 2000, in 1831 it was 4266, and it must have increased considerably since that period. The population of the parish in 1831 was 7672.

Lanark, *New*, a manufacturing village, the most extensive for spinning cotton in Scotland. It is situated on the northern bank of the Clyde, a little below the celebrated falls, and about a mile distant from the town of Lanark. It was erected about the year 1785, by Mr David Dale, an enterprising and benevolent individual.

New Lanark afterwards came into the possession of Mr Robert Owen, son-in-law of its founder, who, by his exertions in the cause of education, brought the establishment into great notoriety. Mr Owen, in the prosecution of the grand object of his life, was, fortunately for his reputation as a philanthropist, early led to perceive the benefits to be derived from receiving infants into his educational institution; and thus originated that system which subsequently attracted so much attention. Messrs Walker and Company, the present proprietors, continue the infant school, and give gratis instruction to the more advanced children belonging to the village, in all the more useful branches of education; and the regulation adopted by Mr Owen, that no child under ten years of age, and who cannot read and write, and understand accounts, shall be received into the work, continues to be strictly enforced.

About fifteen years ago one of the mills was burned down; but in 1835 the proprietors rebuilt it on a greatly enlarged scale, and, it is said, are about to fit it up as a power-loom weaving factory. A gas-work has also been completed, on a scale sufficiently adequate to light up both the works and the village.

The population of New Lanark, about ten years ago, was 2260; but, according to the returns of 1831, the number was then reduced to 1901. It is now (1836) farther reduced to 1850 souls, of whom about 1100 are employed in the works. Owing to the improvements in machinery, more work is now performed by these than was done by 1500 or 1600, the number employed at the period of its greatest population. Besides, it is worthy of remark, as a greater triumph of machinery, that in the change thus effected, the number of men required has been greatly reduced, and their places occupied by women and boys.

The people of New Lanark are better informed, and their moral character and general deportment rank higher, than usually obtains amongst those of their class.

The situation of the village is low, but the cleanliness of its spacious and well-ventilated streets gives an idea of comfort exceedingly gratifying to the stranger, and must be highly conducive to health.

LANARKSHIRE, or Clydesdale, a county in Scotland, situated between 55. 20. and 55. 56. north latitude, and 3. 25. and 4. 22. west longitude. It is bounded on the north by the counties of Dumbarton and Stirling, on the east by those of Edinburgh, Linlithgow, and Peebles, by Dumfriesshire on the south, and by the counties of Ayr and Renfrew on the west. In length, from north to south, it is about forty-seven miles; its greatest breadth, from east to west, is thirty-two, and it extends over 942 square miles, or 602,880 English acres, of which about 271,000 acres are under cultivation. It is divided into three wards; the *Upper*, of which Lanark is the chief town, containing about two thirds of its area, on the east, south, and south-west, the greater part mountainous; the *Middle*, which has the town of Hamilton in its centre, stretching along the west and north; and the *Lower*, containing the city of Glasgow, and a small tract around it.

This extensive district presents great variety of surface. Some of the mountains in the Upper Ward, where it is bounded by Dumfriesshire, are about 3000 feet high; and Tintock, on the northern boundary of the hilly district, is nearly 2300. Leadhills, a village on its southern extremity, is 1564 feet above the level of the sea, being the highest inhabited ground in Scotland. But in proceeding along the banks of the Clyde north from Tintock, the face of the country softens down to gentle elevations and depressions, and for twelve miles the river winds slowly through fertile haughs. The Middle Ward is much less elevated, few of the heights being little more than 700 feet above sea level; the town of Hamilton is only about eighty; yet there are no plains of any extent except along the banks of the Clyde, and a considerable part of the surface is covered with moss, in many places to a great depth. Of the Lower, the greater part is a highly ornamented district, particularly the banks of the Clyde, which are thickly planted with villas, the summer residence of the wealthy inhabitants of the city of Glasgow.

The principal river, and, in a commercial point of view, the greatest in Scotland, is the Clyde, from which the county is frequently called *Clydesdale.* It has its rise in the ridge of mountains which separate Lanarkshire from Dumfriesshire, and, flowing first north and then north-west, through the middle of the county, falls into the frith of the same name above Greenock, carrying with it the waters collected from 1200 square miles. The principal streams which join it on the south are Duneaton, Douglas, Nethan, Avon, and West Calder; and on the north the Medwin, Mouse, South and North Calders, and Kelvin, which separates Lanarkshire from Dumbartonshire. The Clyde is navigable to Glasgow for vessels of more than 300 tons burden, and drawing thirteen feet water; and two miles higher up for smaller vessels. Most kinds of the fish found in the other rivers of Scotland are also found in the Clyde; but it is supposed that the great increase of trade on the river, and the use of the water for the various purposes of manufacture, have been injurious to the fisheries.

Sandstone and limestone are the prevailing rocks in the lower parts of Lanarkshire, and argillaceous schistus in the high grounds. In the Cathkin Hills, near Glasgow, there is a number of basaltic columns, more than forty feet high, inclined at an angle of about seventy degrees. Ironstone abounds in many parts of the county, and is wrought to a great extent, there having been nineteen furnaces in operation in 1835, producing 56,000 tons of iron annually, exclusive of six furnaces in preparation, calculated to make 13,000 tons additional, being more than three fourths of the whole quantity made in Scotland. The great increase in this manufacture has been partly attributed to the hot-blast invented by Mr Neilson of Glasgow, first tried on a large scale in the Clyde iron-works, and immediately thereafter adopted at the Calder works. The use of this improvement is rapidly extending, and is likely to effect a most beneficial change on the production of this valuable metal. On the southern extremity are the well-known lead-mines belonging to the Earl of Hopetoun, from which the village of Leadhills takes its name. These mines now yield annually only 700 tons of lead, being less than the half of the quantity produced during the war. This deficiency is attributed solely to the want of demand, the ore being still found in abundance. A manufactory of small shot was established about two years ago. In the same quarter gold was discovered in the time of James III., and afterwards collected in considerable quantities, from which the celebrated "bonnet pieces" of James V. were coined. But coal is by far the most important of its mineral treasures. It is supposed to stretch throughout an area of about 70,000 acres, and, including the different seams, to be about ten feet thick. The field near Glasgow contains eight seams, one of them seven feet thick, the whole amounting to upwards of thirty feet. There are several good seams of cannel or candle coal in different parts of the county. This kind has been long used by the country people for lighting their houses, and is now carried in great quantities to Glasgow and other towns, for the manufacture of gas.

The valued rent of Lanarkshire is L.162,118. 16s. 10d. Scots, and the real rent of lands, houses, mines, and quarries, is L.751,364. 1s. 2d. About two thirds of the county is the property of great landholders, but small properties are very numerous. The number of landholders above L.400 of valued rent is about seventy; and below that sum and above L.10, upwards of 750. These small estates, with those of many of the class immediately above them, are cultivated by their owners; the large ones are let out to tenants on leases, except the enclosed grass lands, a great part of which is let out from year to year for grazing only.

The arable land is for the most part divided into farms of a moderate extent, held on leases for nineteen years; but it is not an uncommon practice to let the grazing lands for two or three crops only, for which a high rent is often obtained. The sheep pastures in the mountain districts yield a rent averaging about two shillings and ninepence per acre, and the arable land about twenty shillings, the best in general being only cultivated. In the lower portion of the Upper Ward, where cultivation is more indiscriminate, the average is not much higher; but in the Middle and Lower Wards the average of arable land may be computed at thirty shillings. Much of the arable land in the first division is dry and fertile; clay prevails in the second and third; and along the banks of the Clyde there are considerable tracts of an alluvial description. Of late years much land has been reclaimed and improved by draining; and incalculable benefit has been derived from the planting of clumps and strips of trees in exposed situations, although this practice has not yet become so general as its importance obviously demands. The present system of entails, under which a great proportion of the land in this county is held, has been much blamed for retarding such improvements.

As this county slopes to the west almost throughout its whole extent, the Atlantic exerts a powerful influence on its climate. For about two thirds of the year the wind blows from the south-west and west. Intense frosts are of short duration, and snow seldom lies long in the lower districts; but, from the general humidity of the atmosphere, and also of the soil, seed-time and harvest are often late. In regard to heat, there is a considerable difference between the Upper and Middle Wards, the thermometer on the same day commonly standing several degrees higher in the latter than in the former. Its range is from eleven to eighty-five degrees. The quantity of rain that falls at Glasgow varies from fourteen and a half to twenty-eight and a half inches, the average for thirty years being twenty-two and a third; but at Lanark the influence of the Atlantic is less sensibly felt, owing probably to its open and elevated situation. This however may, equally with the great humidity of the other wards, account for the lateness of the harvest. Lanarkshire is therefore, upon the whole, less favourable to the culture of corn than the eastern counties of Scotland.

The dairy is accordingly an object of considerable importance here, and is carried on in all its branches. Besides the dairies kept in and near the city of Glasgow, for supplying the inhabitants with milk, cream, and fresh butter, a great number of cows are kept in the landward districts, the produce of which is applied to making butter and cheese, and the fattening of calves. The cheese is in general equal in quality to the best Dunlop, and brings the highest prices in the Edinburgh and Glasgow markets. Lesmahagow and Carnwath parishes are said to produce the best. Within the last few years several of the Highland Society's prizes for the best imitation of Stilton and double Gloucester cheeses have been obtained by the dairy farmers of the latter parish. The Ayrshire breed of cattle has hitherto been most prized; but a new species has recently been introduced, and found to be of superior quality, viz. the Lanarkshire newly-improved breed, crossed by the Ayrshire cow and short-horned bull, or *vice versa*. The draught-horses of Clydesdale have long been famous. They are supposed to have originated from some Flanders or Holstein horses brought over in the seventeenth century by one of the Dukes of Hamilton.

From the earliest period, Clydesdale has been celebrated for its fruit. The Venerable Bede, who flourished in the eighth century, speaks of the "apple-yards of Lanark" as being then famous. Till the beginning of the present century, however, the orchards seem to have been principally confined to sloping banks, and acclivities inaccessible to the plough. But the growing prosperity and wealth of Glasgow, and the obstructions to continental intercourse about the period above alluded to, operated a change so favourable, that some of the richest holm lands were speedily devoted to this species of cultivation. It is estimated that there are at least 600 acres in orchards, which are gradually extending, although the reduced value and the precariousness of the crop seem to hold out little inducement. The average value of the fruit at the orchards during the war was about L.8000 per annum, but of late years it has not exceeded L.5000. The average price of apples at the orchards in 1835 was under two shillings per sack of about forty pounds. Gooseberries and currants are likewise largely cultivated. In some of the more extensive orchards, they yield L.50 or L.60 annually.

The internal communication by means of roads is in a high state of improvement. The great line of road from Glasgow to Carlisle and London intersects the whole county from east to west; and in every direction it is traversed by roads in the best state of repair. But other modes of communication have been found requisite for the immense trade carried on in Glasgow and the neighbourhood. The navigation of the Clyde has been much improved by deepening and confining the bed of the river, and by canals formed in several directions. These are, the Forth and Clyde Canal, connecting the friths of these two rivers, thirty-five miles distant from each other; this was the first considerable work of the kind undertaken in Scotland, and has been a very useful and successful one; the shares of L.100 were lately selling at L.540: at Stockingfield, a collateral branch proceeds to Port Dundas, at Glasgow: the Monkland Canal, from the coal-works in the parishes of Monkland, to the Forth and Clyde at Port Dundas: and the Ardrossan Canal, which is completed from Port Eglinton, near Glasgow, to the village of Johnston, a distance of eleven miles, and is intended to be continued to Ardrossan, on the coast of Ayrshire, twenty-two miles farther. Railways, too, which promise to fulfil the wonders of the nursery tale of the seven-league boots, have been projected, and some of anbrynmair.

Lancashire.

them executed. The Kirkintilloch Railway stretches from the canal into the coalfields of Monkland. The Garnkirk Railway is the only one on which locomotive engines are employed. It extends from Glasgow to near Airdrie, where it is joined by the Ballochney Railway. The Wishaw and Coltness Railway, partly executed, is intended to open this mode of communication to near the centre of the county; whilst one on a more extensive scale is in contemplation for connecting the cities of Edinburgh and Glasgow. In short, railways, which seem as yet in their infancy, are now being pushed out in all directions from the great emporium of the west, and will no doubt thrive under the fostering enterprise and industry of that great city.

The city of Glasgow, with its manufactures and commerce, has been described in the article GLASGOW. The other towns are Lanark (see the article LANARK), Rutherglen, Hamilton, and Airdrie, with which may be classed the populous villages of Strathaven and Biggar, polling stations for the elections of members of parliament. Hamilton is situated on the Clyde, thirty-eight miles west of Edinburgh, and eleven south-east of Glasgow, with a population of 9513. In the neighbourhood is the seat of the Duke of Hamilton; and three miles below is Bothwell Bridge, noted for the defeat of the Covenanters, on the 22d of June 1679. Rutherglen is a royal burgh, on the Clyde, two and a half miles above Glasgow. Airdrie, situated in the parish of New Monkland, on the great road between Edinburgh and Glasgow, about ten miles from the latter, is rapidly rising into importance. It has been recognised as a burgh under the parliamentary and burgh reform acts. The population of the town in 1831 was 6594, of the parish 9867. There are a number of villages in the vicinity of Glasgow, which, by their situation, belong to that city; and several of considerable extent in different parts of the county. Amongst the latter may be mentioned Carnwath, Carluke, Douglas, Lesmahagow, Stonehouse, Leadhills, and New Lanark. The cotton manufacture, the iron-works, and the collieries, give employment to the greater part of the inhabitants of Lanarkshire. Every great establishment has a considerable village in the neighbourhood, where the workmen reside.

The county of Lanark sends one member to parliament, who is chosen by a constituency of 3634, of whom above 200 consist of the old freeholders. The city of Glasgow sends two members, chosen by a constituency of 8883; and the royal burghs of Lanark and Rutherglen, and the towns of Hamilton and Airdrie, have a share in the election of other two members; Lanark, Hamilton, and Airdrie, being joined with Falkirk, and Linlithgow and Rutherglen with Kilmarnock, Port Glasgow, Dumbarton, and Renfrew. It has one sheriff, whose jurisdiction extends over all the county, and three substitutes, at Lanark, Glasgow, and Hamilton. Lanarkshire contains forty-seven parishes, of which eleven belong to the Presbytery of Lanark, fourteen to that of Hamilton, and thirteen to that of Glasgow, all in the Synod of Glasgow and Ayr; and nine to the Presbytery of Biggar, in the Synod of Lothian and Tweeddale. The ecclesiastical revenue, exclusive of that of the churches within the city of Glasgow, including the estimated value of the glebes, may be stated, on an average of the last seven years, at about L.11,550. The increase of the population has been uncommonly rapid; but it may be attributed chiefly to the city of Glasgow, and the spread of its manufactures.

The following table exhibits an abstract of the population returns of 1831, and a comparative view of the enumerations made in 1801, 1811, 1821, and that year.

	OCCUPATIONS.			PERSONS.				AGRICULTURE.										
	Families chiefly employed in Agriculture.	Families chiefly employed in Trade, Manufactures, and Handicraft.	All other Families not comprised in the two preceding Classes.	Males.	Females.	Total of Persons.	Males 20 Years of Age.	Occupiers employing Labourers.	Occupiers not employing Labourers.	Labourers employed in Agriculture.	Employed in Manufacture, or in making Manufacturers' Machinery.	Employed in Retail Trade, or in Handicraft as Masters or Workmen.	Capitalists, Bankers, professional and other educated Men.	Labourers employed in Labour not Agricultural.	Other Males 20 Years of Age (except Servants).	Male Servants 20 Years of Age.	Male Servants under 20 Years.	Female Servants.

The population amounted in 1801 to 146,699, in 1811 to 191,752, in 1821 to 244,387, and in 1831 to 316,819.

(See Naismyth's *General View of the Agriculture of Clydesdale; Beauties of Scotland*, vol. iii.; *The General Report of Scotland;* and Playfair's *Account of Scotland*, vol. i.)

LANBRYNMAIR, a town in the hundred of Machynleth, in Montgomeryshire, in Wales, 193 miles from London. It is a sinecure rectory, in the patronage of the Bishop of St Asaph. The annual value of the real property was assessed in 1815 at L.5649. The population amounted in 1801 to 1743, in 1811 to 1657, and 1821 to 1893, and in 1831 to 2040.

LANCASHIRE, a great commercial and manfacturing county in the north-west of England. This district, which is situated between long. 2. 18. and 3. 7. W., and lat. 53. 23. and 54. 24. N., has Cumberland and Westmoreland on the north-east and north, Yorkshire on the east, Cheshire on the south, and the Irish Sea on the west. Its extreme length is about seventy-four miles, and its greatest breadth forty-four and a half; but the boundaries being very irregular, its outline is about 342 miles, which comprehends an area of 1765 square miles, or 1,129,600 acres. Lancashire forms part of the northern circuit, is situated within the province of York and diocese of Chester, and is divided into sixty-one parishes. The other divisions are hundreds, of which there are six, namely, Lonsdale on the north; Amounderness, Blackburn, and Leyland, in the middle; and Salford and West Derby on the south. Most of these are again popularly subdivided, according to their relative situation, or the names of their towns.

The greater part of this county, from Rossall Point on the north, to the Mersey on the south, except where it is indented by the estuary of the Ribble on the west, lies tolerably compact, in the form of an irregular square. To the north of Rossall Point, till it meets the county of Westmoreland, it is very narrow, with a sinuous boundary on all sides; and to the north-east there is a considerable tract called Furness, separated from the rest by extensive sands, where the river Ken, from Westmoreland, discharges itself into the Bay of Morecombe. Opposite the south point of Furness is the island of Walney, and other seven, of which the largest is Old Barrow. On the north-east and north much of the surface is occupied with hills and moors, particularly in Furness, where the highest grounds have the name of *Fells;* and also on the east, where it is bounded by Yorkshire; but the south and west quarters spread out for the most part into low and fertile tracts, though not without being interrupted by pretty large fields of moss. Chat Moss, near Worsley, and Pilling Moss, farther to the north, are the most extensive; but many other, though smaller, tracts occur in various parts. Along the coast there is also a considerable extent of sandy marsh land, particularly towards the north, near Lancaster and Warton, at the estuaries of the Leven and Duddon, in the north-east or Furness district, and about the banks of the island of Walney.

The climate of Lancashire is chiefly distinguished for its humidity. According to a register kept at Liverpool from 1784 to 1792, the least quantity of rain yearly was twenty-four and an eighth inches in 1788, and the greatest fifty-four and a fourth in 1792. At Lancaster, in the latter year, the quantity of rain was nearly sixty-six inches. Four inches have been known to fall in the course of a night. The mean heat at Lancaster, from 1784 to 1790, was 51° 8′. The prevailing winds are from the south, south-west, and north-east. As fogs are not frequent, nor the stagnant waters of any considerable extent, the climate is not insalubrious.

The soils of this extensive district are necessarily various. The higher grounds, covered with heath and broken with rocks, have a sterile moorish soil; but towards their base, and in the valleys which they form, it is for the most part of the nature of holme. Loam and clay of various degrees of consistence prevail on the flat grounds, with portions of sand, gravel, and moss; and on the banks of the rivers, and at their estuaries, there are large tracts of an alluvial description. The under stratum of the heathy grounds is sandstone or freestone of different colours; a blue rock, popularly called whinstone, is more common in the fell tracts of Furness. Limestone prevails on the north-west, and towards the eastern boundaries. This and the freestone rock occasionally come in contact with one another in a very remarkable manner, a striking instance of which occurs near the town of Chipping, at the termination of the high ridge of Longridge Fell. In some places towards the eastern border, coal approaches so near the surface, as to constitute the substratum of the soil, and may be seen cropping out at Townley Park, and on the rising grounds on both sides. Marl is frequently found below the soil in the low grounds, and also under the mosses. Much of the vale land consists of rich pastures and meadows; what part of it is under tillage is very productive, and in many instances of a quality to yield turnips and other green crops, as well as grain. A strong clayey loam, however, appears to be the predominant soil throughout the low grounds on the south and west, which, with the wetness of the climate, renders cultivation more difficult and hazardous than in many other districts.

The principal mineral substances are coal, copper, lead, and iron. The first, and in a manufacturing district by far the most important, of these, is in great abundance in several parts of the county. The great coal tract commences below Prescot on the south, and, crossing the county in a north-east direction, passes into Yorkshire; but coal abounds farther to the south-east, near Manchester, and also to the north above Lancaster. Its quality, as well as the thickness of the beds, and the depth at which it is wrought, has considerable diversity; but it is chiefly of a bituminous description. Cannel coal is found near Wigan, and at other places, and sometimes in contact with the black coal, or a little mixed with it, as at the pits near Layton Hall. Copper is met with in the rough barren mountains, towards the northern extremity of the high Furness or Fell district, particularly at Coniston, Muckle Gill, and Hartriggs; but has not been found to the south of Lancaster Sands in such quantities as to be wrought with advantage. Lead occurs towards the north and north-east parts of the county, but in no great quantity. Iron is wrought to the north of Lancaster Sands, in the liberty of Furness. Though found in other quarters, it is not in such abundance, so as to make the working of it profitable. In the northern part of the high Furness tract, quarries of blue slate have been opened. Sandstone is wrought in most parts of the county south of the Sands, and limestone, though it is found also in the Furness district, is most abundant on the Lancaster side. The main tracts of this rock are in the northern divisions above Lancaster, and near Chipping and Clitheroe, towards the borders of Yorkshire. More to the south, that is, throughout the larger and more valuable portion of the county, it occurs but seldom, and not to a great extent.

Lancashire is naturally well supplied with waters, of which its inhabitants have industriously availed themselves in their manufacturing establishments, and in facilitating the transport of their products of all kinds. The principal rivers are the Mersey, the Irwell, the Ribble, and the Loyne or Lune. The Mersey, after receiving the Etherow and the Goyt from Cheshire, and the Tame from Yorkshire, becomes a large river at the town of Stockport, and, after a winding course between this county and Cheshire, enters the Irish Sea a little below the town of Liverpool. By means of an artificial cut, it has been made navigable for vessels of sixty or seventy tons from Liverpool to the mouth of the Irwell, up which river the navigation is continued to Manchester.

The Irwell, which has its source amongst the hilly ranges to the south of Haslingden, also receives several streams, and flowing through a part of Manchester, where it is advantageously employed by the different manufactories, especially those of spinning, dyeing, and calico printing, falls into the Mersey a little below Flixton. The Ribble is a large river, which intersects the county from east to west. It enters Lancashire from Yorkshire, above the town of Clitheroe, and, flowing through the beautiful vale of Ribblesdale, joins the Irish Sea a little below the town of Preston, to which it is navigable for small vessels. The Loyne or Lune, also a large river, has its source in the fells of Westmoreland, and comes into Lancashire a little below Kirkby-Lonsdale, and, passing by the town of Lancaster, afterwards expands into a broad estuary, and empties itself into the Irish Sea, The Alt, the Douglas, the Wyer, the Winster, the Leven, the Crake, and the Dudden, are also considerable streams; and many others, though in a general description not worthy of notice for their size, afford the most important facilities to the manufactories established on their courses. There are several pieces of water in the county, known by the names of lakes, waters, meres, and tarns. Of these the most considerable is Coniston Lake or Thurston Water, and Esthwaite Water, both in Furness. With these may be mentioned the Lake of Windermere, which, though not properly belonging to Lancashire, enters it by its southern point, and forms its boundary for eight or ten miles. Mineral springs have been found at Cartmel, Flukeborough, Wigan, Latham House, near Ormskirk, and other places.

Of the canals by which a great part of this county is traversed in almost every direction, it would be difficult to give an intelligible description without references to a map, and the limits of this article admit only of noticing them very generally. The great importance of an interior communication by water had been recognised in this quarter a considerable time before any attempt was made to form one entirely artificial. The first object was to render some of the rivers navigable, as in the instance of the Mersey and Irwell, already mentioned, to effect which, acts of parliament were obtained in 1719 and 1720. But the droughts and tides which affect the navigation of these and other rivers have been found to occasion so much inconvenience, that more recently a preference has been given to channels of communication formed wholly by human labour. The first work of this description in Lancashire, and probably in England, was the Sankey Canal, from the Mersey to near St Helen's, which, including its branches, extends nearly twelve miles. It was finished about sixty years ago. Besides this canal, the county is intersected by nine others, four of which communicate with the populous town of Manchester. Of these we can only notice the more considerable. The Duke of Bridgewater's Canal, in as far as it belongs to Lancashire, commences in the suburbs of Manchester, and terminates at Pennington, near the town of Leigh. Under the town of Manchester a portion of it passes into arched tunnels, from one of which coals are hoisted up out of the barges below, through a shaft, and delivered into a large coal-yard in the main street. Before it reaches the coal-works at Worsley, it is carried under ground for three quarters of a mile. The Lancaster Canal commences at Kirkby-Kendal in Westmoreland, and terminates at West Houghton, to the eastward of Wigan, after a course of 75¾ miles. The principal object in executing this great work was to open a ready communication between the coal and limestone districts, and between the port of Lancaster and the populous towns on the north and south. It is on an average seven feet deep, and is navigable by boats of sixty tons burden. The Leeds and Liverpool Canal is of still greater length. It extends between the towns of Liverpool and Leeds, along a line of 107¾ miles, and communicating at the latter place with the Aire, which is navigable to the German Ocean, and at the former with the Mersey, which falls into the Irish Sea; the navigation is thus completed between the eastern and western seas. On this canal flats of forty-two tons are employed in the coal trade between Leeds and Wigan, and passage-boats are in constant use between these towns. The other canals, though works of great importance when each is considered by itself, are much inferior to those we have mentioned.

A considerable portion of the territory of this county belongs in property to his majesty, as Duke of Lancaster. The greater part of this consists of what is called *forest lands*, all of which are situated in the most northern parts. It is held in general on leases for thirty years, and yields but an inconsiderable revenue. A few other estates are also of considerable extent; but, generally speaking, landed property is much subdivided, and hence Lancashire has a greater number of land-owners than any other county in England, Middlesex excepted; many of the estates not affording a rental of L.200 a year, and not a few being below L.50.

Lancashire does not excel in its agriculture. Only about a fourth of its surface is computed to be under corn and other tillage crops, the other three fourths, subject to a deduction for wastes, roads, &c. being chiefly occupied in grazing and for the purposes of the dairy; and it has been estimated that it does not raise corn sufficient for the support of its population for more than three months in the year. All the different sorts of corn, however, are cultivated, and, where the soil is naturally fertile, the crops are often abundant; but turnips and other ameliorating crops are not in general use, nor always, where grown to some extent, properly attended to. Potatoes, however, are cultivated not only upon a large scale, but with great care and success; this root, with oatmeal, forming the principal food of the working classes. They were introduced into this county from Ireland, and are said to have been cultivated here long before they had found their way into most other parts of England. Lancashire was long noted for its breed of horned cattle, but a variety of other breeds have been introduced, particularly the Holderness, or short-horned, which are preferred to the Lancashire in the milk dairies near the town, and sometimes also in those at some distance, where the principal object is butter. The native breed is the kind more commonly kept for the cheese dairies, farther into the interior. A cow yields, upon an average throughout the year, from eight to twelve quarts of milk daily, or from four to six pounds of butter in the week, or from three to four hundredweight of cheese in the year. A considerable number of good horses are bred and reared, but its sheep stocks are inconsiderable, and seldom of a valuable description. Farms are in general small, and held either on short leases or without any lease at all, so that a tenant has no encouragement to invest capital in the improvement of the soil.

This district, however, is greatly distinguished by its manufactures and commerce, which afford employment to three fourths of its crowded population. Of the former, that of cotton, which is here conducted in all its branches on the most extensive scale, has long been the most considerable. The town of Manchester, where it seems to have had its origin in England, is still its principal seat, though several of the other towns, such as Preston, Garstang, Blackburn, Clitheroe, Middleton, Burnley, Wigan, Bury, Bolton, and Ashton, have a considerable share of it; and, indeed, it is more or less spread over the greater part of the county. At Ravenhead, near Prescot, plate-glass and mirrors are made to a considerable extent; brass, pewter, and copper works are carried on at Wigan and at St Helen's; Warrington has manufactures of sail-cloth, linens, and checks, with the making of pins and glass, and iron-founderies; and Rochdale and Ashton furnish a variety of the coarser articles of woollen.

From the great extent and variety of its manufactures, it is natural to infer that its commerce must be upon a scale proportionally extensive, and it is so. Liverpool, as a commercial town, is now perhaps second only to London; and to this rank it has attained from a very low beginning little more than a century ago. In prosperous times, the enterprise of its merchants exchanges the products of British capital and industry with those of almost every climate; and, at all times, it carries on an extensive commerce with America and the West Indies, and with Ireland; to which has been recently added a large share of the East India trade. The ports of Preston, Poulton, Warrington, Ulverston, and Lancaster, the county town, are chiefly employed in the coasting trade.

As a considerable portion of the people of Lancashire are employed in working up goods for a foreign market, the condition of the labouring classes, in particular, is much affected by the changes which occur from time to time in that market, and which it is not always possible to anticipate. They are sometimes in the receipt of wages more than sufficient for their comfortable subsistence, and at other times many are thrown out of employment altogether, and the rest retained at wages confessedly inadequate to their support. This is true in an especial manner of its great staple, the cotton manufacture. From this cause, and perhaps also owing to the inconsiderate habits and want of foresight which such fluctuations are apt to engender, the poor-rates of this county amounted, in 1815, to about L.400,000, whereas, forty years before, they were little more than L.50,000. Since that period up to the present time (1836), though the whole number of the inhabitants has increased nearly half a million, there has not been a corresponding increase on the assessments for the poor, but, on the contrary, a diminution, nor, except in the year 1832, has the amount quite reached that of 1815 and 1816.

The whole population of the county, at the three decennial enumerations, has been as follows:—In 1801, 672,731; in 1811, 828,309; in 1821, 1,052,859; and in 1831, 1,335,800; thus showing a doubling of the inhabitants in thirty years. The burials, including both the registered and unregistered, appear, between the years 1821 and 1833, to have been one in forty-five of the whole of the number then living. The illegitimate births bear a higher proportion to the whole births than in any other county of England, except Hereford and Shropshire, where, as in this county, they are one in thirteen, whereas in the whole of England they are only one in twenty.

According to the laborious production of Mr Rickman, the occupation of the people is thus described.

Occupiers of land employing labourers	6,658
Occupiers of land not employing labourers	9,714
Labourers employed in agriculture	20,949
Labourers employed in manufactures	97,517
Persons employed in retail trade or handicraft	86,076
Capitalists, bankers, &c	17,614
Labourers not agricultural	60,546
Other males twenty years of age	11.229
Male servants	3,825
Female servants	33,509

The largest towns in the county, and their population in 1831, were the following:

	Town.	Whole Parish.
Ashton-under-Lyne	9,222	33,597
Blackburn	27,091	59,791
Bolton	28,299	63,034
Bury	15,086	47,829
Lancaster	12,613	22,294
Liverpool	165,175	—
Manchester	142,026	270,961
Oldham	32,381	67,579
Preston	33,112	36,336
Rochdale, the town of that name, and a part of the parish, is in Yorkshire...	—	58,441
Toxteth Park, a suburb of Liverpool	24,067	—
Warrington	16,018	19,155
Wigan	20,774	44,486

By the law of 1832, called the reform bill, the borough of Newton, in this county, was disfranchised, and Clitheroe, which had two members, was reduced to one. By the same bill, the towns of Ashton, Bury, Rochdale, Salford, and Warrington, have been created boroughs, with the right of choosing one member each; and Manchester, Bolton, Blackburn, and Oldham, with the right of electing two each.

The county is formed into two divisions, for the purpose of elections. These are denominated the North, whose polling places are Lancaster, Hawkeshead, Ulverston, Poulton, Preston, and Burnley; and the South, whose polling places are, Newton, Wigan, Manchester, Liverpool, Ormskirk, and Rochdale.

LANCASTER, a town, the capital of the county of the same name, in the north of England, 239 miles from London. It is a sea-port, situated on the river Lune, along whose banks are some fine quays, on which are the warehouses of the several merchants and traders. The Lune is connected, by navigable canals, with the several rivers which run through England, by which great facilities are communicated for internal intercourse, and for dispersing the commodities which the trade of the town draws to it from America, the West Indies, and the Baltic. Lancaster is well built, and the streets properly paved. The church is a fine Gothic structure; and near to it is the castle, in which are the county jail, and the courts where the assizes are held. It is an ancient structure of the reign of Edward III.; on the top of it is a large square tower called John of Gaunt's chair, from which is a fine prospect over the surrounding country. The markets are held on Wednesday and Saturday, and are well supplied. This town is governed by a mayor, recorder, alderman, and bailiffs; and elects, as it did before the alteration, two members to the House of Commons. It formerly conferred the title of duke upon several members of the reigning family. The annual value of the real property, as assessed under the property-tax in 1815, amounted to L.34,117. The inhabitants amounted in 1801 to 9030, in 1811 to 9247, in 1821 to 10,144, and in 1831 to 12,613.

LANCAVY, or Pulo Lada, an island in the Eastern Seas, near the coast of Queda, about sixteen miles long, and from three to eight broad. Long. 96. 40. E. Lat. 6. 19. N.

LANCE, Lancea, a spear; an offensive weapon used by the ancient cavaliers, in form of a half pike. The lance consisted of three parts, the shaft or handle, the wings, and the dart. Pliny attributes the invention of lances to the Ætolians. But Varro and Aulus Gellius say the word lance is Spanish; and hence others conclude that the use of this weapon was borrowed by the people of Italy from the Spaniards. Diodorus Siculus derives it from the Gaulish, and Festus from the Greek λογχη, which signifies the same thing.

LANCET, a chirurgical instrument, sharp-pointed, two-edged, and chiefly used for opening veins in the operation of phlebotomy or bleeding; also for laying open abscesses, tumours, and the like.

LANCH, a peculiar sort of long boat, employed by the French, Spanish, and Italian shipping, and in general by those of other European nations, when voyaging in the Mediterranean Sea. A lanch is proportionally longer, lower, and more flat bottomed, than the long boat; it is consequently less fit for sailing, but better calculated for rowing, and approaching a flat shore. But its principal superiority over the long boat consists in being by its construction much fitter to under-run the cable; which is a very necessary employment in the harbours of the Levant, where the cables of different ships are fastened across each other, and frequently render this exercise extremely necessary.

Lanch, or Launch, is also the movement by which a ship or boat descends from the shore, either when she is at first built, or at any time afterwards. To facilitate the operation of launching, and prevent any interruption, the ship is supported by two strong platforms, laid with a gradual inclination to the water, on the opposite side of her keel, to which they are parallel. Upon the surface of this declivity are placed two corresponding ranks of planks, which compose the base of a frame called the *cradle*, the upper part of which envelopes the ship's bottom, to which it is securely attached. Thus the lower surface of the cradle, conforming exactly to that of the frame below, lies flat upon it lengthwise, under the opposite sides of the ship's bottom; and as the former is intended to slide downwards upon the latter, carrying the ship along with it, the planes or faces of both are well daubed over with soap and tallow. The necessary preparations for the launch being made, all the blocks and wedges by which the ship was formerly supported are driven out from under her keel, till her whole weight gradually subsides upon the platforms above described, which are accordingly called the *ways*. The shores and stanchions, by which she is retained upon the stocks till the period approaches for launching, are at length cut away, and the screws applied to move her if necessary. The motion usually begins on the instant when the shores are cut, and the ship slides downward along the ways, which are generally prolonged under the surface of the water, to a sufficient depth to float her as soon as she arrives at the farther extremity. When a ship is to be launched, the ensign, jack, and pendant are always hoisted, the last being displayed from a staff erected in the middle of the ship. Ships of the first rate are commonly constructed in dry docks, and afterwards floated out, by throwing open the flood-gates, and suffering the tide to enter as soon as they are finished.

LANCEROTA, one of the Canary Islands, situated at some distance from the western shore of Africa. It is subject to volcanoes; and one which occurred in 1730, spread desolation over a highly-cultivated region, entirely changing the face of the island. The eastern part is fertile, though sandy; and, stripped of its forests, Lancerota experiences, like the neighbouring continent, most excessive droughts. Camels are nevertheless maintained in great numbers; and corn, barley, and vegetables are exported. The vine grows with strength amongst the volcanic ashes. Teguisa is the name of the capital. This island possesses the two best ports of the archipelago; and it is much more advanced in civilization than those situated farther to the westward. The inhabitants lived in houses built of freestone, at a time when the Guanches of Teneriffe were lodged in caverns. Here is practised the singular custom likewise found in Thibet, of one woman being allowed to possess several husbands. The inhabitants of Lancerota may amount to about 10,000 in number, who export some corn, and a large quantity of dried goats' flesh; but they do not exhibit the commercial activity of those of Teneriffe. The island is about thirty miles in length by eighty in breadth.

LANCISI, John Marca, an eminent Italian physician, was born at Rome in 1654. From his earlier years he had a predilection for natural history, and studied botany, chemistry, anatomy, and medicine, with great assiduity. In 1688 Innocent XI. appointed him his physician and private chamberlain, notwithstanding his youth; and Cardinal Altieri Camerlinga made him vicar for the installation of doctors in physic, which Clement XI. gave him as long as he lived, at the same time continuing to him the appointments conferred on him by his predecessor. He died in 1710, after giving his fine library of more than twenty thousand volumes to the Hospital of the Holy Ghost for the use of the public. This noble benefaction was opened in 1716, in the presence of the pope and most of the cardinals. He wrote many works, which are esteemed, the principal of which were collected and printed at Geneva in 1718, in two vols. 4to.

LAND, in a general sense, denotes *terra firma*, as distinguished from *sea*.

Land, in a limited, sense, denotes arable ground.

Land, in nautical language, forms part of several compound terms. Thus, *land-laid*, or *to lay the land*, is just to lose sight of it. *Land-locked*, is when land lies all round the ship, so that no point of the compass is open to the sea. If the vessel is at anchor in such a place, she is said to ride *land-locked*, and is therefore concluded to ride safe from the violence of the winds and tides. *Land-mark*, is any mountain, rock, steeple, tree, or other object which may serve to make the land known at sea. The *land is shut in*, is a term used to signify that another point of land hinders the sight of that from which the ship came. *Land-to*, or the ship *lies land-to*, means she is so far from shore that it can only just be discerned. *Land turn*, is a wind that in almost all hot countries blows at certain times from the shore in the night. *To set the land*, is to see by the compass how it bears.

Land-Tax, one of the annual taxes raised upon the subject. See Taxation.

Land-Waiter, an officer of the custom-house, whose duty it is, upon the landing of any merchandise, to examine, taste, weigh, and measure them, and to take an account thereof. In some ports they also execute the office of a coast-waiter. They are likewise occasionally styled *searchers*, and are required to attend and join with the patent searcher in the execution of all cockets for the shipping of goods to be exported to foreign parts; and in cases where drawbacks on bounties are to be paid to the merchant on the exportation of any goods, they, as well as the patent searchers, are to certify the shipping thereof on the debentures.

LANDA, a town and territory of the island of Borneo, on the river Pontiana. It is the residence of the rajah, and is a strong place, well provided with artillery, and contains within its territory mines of considerable importance.

LANDAU, a canton of the province of the Rhine, in the kingdom of Bavaria. It is formed out of a portion of the former principality of Zwegbrucken, or Deux-Ponts, and is situated on the frontier of France, from which it is divided by the river Lauter. It is 558 square miles in extent, and contains eleven cities and market-towns, 126 villages, and 101,600 inhabitants. It is a mountainous and woody district, but with some rich and fertile valleys, yielding corn and cattle; but the chief produce is wood, which is floated down the Rhine, to the cities in Holland, in large rafts. The capital is the city of the same name, situated on the river Queich, one of the fortresses garrisoned by the German confederation. It is a regular and strong place, of four fronts, with eight curtains, defended by seven bastions, three redoubts, and seven lunettes, and surrounded with broad ditches. It has a citadel furnished with bomb-proof casernes and magazines, and celebrated for the sieges of 1702, 1704, 1713, and 1793. It contains 550 houses, and 4240 civil inhabitants. It has some manufactories of hemp, flax, and wool, and makers of twine, paper, hats, and hosiery. Long. 25. 47. E. Lat. 49. 11. N.

LANDEN, a town of the Netherlands, in the province of Liège and arrondissement of Huy, on the river Beake. It is remarkable for the battle fought near it, usually called the battle of Neerwinden, in 1693, in which the allies were defeated by Marshal Luxembourg. Long. 4. 55. E. Lat. 50. 45. N.

Landen, *John*, an eminent mathematician, was born at Peakirk, near Peterborough, in Northamptonshire, in January 1719. He early became a proficient in the mathematics, for we find him a respectable contributor to the *Ladies' Dairy* in 1744; and he was soon amongst the foremost of those who then contributed to the support of that small but valuable publication, in which a number of English mathematicians at one period or other contended for fame. Mr Landen continued his contributions to it under various signatures till within a few years of his death.

In the forty-eighth volume of the *Philosophical Transactions* for the year 1754, Mr Landen published an Investigation of some theorems which suggest several very remarkable properties of the circle, and are at the same time of considerable use in resolving fractions, the denominators of which are certain multinomials, into more simple ones, and by that means facilitate the computation of fluents. This paper was handed to the Society by Mr Thomas Simpson of Woolwich; a circumstance which will convey to those who are not themselves judges some idea of its merits. In the year 1755 he published a volume entitled *Mathematical Lucubrations*. It contains a variety of tracts relative to the rectification of curve lines, the summation of series, the finding of fluents, and many other points in the higher parts of the mathematics.

About the latter end of 1757, or the beginning of 1758, he published proposals for printing by subscription *The Residual Analysis*, a new branch of the algebraic art; and in 1758 he published a small tract in quarto, entitled *A Discourse on the Residual Analysis*, in which he resolved a variety of problems, to which the method of fluxions had been usually applied, by a mode of reasoning entirely new; compared these solutions with solutions of the same problems investigated by the fluxionary method; and showed that the solutions by his new method were, in general, more natural and elegant than the fluxionary ones. In the fifty-first volume of the *Philosophical Transactions* for the year 1760, he published a New Method of computing the sums of a great number of Infinite Series. This paper was also presented to the society by his ingenious friend Mr Thomas Simpson. In 1774 he published the first book of *The Residual Analysis*, in 4to, with several copperplates. In this treatise, besides explaining the principles on which his new analysis was founded, he applied it to drawing tangents and finding the properties of curve lines; to describing their involutes and evolutes, finding the radius of curvature, their greatest and least ordinates, and points of contrary fluxure; to the determination of their cusps, and the drawing of asymptotes;—and he proposed in a second book to extend the application of this new analysis to a great variety of mechanical and physical subjects. The papers which were to have formed this book lay long by him; but he never found leisure to put them in order for the press. In January 1766 Mr Landen was elected a fellow of the Royal Society, and admitted in the April following. In the fifty-eighth volume of the *Philosophical Transactions* for the year 1768, he published a specimen of a new method of comparing curvilineal areas, by means of which many areas are compared, that did not appear to be comparable by any other method; a circumstance of no small importance in that part of natural philosophy which relates to the doctrine of motion. In the sixtieth volume of the same work, for the year 1770, he gave some new theorems for computing the whole areas of curve lines, where the ordinates are expressed by fractions of a certain form, in a more concise and elegant manner than had been done by Cotes, Demoivre, and others, who had considered the subject before him. In the sixty-first volume, for 1771, he investigated several new and useful theorems for computing certain fluents, which are assignable by arcs of the conic sections. This subject had been considered before, both by Mr Maclaurin and M. d'Alembert; but some of the theorms which were given by these celebrated mathematicians, being in part expressed by the difference between an arc of a hyperbola and its tangent, and that difference being not directly attainable when the arc and its tangent both become infinite, as they will do when the whole fluent is wanted, although such fluent be finite; the theorems therefore fail in those cases, and the computation becomes impracticable without further help. This defect Mr Landen has removed by assigning the *limit* of the difference between the hyperbolic arc and its tangent, whilst the point of contact is supposed to be removed to an infinite distance from the vertex of the curve. And he concludes the paper with a curious and remarkable property relating to pendulous bodies, which is deducible from these theorems. In the same year he published an animadversion on Dr Stewart's computation of the Sun's distance from the Earth. In the sixty-fifth volume of the *Philosophical Transactions* for 1775, appeared the investigation of a general theorem, which he had promised in 1771, for finding the length of any arc of a conic hyperbola by means of two elliptic arcs; and by the theorems there investigated, both the elastic curve and the curve of equable recession from a given point may be constructed in those cases where Mr Maclaurin's elegant method fails. In the sixty-seventh volume, for 1777, he gave a new theory of the motion of bodies revolving about an axis in free space, when that motion is disturbed by some extraneous force, either percussive or accelerative. At this time he did not know that the subject had been handled by any other person; and he considered only the motion of a sphere's spheroid and cylinder. The publication of this paper, however, was the cause of his being told that the doctrine of rotatory motion had been considered by M. d'Alembert; and having purchased that author's *Opuscules Mathématiques*, he there learned that M. d'Alembert was not the only one who had considered the matter before him; for M. d'Alembert speaks of some mathematician, though he does not mention his name, who, after reading what had been written on the subject, doubted whether there existed any solid whatever, besides the sphere, in which a line, passing through its centre of gravity, would be a permanent axis of rotation. In consequence of this, Mr Landen took up the subject again; and though he did not then give a solution of the general problem, namely, to determine the motions of a body of any form whatever revolving without restraint about any axis passing through its centre of gravity, he fully removed every doubt of the kind which had been started by the person alluded to by M. d'Alembert, and pointed out several bodies, which, under certain dimensions, possess that remarkable property. This paper is published, amongst many others equally curious, in a volume of *Memoirs* which he gave to the world in 1780. But what renders that volume yet more valuable, is a very extensive Appendix, containing theorems for the calculation of fluents. The tables which contain these theorems are more complete and extensive than any which are to be found in other authors, and are chiefly of his own investigating; being such as had occurred to him in the course of a long and curious application to almost every branch of the mathematical sciences. In the years 1781, 1782, and 1783, he published three little tracts on the summation of converging series, in which he explained the extent of some theorems which had been given for that purpose by Demoivre, Mr Sterling, and Thomas Simpson, in answer to some things which he thought had been written to the disparagement of these mathematicians.

About the beginning of the year 1782 Mr Landen had made such improvements in his theory of rotatory motion, as he thought would enable him to give a solution of the general problem specified above; but finding the result to differ very materially from that of the solution which had been given by M. d'Alembert, and not being able to see clearly where that gentleman had erred, he did not venture to make his own public. In the course of that year having procured the Memoirs of the Berlin Academy for 1757, containing M. Euler's solution of the problem, he found that it gave the same result as had been deduced by M. d'Alembert; but the perspicuity of M. Euler's manner of writing enabled him to discover where he had erred, which the obscurity of the other did not do. The agreement, however, of two writers of such established reputation as M. Euler and M. d'Alembert made him long dubious of the truth of his own solution, and induced him to revise the process again and again with the utmost circumspection; but being every time more convinced that his own solution was right and theirs wrong, he at length gave it to the public in the seventy-fifth volume of the *Philosophical Transactions* for 1785.

The extreme difficulty of the subject, joined to the concise manner in which Mr Landen had been obliged to give his solution in order to confine it within proper limits for the Transactions, rendered it too difficult, or at least too laborious a piece of business, for most mathematicians to read it; and this circumstance, joined to the established reputation of Euler, induced many to think that his solution was right and Mr Landen's wrong, an opinion which attempts were made to establish by proof. But although these attempts were manifestly abortive, as every one who perused them saw, yet they convinced Mr Landen that there was a necessity for giving his solution at greater length, in order to render it more generally understood. About this time also he met by chance with Frisi's work on cosmography, physics, and mathematics, in the second part of which there is a solution of this problem, agreeing in the result with those of Euler and D'Alembert; which is not surprising, as Frisi employed the same principle that they did. Here Mr Landen learned that Euler had revised the solution which he had formerly inserted in the Berlin Memoirs, and given it in another form and at greater length in a volume published at Gryphiswald in 1765, entitled *Theoria Motus Corporum solidorum seu rigidorum.* Having procured this book, Mr Landen found the same principles employed in it, and of course the same conclusion resulting from them, which he had observed in Euler's former solution of the problems; but as the reasoning was given at greater length, he was enabled to see more distinctly how Euler had been led into the mistake, and to set that mistake in a stronger point of view. As he had been convinced of the necessity of explaining his idea on the subject more fully, he found it necessary to lose no time in setting about it. He had for several years been severely afflicted with calculus in the bladder, and towards the latter part of his life to such a degree as to be confined to his bed for more than a month at a time; yet even this dreadful disorder did not abate his ardour for mathematical studies, the second volume of his Memoirs having been written and revised during the intervals of his disorder. This volume, besides a solution of the general problem concerning rotatory motion, contains the resolution of the problem concerning the motion of a top; an investigation of the motion of the equinoxes, in which Mr Landen first pointed out the cause of Sir Isaac Newton's mistake in his solution of this celebrated problem; and some other papers of considerable importance. He lived to see this work finished, and received a copy of it the day before his death, which happened on the 15th of January 1790, at Milton, near Peterborough, in the seventy-first year of his age.

LANDERNAU, a city of France, in the department of Finisterre, and arrondissement of Brest. It stands on the river Ellhorn, and empties itself into a bay of the road of Brest. The harbour is good. The naval hospital, and various magazines for the equipment of the marine, are built here, and fill many large storehouses. It contains 3500 inhabitants, mostly depending on the navy. Long. 4. 23. W. Lat. 48. 25. N.

LANDES, Les, or the *Heaths*, a department of France, formed out of the district of Chalosse, a part of the ancient province of Gascony. It extends over 3810 square miles, or 900,534 hectares, of which more than two thirds are barren sandy heaths. It is situated between longitude 0. 3. and 1. 39. west, and between latitude 43. 29. and 44. 39. north. It is divided into three arrondissements, twenty-eight cantons, and 368 communes, and contains 260,000 inhabitants. It is by far the most miserable part of the kingdom. It is generally a level district, covered with heath, intermixed with swamps, in which, like the oases of Africa, a few spots are to be found with inhabitants, and only near to them can a little rye be grown. The rest exhibits only heaths, or firs, or cork trees. One district in the south-east, that of Chalosse, is an exception, being moderately fertile; but it is small as compared with the whole. The chief river is the Adour, which is navigable, and receives the waters of several smaller streams. On the sea shore are several lakes. Agriculture is in a backward state; and though rye is the chief corn, yet enough is not grown for the scanty population. The climate is not healthy, the heat in summer is scorching, and in winter it is mostly cold; but snow rarely falls, and never continues throughout the whole day. The chief products are wild fowl, river and sea fish, honey, wax, timber, cork, pitch, tar, and turpentine. The wine is only good in a small part, and in others the grapes are converted into brandy. Some mines of iron are worked, but not sufficient for the demand of the department. Two deputies are elected for the house of representatives. The capital is the city of Mont de Marsan.

LANDGRAVE (formed from the German *land*, earth, and *graff*, or *grave*, judge or count), a name formerly given to those who executed justice in behalf of the emperors, with regard to the internal policy of the country. The title does not seem to have been used before the eleventh century. These judges were first appointed within a certain district of Germany; but in process of time the title became hereditary, and they assumed the sovereignty of the several districts or counties over which they presided. Landgrave is now applied by way of eminence to those sovereign princes of the empire who possess by inheritance certain estates called *landgraviates*, and of which they receive the investiture from the emperor. There are four princes who have this title, viz. those of Thuringia, Hesse, Alsace, and Leuchtenberg. There are also other landgraves, who are not princes, but counts of the empire.

LANDGRAVIATE, or LANDGRAVATE, the office, authority, jurisdiction, or territory of a landgrave.

LANDGUARD, a fort in the county of Suffolk, on the north side of the rivers Orwell and Stour, which, with other forts at Harwich, on the opposite shore, defends the entrance of those rivers.

LANDRECY, a strongly-fortified city in the department of the North, and in the arrondissement of Avesnes, in France. It is situated on a level plain on the banks of the river Sambre, which is navigable thus far. It contains 462 houses, and 3500 inhabitants, some of whom are distillers of corn spirits, and some nailsmiths. Long. 3. 33. E. Lat. 50. 4. N.

LANDSBERG, a city of Prussia, the capital of the circle of the same name, in the province of Frankfort-on-the-Oder. It is situated on the river Wartha, is well built, and surrounded with walls. It contains 836 houses, with 9200 inhabitants, amongst whom are many Jews. There are many manufacturers of woollens, stockings, and hats, some paper-mills, and several breweries and distilleries. Long. 10. 32. E. Lat. 54. 15. N.

LANDSBERG, a town of East Prussia, in the government of Königsberg and circle of Xinten, on the river Stein. It contains a Catholic and a Lutheran church, 210 houses, and 1493 inhabitants, with some makers of cloths and hosiery. Long. 20. 32. E. Lat. 54. 13. N.

LANDSBERG, a city of Bavaria, in the province of the Isar, the capital of a bailiwick of the same name. It stands on the river Lech, is surrounded with walls, and contains 502 houses, with 3350 inhabitants. Its chief employment is in working saw-mills and oil-mills, and in making turnery ware. Long. 11. 8. 11. E. Lat. 48. 2. 50. N.

LANDSCAPE, in painting, the view or prospect of a country, extended as far as the eye will reach. See PAINTING.

LANDSCAPE *Gardening*. See GARDENING.

LANDSHUT, a town of the circle of Brun, in the Austrian province of Moravia. It stands at the junction of the river Taya with the March, and contains 257 houses, with 1473 inhabitants.

LANDSHUT, a city, the capital of the circle of the same name, in the government of Reichenbach, in Prussian Silesia. It stands on the river Bober, at its junction with the Zieder. It is fortified, contains two Catholic and one Lutheran church, 496 houses, and 3658 inhabitants. It is one of the great manufacturing places for Silesia linens.

LANDSHUT, a city of the province of the Isar, situated on that river, in the kingdom of Bavaria. It is in a picturesque situation, overlooked by an ancient castle on an eminence. It contains about 600 houses, and 8200 inhabitants. It is the seat of a university, in which are from 600 to 700 pupils, and which possesses a library of 100,000 volumes, and several appropriate institutions for instruction in law, medicine, surgery, midwifery, and the sciences. The trade is inconsiderable. Near it some wine is produced. Long. 12. 4. 26. E. Lat. 48. 5. 55. N.

LANDSKRON, a town of the circle of Chrudim, in the Austrian kingdom of Bohemia. It is the seat of Prince Lichtenstein, who has a magnificent palace. It contains 671 houses, and 2671 inhabitants, who are busily employed in manufactures, and produce cotton and linen goods; of the last, especially, some of the best damask table linen. It is celebrated for the bleaching of linen goods of all kinds.

LANDSKRONA, a city of Sweden, in the province of Malmoe. It is built on the Sound, on a tongue of land, which is protected by the Graen reef of rocks. It is strongly fortified, and protected by a citadel, and contains 400 houses, with 3776 inhabitants, who carry on a brisk trade in native and foreign commodities, and are owners of some large ships. Long. 12. 45. 41. E. Lat. 55. 52. 23. N.

LANESBOROUGH, a town of Ireland, in the county of Longford, pleasantly situated on the river Shannon, over which there is here a fine bridge. It has a handsome church, and a barrack for a troop of horse. It is situated sixty-two miles north-north-west from Dublin. Long. 8. 5. W. Lat. 52. 36. N.

LANFRANCO, GIOVANNI, an eminent Italian historical painter, born at Parma in 1581. He was first the disciple of Augustin, and, after his death, of Annibal Caracci, whose taste in design and colouring he so happily attained, that he was intrusted to execute some of his designs in the Farnese Palace at Rome. By order of Pope Urban VIII. he painted in St Peter's Church at Rome the representation of that saint walking on the water, which afforded the pope so much satisfaction that he knighted him. He died in 1647.

LANFRANCO, an Italian, born at Pavia, became archbishop of Canterbury in 1070. He disputed against Berengarius in the council held at Rome in 1059, and wrote against him concerning the real presence in the eucharist. He died in 1089.

LANGBAINE, DR GERARD, a learned English writer, was born in 1608. He was educated at Queen's College, Oxford, and became keeper of the archives of that university, and provost of his college. He was highly esteemed by Usher, Selden, and other learned men; and he died in 1657. He published an edition of Longinus, in Greek and Latin, with notes; and other works.

LANGBAINE, *Gerard*, the son of the former, was born in 1656. He was put as apprentice to Mr Symonds, bookseller in St Paul's Churchyard; but was soon afterwards called thence by his mother, upon the death of his eldest brother, and by her entered as a gentleman commoner of University College, Oxford, in 1672. Here he squandered a good part of his estate; but afterwards corrected his manner of living, and for some years lived in retirement near Oxford. During this time he improved his taste for dramatic poetry; and at first wrote some small pieces without his name, but afterwards published several works which he publicly owned. In 1690 he was elected inferior beadle of arts in the university of Oxford; and, in January following, was chosen superior beadle of law; but he died in 1692. He wrote, 1. The Hunter, a Discourse on Horsemanship; 2. A new Catalogue of English Plays, with their best editions, and divers remarks on the originals of most plays, and on the plagiarisms of several authors; 3. An Account of the English Dramatic Poets.

LANGELAND, an island in the Baltic Sea, a portion of the division of Funen, separated from it by a narrow strait, over which there is a ferry. It is about thirty miles in length and four miles and three fourths in medium breadth, and extends over 106 square miles, comprising one city or town, and fourteen parishes, with 12,300 inhabitants. It is merely an agricultural spot, of moderate fertility, yielding a surplus of about 14,000 quarters of corn beyond the consumption of the population. The capital is Rudkiobing, a place of 1200 inhabitants, situated in longitude 10. 42. E. and latitude 54. 55. N.

LANGENBERG, a town of Prussian Westphalia, in the government of Minden and circle of Reckenberg, containing 321 houses, and 1956 inhabitants.

LANGENBRUCKEN, a market-town of the duchy of Baden, in Germany, in the bailiwick of Brucksal, containing 190 houses, and 1275 inhabitants.

LANGENDIELAN, a very large straggling town in the government of Reichenbach, in Prussian Silesia, which extends to the frontier of Glatz. It contains 575 houses, with 6780 inhabitants. There are nearly 1000 looms at work on cloth and plushes.

LANGENSCHWALBACH, a city of the duchy of Nassau, in Germany, the capital of the bailiwick of that name. It is celebrated for its various medicinal springs, which are much resorted to in the summer, both for health and pleasure. The vicinity presents some most picturesque scenery and beautiful promenades, and every accommodation for visitors. It contains a Lutheran, Calvinist, and Catholic church, 260 houses, and 1640 resident inhabitants.

LANGENTHAL, a large market-town of the canton of Berne, in Switzerland. It is a manufacturing place for linen and cotton, and for silk and mixed silk goods, with considerable bleaching grounds and dye-houses. It stands on the river Langentann, whose waters move machinery.

LANGESALZA, a city, the capital of a circle of the same name, in the Prussian government of Erfurt. It stands on a gentle elevation above the river Salza, is fortified, and defended by a castle, and contains four churches, four hospitals, with 940 dwelling-houses, and 6840 inhabitants. It is the most considerable manufacturing city in the Prussian part of Thuringia, making goods of silk and linen, both cloth and hosiery, and having powerful mills for spinning cotton twist. It is also a place of great commerce in corn, and the other products of the fertile soil around it. Long. 10. 33. 25. E. Lat. 51. 6. 59. N.

LANGHEMARK, a market-town of the Netherlands, in the province of West Flanders, and arrondissement of Ypres, containing 540 houses, and 4600 inhabitants.

LANGHORNE, JOHN, an English poet and miscellaneous writer, was born at Kirkby-Steven, Westmoreland, in March 1735. He received the rudiments of his education, first at Winton, and afterwards at Appleby, where he early distinguished himself by his assiduity and proficiency. He left school in his eighteenth year, and, having no means of defraying the expense of an university education, engaged himself as private tutor to a family near Ripon. His next occupation was that of assistant in the free school of Wakefield, then superintended by Mr Clarke. Whilst in this situation he took deacon's orders, and, it is said, became a popular preacher. In the year 1759, Mr Clarke recommended him as preceptor to the sons of Mr Robert Cracroft of Hackthorn, near Lincoln, who were no fewer than nine in number. During his residence at Hackthorn, he published a volume of poems, which attracted but little notice; and he also wrote some critical pieces, which were rather more fortunate. In 1760, he entered his name at Clare-Hall, Cambridge, in order to take the degree of bachelor of divinity; but as his name does not appear in the list of the Cambridge graduates, it is more than probable that he did not succeed in his object. About this time he became enamoured of one of Mr Cracroft's daughters, and having met with a refusal from the young lady, immediately left his situation. In 1761, he officiated as curate at Dagenham, where he produced a great variety of pieces, some of which he published. His Letters on Religious Retirement were dedicated to Warburton, who returned him a complimentary acknowledgment, in which he advised Langhorne to make some attempt in the cause of religion. In 1764, having obtained the curacy and lectureship of St John's, Clerkenwell, he was enabled to reside in London, the great and ready mart for literary talents. About this time he engaged with Mr Griffiths as a writer in the *Monthly Review*, in which situation he continued until about the year 1769, when his connection with the Review is supposed to have ceased, in consequence of some dispute with the editor. His employment as a critic procured him the acquaintance of many literary men, whilst the vein of ridicule, which he occasionally indulged with more freedom than discretion, made him many enemies, amongst whom were Churchill, Kelly, and Kenrick, libellers by profession. In 1765, he produced a number of pieces, besides publishing an edition of the poems of Collins, with a memoir and critical notes. He replied to Churchill's Prophecy of Famine, a libel against the Scottish nation, in a poem entitled Genius and Valour, which obtained the approbation of Dr Robertson the historian, and procured for him the degree of doctor in divinity, which was conferred on him by the university of Edinburgh. In 1767, Dr Langhorne married Miss Cracroft, the lady to whom he had so long been attached, and with whom he had never ceased to correspond. But his happiness was of short duration, as Mrs Langhorne died in childbirth, on the 4th of March 1768. Not long after his wife's death, he went to reside at Folkestone, in Kent, where his brother officiated as perpetual curate. During his residence at this place, the brothers occupied themselves in preparing a new translation of Plutarch's Lives, which appeared in 1770, and soon became a very popular book. In the year 1772, Dr Langhorne paid a visit to his native country, where he married a second wife, the daughter of a magistrate near Brough, and then set out on a tour through part of France and the Netherlands, the scenery of which afforded new themes for his industrious muse. In 1776 he lost his second wife, who, like the former, died in childbed, leaving him a daughter. In 1777, at the request of the Bouverie family, by whom he was much respected, he was presented by the bishop, Dr Moss, with a prebend in the cathedral of Wells. But his career was now approaching its close. He died on the 1st of April 1779, in the forty-fifth year of his age. In 1804, his son published an edition of his poems in two vols. 12mo, with a memoir of the author, to which we beg to refer our readers for more ample details. Dr Langhorne was a man of an amiable disposition and inoffensive manners, social in his habits, and possessed of a considerable fund of wit, which he never abused or misapplied. The leading characteristics of his poetry are ease, fluency, and a considerable share of tenderness, without much invention or originality. His prose writings are sufficiently varied to satisfy us that he was a laborious and indefatigable writer. (A.)

LANGLAND, or Longlande, Robert, an old English poet, who flourished about 1350. He was a secular priest, and a fellow of Oriel College, Oxford. He is said to have been born in Shropshire. He wrote the Visions of Pierce Plowman, a piece which abounds with imagination and humour, though dressed to great disadvantage in very uncouth versification and obsolete language. It is written without rhyme, an ornament which the poet has endeavoured to supply by making every verse begin with the same letter. Dr Hickes observes, that this kind of alliterative versification was adopted by Langland from the practice of the Saxon poets, and that these Visions abound with Saxonisms; he styles him *celeberrimus ille satirographus, morum vindex acerrimus*. Several poets attempted imitations of his visions, and the learned Selden mentions him with honour.

LANGLEY, a town and parish in the hundred of Stoke, in the county of Buckingham, eighteen miles from London. The Grand Junction Canal passes by it, and, besides the trade from that circumstance, it has some in making lace and straw-hats. Near to it are several fine seats of noblemen and gentlemen. The population amounted in 1801 to 1215, in 1811 to 1571, in 1821 to 1616, and in 1831 to 1797.

LANGPORT, a market-town of the hundred of Pitney, in the county of Somerset, 131 miles from London. It stands at the junction of the river Ivell with the Paret, which latter is navigable to the port of Bridgewater, and by which coals, iron, and other heavy goods are dispersed over a great tract of country. The market is held on Saturday. It is an ancient borough, governed by a portreeve and bailiffs; but has not returned members to parliament, as it did in ancient times. It is situated in a fertile division of the county. The population amounted in 1801 to 754, in 1811 to 861, in 1821 to 1004, and in 1831 to 1245.

LANGREL Shot, at sea, that which consists of two bars of iron joined by a chain or shackel, with half a ball of iron fixed on each end; by means of which apparatus it does great execution amongst the enemy's rigging.

LANGRES, an arrondissement of the department of the Upper Marne, in France. It extends over 926 square miles, is divided into ten cantons, and these into 209 communes, containing 92,500 inhabitants. The capital is the city of the same name near the Marne, and 1370 feet above the level of the sea. It contains 1800 houses, and 6500 inhabitants, who are chiefly employed in making cutlery and other hardwares. Long. 5. 14. 45. E. Lat. 47. 51. 59. N.

LANGTON, Stephen, was born in England, but educated at Paris, and was greatly esteemed for his learning, both by the king and the nobility of France. He was chancellor of Paris, a cardinal of Rome, and in the reign of King John was made archbishop of Canterbury by Innocent III. in opposition both to the monks of Canterbury and to the king. Langton was one of the most illustrious men of his age for learning, and continued as archbishop for twenty-two years. He died in 1228.

LANGUAGE.

I.—ORIGIN OF LANGUAGE: REMARKS ON THE IDIOM AND GENIUS OF LANGUAGE.

Origin of Language.

LANGUAGE, in the proper sense of the term, signifies the expression of our ideas and their various relations by certain articulate sounds, which are used as the signs of those ideas and relations. By articulate sounds are meant those modulations of the voice, or of sound emitted from the thorax, which are formed by means of the mouth and its several organs, the teeth, the tongue, the lips, and the palate. In a more general sense, *language* is sometimes used to denote all sounds by which animals of any kind express their particular feelings and impulses in a manner that is intelligible to their own species.

Nature has endowed every animal with powers sufficient to make known those sensations and desires with which it is necessary, for the preservation of the individual or the continuance of the kind, that others of the same species should be acquainted. For this purpose, the organs of all vocal animals are so formed as, upon any particular impulse, to utter sounds, of which those of the same species instinctively know the meaning. The summons of the hen is instantly obeyed by the whole brood of chickens; and in many others of the irrational tribes a similar mode of communication may be observed between the parents and the offspring, and also between one animal and another. But it is not amongst animals of the same species only that these instinctive sounds are mutually understood. It is as necessary for animals to know the voices of their enemies as those of their friends; and the roaring of the lion is a sound of which, previously to all experience, every beast of the forest is naturally afraid. Between these animal voices and the language of men, however, there is very little analogy. Human language is capable of expressing ideas and notions, which there is every reason to believe that the mind of the brutes cannot conceive. "Speech," says Aristotle, "is made to indicate what is expedient and what inexpedient, and, in consequence of this, what is just and unjust. It is therefore given to men, because it is peculiar to them, that of good and evil, just and unjust, they only, with respect to other animals, possess a sense or feeling." The voices of brutes seem intended by nature to express, not distinct ideas or moral modes, but only such feelings as it is for the good of the species that they should have the power of making known; and in this, as in all other respects, these voices are analogous, not to speaking, but to weeping, laughing, singing, groaning, screaming, and other natural and audible expressions of passion or appetite. Another difference between the language of men and the voices of brute animals consists in articulation, by which the former may be resolved into distinct elementary sounds or syllables; whereas the latter, being for the most part inarticulate, are not capable of such a resolution. Hence Homer and Hesiod characterize man by the epithet μεροψ, or *voice-dividing*, as denoting a power peculiar to the human species; for though there are a few birds which utter sounds that may be divided into syllables, yet each of these birds utters but one such sound, which seems to be employed rather as a note of natural music than for the purpose of giving information to others; and hence, when the bird is agitated, it utters cries which are very different, and have no articulation.

A third difference between the language of men and the significant cries of brute animals, is, that the former is the product of art, the latter derived from nature. Every human language is learned by imitation, and is intelligible only to those who either inhabit the country where it is vernacular, or have been taught it by a master or by books. But the voices in question are not learned by imitation; and being wholly instinctive, they are intelligible to all the animals of that species by which they are uttered, though brought together from the most distant countries on earth. That a dog which had never heard another bark, would notwithstanding bark himself, and that the barkings or yelps of a Lapland dog would be instinctively understood by the dogs of Spain, Calabria, or any other country, are facts which do not admit of doubt. But there is no reason to imagine that a man who had never heard any language spoken would himself speak; and it is well known that the language spoken in one country is unintelligible to the natives of another country where a different language is spoken. Indeed it seems obvious, that were there any instinctive language, the first words uttered by all children would be the same; and that every child, whether born in the desert or in society, would understand the language of every other child, however educated or however neglected. Nay, more, we may venture to affirm that such a language, though its general use might, in society, be superseded by the prevailing dialect of art, could never be wholly lost; and that no man of one country would find it difficult, far less impossible, to communicate the knowledge of his natural and most pressing wants to the men of any other country, whether barbarous or civilized. The exercise of cultivated reason, and the arts of civil life, have indeed eradicated many of our original instincts, but they have not eradicated all.

There are external indications of the internal feelings and desires, which appear in the most polished society, and which are confessedly instinctive. The passions, emotions, sensations, and appetites, are naturally expressed in the countenance by characters which the savage and the courtier can read with equal readiness. The serene look, the smoothed brow, the dimpled smile, and the glistening eye, denote equanimity and good will, in terms which no man can mistake. The contracted brow, the glaring eye, the sullen gloom, and the threatening air, denote rage, indignation, and defiance, as plainly and forcibly as revilings or imprecations. To teach men to disguise these instinctive indications of their temper, and

> To carry smiles and sunshine in their face,
> When discontent sits heavy at their heart,

constitutes a great part of modern manners. Yet in spite of every effort of the utmost skill, and of every motive resulting from interest, the most consummate hypocrite, or the most hackneyed politician, is not always able to prevent his real disposition from becoming apparent in his countenance. He may indeed, by long practice, acquire a great command over his temper, and the instinctive signs of it; but at times nature will predominate over art, and a sudden and violent passion will flash in his face, so as to be visible to the eye of every beholder. If these observations be just, and we flatter ourselves that no man will call them in question, it seems to follow, that, if mankind were prompted by instinct to use articulate sounds as indications of their passions, affections, sensations, and ideas, the language of nature could never be wholly forgotten, and that it would sometimes predominate over the language of art. Groans, sighs, and some inarticulate lively sounds, are naturally expressive of pain and pleasure, and equally intelligible to all mankind. The occasional use of these no art can wholly banish; and if there were articulate sounds, naturally expressive of the same feelings, it is not conceivable that art or education could banish the use of them, merely because by the organs of the mouth they are broken into parts and resolvable into syllables.

It being thus evident that there is no instinctive articulated language, it has become an inquiry of some importance, how mankind were first induced to fabricate articulate sounds, and to employ them for the purpose of communicating their thoughts. Children learn to speak by insensible imitation; and when advanced some years in life, they study foreign languages under proper instructors. But the first men had no speakers to imitate, and no formed language to study. By what means, then, did they learn to speak? On this question only two opinions can possibly be formed. Either language must have been originally revealed from heaven, or it must be the fruit of human invention.

The latter opinion is strongly supported by Lord Monboddo, in his very learned and able work on the Origin and Progress of Language. But he candidly acknowledges, that if language was invented, it was of very difficult invention, and far beyond the reach of the grossest savages. Accordingly he holds, that though men were originally solitary animals, and had no natural propensity to the social life; yet, before language could be invented, they must have been associated for ages, and have carried on in concert some common work. Nay, he is decidedly of opinion, that before the invention of an art so difficult as language, men must not only have herded together, but also formed some kind of civil polity, existed in that political state a very long time, and acquired such powers of abstraction as to be able to form general ideas. But it is obvious, that men could not have instituted civil polity, or carried on in concert any common work, without communicating their designs to each other; and there are four ways by which the author thinks that this might have been done before the invention of speech, viz. 1st, *Inarticulate cries*, expressive of sentiments and passions; 2d, *Gestures*, and *the expression of countenance;* 3d, *Imitative sounds*, expressive of audible things; and, 4th, *Painting*, by which visible objects may be represented.

Of these four ways of communication, it is plain that only two have any connection with language, inarticulate cries and imitative sounds; and of these the author abandons the latter as having contributed nothing to the invention of articulation, though he thinks it may have helped to advance its progress. "I am disposed," says he, "to believe, that the framing of words with an analogy to the sound of the things expressed by them belongs rather to languages of art than to the first languages spoken by rude and barbarous nations." It is therefore inarticulate cries only that must have given rise to the formation of language. Such cries are used by all animals who have any use of voice, to express their wants; and the fact is, that all barbarous nations have cries expressing different things, such as joy, grief, terror, surprise, and the like. These, together with gestures and expressions of the countenance, were undoubtedly the methods of communication first used by men. We have but to suppose, says our author, a great number of our species carrying on some common business, and conversing together by signs and cries; and we have men just in a state proper for the invention of language. For if we suppose their numbers to have increased, their wants would also increase; and then these two methods of communication would become too confined for that larger sphere of life which their wants would make necessary. The only thing, then, that remained to be done, was to give a greater variety to the instinctive cries; and as the natural progress is from what is easy to what is more difficult, the first variation would be merely by tones from low to high, and from grave to acute. But this variety could not answer all the purposes of speech in society; and being advanced so far, it was natural that an animal so sagacious as man would go on farther, and come at last to the only other variation remaining, namely, articulation. The first articulation would be very simple, the voice being broken and distinguished only by a few vowels and consonants. And as all natural cries are from the throat and larynx, with little or no operation of the organs of the mouth, it is natural to suppose, that the first languages were for the greater part spoken from the throat; that what consonants were used to vary the cries, were mostly guttural; and that the organs of the mouth would at first be very little employed. From this account of the origin of language, it appears that the first sounds articulated were the natural cries by which men signified their wants and desires to one another, such as calling one another for certain purposes, and other such things as were most necessary for carrying on any joint work; then in process of time other cries would be articulated, to signify that such and such actions had been performed or were performing, or that such and such events had happened relative to the common business. The names of such objects as they were conversant with would be invented; but as we cannot suppose savages to be deep in abstraction or skilful in the art of arranging things according to their *genera* and *species*, all things, however similar, except perhaps the individuals of the lowest species, would be expressed by different words not related to each other either by derivation or composition. Thus would language grow by degrees; and as it grew, it would be more and more broken and articulated by consonants; but still the words would retain a great deal of their original nature of animal cries. And thus things would go on, words unrelated still multiplying, till at last the language would become too cumbersome for use, and then art would be obliged to interpose, and form a language upon a few radical words, according to the rules and method of etymology.

Those who think that language was originally revealed from heaven, consider this account of its human invention as a series of mere suppositions hanging loosely together, and the whole suspended from no fixed principle. The opinions of Diodorus, Vitruvius, Horace, Lucretius, and Cicero, which are frequently quoted in its support, are in their estimation of no greater authority than the opinions of other men; for as language was formed and brought to a great degree of perfection long before the era of any historian with whom we are acquainted, the antiquity of the Greek and Roman writers, who are comparatively of yesterday, gives them no advantage in this inquiry over the philosophers of France and England. Aristotle has defined man to be a ζωον μιμητικον, or imitative animal; and the definition is certainly so far just, that man is much more remarkable for imitation than invention; therefore, say the reasoners on this side of the question, had the human race been originally *mutum et turpe pecus*, they would have continued so to the end of time, unless they had been taught to speak by some superior intelligence. That the first men sprung from the earth like vegetables, no modern philosopher has ventured to assert; nor does there anywhere appear sufficient evidence that men were originally in the state of savages. The oldest book extant contains the only rational cosmogony known to the ancient nations; and that book represents the first human inhabitants of this earth, not only as reasoning and speaking animals, but also as in a state of high perfection and happiness, of which they were deprived for disobedience to their Creator. Moses, setting aside his claim to inspiration, deserves, from the consistency of his narrative, at least as much credit as Moschus, or Democritus, or Epicurus; and from his prior antiquity, if antiquity could on this subject have any weight, he would deserve more, as having lived nearer to the period of which they all write. But the question respecting the origin of language may be decided without resting on authority of any kind, merely by considering the nature of speech, and the mental and corporeal powers of man. Those who maintain it to be of human invention, suppose men at first to have been solitary animals, afterwards to have herded together without government or subordination, then to have formed political societies, and by their own exertions to have advanced from the grossest ignorance to the refinements of science. But, say the reasoners whose cause we are now pleading, this is a supposition contrary to all history and all experience. There is not upon record a single instance well authenticated of a people emerging by their own efforts from barbarism to civilization. There have indeed been many nations raised from the state of savages; but it is known that they were polished, not by their own repeated exertions, but by the influence of individuals or colonies from nations more enlightened than themselves. The original savages of Greece were tamed by the Pelasgi, a foreign tribe; and were afterwards further polished by Orpheus, Cecrops, Cadmus, and others, who derived their knowledge from Egypt and the East. The ancient Romans, a ferocious and motley crew, received the blessings of law and religion from a succession of foreign kings; and the conquests of Rome at a later period contributed to civilize the rest of Europe. In America, the only two nations which at the invasion of the Spaniards could be said to have advanced a single step from barbarism, were indebted for their superiority over the other tribes, not to the gradual and unassisted progress of the human mind, but to the wise institutions of foreign legislators.

This is not the proper place for tracing the progress of man from the savage state to that of political society; but experience teaches us, that in every art it is much easier to improve than to invent? The human mind, when put into the proper track, is indeed capable of making great advances in arts and sciences; but if any credit be due to the records of history, it has not, in a people sunk in ignorance and barbarity, sufficient vigour to discover that track, or to conceive a state different from the present. If the rudest inhabitants of America and other countries have continued, as there is every reason to believe they have continued, for ages in the same unvaried state of barbarism; how is it imaginable that people so much ruder than they, as to be ignorant of all language, should think of inventing an art so difficult as that of speech, or even to frame a conception of the thing. In building, fishing, hunting, navigating, and the like, they might imitate the instinctive arts of other animals, but there is no other animal that expresses its sensations and affections by arbitrary articulate sounds. It is said, that before language could be invented, mankind must have existed for ages in large political societies, and have carried on in concert some common work; but if inarticulate cries, and the natural visible signs of the passions and affections, were modes of communication sufficiently accurate to keep a large society together for ages, and to direct its members in the execution of some common work, what could be their inducement to the invention of an art so useful and difficult as that of language?

Let us however suppose, say the advocates for the cause which we are now supporting, that different nations of savages set about inventing an art of communicating their thoughts, which experience had taught them was not absolutely necessary; how came they all, without exception, to think of the one art of articulating the voice for this purpose? Inarticulate cries, out of which language is fabricated, have indeed an instinctive connection with our passions and affections; but there are gestures and expressions of countenance with which our passions and affections are in the same manner connected. If the natural cries of passion could be so modified and enlarged as to be capable of communicating to the hearer every idea in the mind of the speaker, it is certain that the natural gestures could be so modified as to answer the very same purpose (see PANTOMIME); and it is strange that, among the several nations who invented languages, not one should have stumbled upon fabricating visible signs of their ideas, but that all should have agreed to denote them by articulated sounds. Every nation whose language is narrow and rude supplies its defects by a violent gesticulation; and therefore, as much less genius is exerted in the improvement of any art than was requisite for its first invention, it is natural to suppose that, had men been left to devise for themselves a method of communicating their thoughts, they would not have attempted any other than that by which they now improve the language transmitted by their fathers. It is vain to urge that articulate sounds are fitter for the purpose of communicating thought than visible gesticulation; for though this may be true, it is a truth which could hardly occur to savages, who had never experienced the fitness of either; and if, to counterbalance the superior fitness of articulation, its extreme difficulty be taken into view, it must appear little less than miraculous that every savage tribe should think of it rather than the easier method of artificial gesticulation. Savages, it is well known, are remarkable for their indolence, and for always preferring ease to utility; but their modes of life give such pliancy to their bodies, that they could with very little trouble bend their limbs and members into any positions agreed upon as the signs of ideas. This is so far from being the case with respect to the organs of articulation, that it is with extreme difficulty, if at all, that a man advanced in life can be taught to articulate any sound which he has not been accustomed to hear. No foreigner who comes to England after the age of thirty ever pronounces the language tolerably well; an Englishman of that age can hardly be taught to utter the guttural sound which a Scotchman gives to the Greek χ, or even the French sound of the vowel u; and of the solitary savages who have been caught in different forests, we know not that there has been one who, after the age of manhood, learned to articulate any language so as to make himself readily understood. The present age has indeed furnished many instances of deaf persons being taught to speak intelligibly by skilful masters moulding the organs of the mouth into the positions proper for articulating the voice; but who was to perform this task amongst the inventors of language, when all mankind were equally ignorant of the means by which articulation is effected? In a word, daily experience informs us, that men who have not learned to articulate in their childhood, never afterwards acquire the faculty of speech but by such helps as savages cannot obtain; and therefore, if speech was invented at all, it must have been either by children who were incapable of invention, or by men who were incapable of speech. A thousand, nay, a million, of children could not think of inventing a language. While the organs are pliable, there is not understanding enough to frame the conception of a language; and by the time that there is understanding, the organs are become too stiff for the task, and therefore, say the advocates for the divine origin of language, reason as well as history intimates, that mankind in all ages must have been speaking animals; the young having constantly acquired this art by imitating those who were older; and we may warrantably conclude, that our first parents received it by immediate inspiration.

To this account of the origin of language an objection readily offers itself. If the first language was communicated by inspiration, it must have been perfect, and held in reverence by those who spake it, in other words, by all mankind. But a vast variety of languages have prevailed in the world; and some of these which remain are known to be very imperfect, whilst there is reason to believe that many others are lost. If different languages were originally invented by different nations, all this would naturally follow from the mixture of these nations; but what could induce men possessed of one perfect language of divine original, to forsake it for barbarous jargons of their own invention, and in every respect inferior to that with which their forefathers or themselves had been inspired?

In answer to this objection, it is said, that nothing was given by inspiration but the faculty of speech and the elements of language; for when once men had language, it is easy to conceive how they might have modified it by their natural powers, as thousands can improve what they could not invent. The first language, if given by inspiration, must in its principles have had all the perfection of which language is susceptible; but from the nature of things it could not possibly be very copious. The words of language are either proper names or the signs of ideas and relations; but it cannot be supposed that the All-wise Instructor would load the memories of men with words to denote things then unknown, or with the signs of ideas which they had not then acquired. It was sufficient that a foundation was laid of such a nature as would support the largest superstructure which they might ever after have occasion to raise upon it, and that they were taught the method of building by composition and derivation. This would long preserve the language radically the same, though it could not prevent the introduction of different dialects in the different countries over which men spread themselves. In whatever region we suppose the human race to have been originally placed, the increase of their numbers would in process of time either disperse them into different nations, or extend the one nation to a vast distance on all sides from what we may call the seat of government. In either case they would everywhere meet with new objects, which would occasion the invention of new names; and as the difference of climate and other natural causes would compel those who removed eastward or northward to adopt modes of life in many respects different from the modes of those who travelled towards the west or the south, a vast number of words would in one country be fabricated to denote complex conceptions, which must necessarily be unintelligible to the body of the people inhabiting countries where those conceptions had never been formed. Thus would various dialects be unavoidably introduced into the original language, even whilst all mankind remained in one society and under one government. But after separate and independent societies were formed, these variations would become more numerous, and the several dialects would deviate farther and farther from each other, as well as from the idiom and genius of the parent tongue, in proportion to the distance of the tribes by whom they were spoken.

If we suppose a few people either to have been banished together from the society of their brethren, or to have wandered of their own accord to a distance, from which through trackless forests they could not return (and such emigrations have often taken place), it is easy to see how the most copious language must in their mouths have soon become narrow, and how the offspring of inspiration must have in time become so deformed as hardly to retain a feature of the ancestor whence it originally sprung. Men do not long retain a practical skill in those arts which they never exercise; and there are abundance of facts to prove, that a single man cast upon a desert island, and having to provide the necessaries of life by his own ingenuity, would soon lose the art of speaking with fluency his mother tongue. A small number of men cast away together, would indeed retain that art somewhat longer; but in a space of time not very long, it would in a great measure be lost by them or their posterity. In this state of banishment, as their time would be almost wholly occupied in hunting, fishing, and other means within their reach to support a wretched existence, they would have very little leisure, and perhaps less desire, to preserve by conversation the remembrance of that ease and those comforts of which they now found themselves for ever deprived: and they would of course soon forget all the words which in their native language had been used to denote the accommodations and elegancies of polished life. This at least seems to be certain, that they would not attempt to teach their children a part of language which in their circumstances could be of no use to them, and of which it would be impossible to make them comprehend the meaning; for where there are no ideas, the signs of ideas cannot be made intelligible. From such colonies as this, dispersed over the earth, it is probable that all those nations of savages have arisen, which have induced so many philosophers to imagine that the state of the savage was the original state of man; and if so, we see that from the language of inspiration must have unavoidably sprung a number of different dialects all extremely rude and narrow, and retaining nothing of the parent tongue, except perhaps the names of the most conspicuous objects of nature, and of those wants and enjoyments which are inseparable from humanity. The savage state has no artificial wants, and furnishes few ideas that require *terms* to express them. The habits of solitude and silence incline a savage rarely to speak; and when he speaks, he uses the same terms to denote different ideas. Speech therefore, in this rude condition of men, must be extremely narrow and extremely various. Every new region, and every new climate, suggests different ideas and creates different wants, which must be expressed either by terms entirely new, or by old terms used with a new signification. Hence must originate great diversity, even in the first elements of speech, among all savage nations, the words retained of the original language being used in various senses, and pronounced, as we may believe, with various accents.

When any of those savage tribes emerged from their barbarism, whether by their own efforts or by the aid of people more enlightened than themselves, it is obvious that the improvement and copiousness of their language would keep pace with their own progress in knowledge and in the arts of civil life; but in the infinite multitude of words which civilization and refinement add to language, it would be little less than miraculous were any two nations to agree upon the same sounds to represent the same ideas. Superior refinement, indeed, may induce imitation, conquests may impose a language, and extension of empires may melt down different nations and different dialects into one mass; but independent tribes naturally give rise to diversity of tongues, nor does it seem possible that they should retain more of the original language than the words expressive of those objects with which all men are at all times equally concerned. The variety of tongues, therefore, the copiousness of some, and the narrowness of others, furnish no good objection to the divine origin of language in general; for, whether language was at first revealed from heaven, or in a course of ages invented by men, a multitude of dialects would inevitably arise as soon as the human race had separated into a number of distinct and independent nations.[1]

---

[1] In the foregoing view of this subject, the argument for the supernatural origin of language is evidently that which the author wishes to favour. But though we have, with some slight alterations, reprinted this part of the article, which was written for

Idiom and genius of language.

As the knowledge of languages constitutes a great part of erudition, as their beauties and deformities furnish employment to taste, and as these depend much upon the idioms of the different tongues, we shall proceed to make a few remarks upon the advantages and defects of some of those idioms of language with which we are best acquainted. As the words *idiom* and *genius* of a language are often confounded, it will be necessary to inform the reader, that by *idiom* we would here be understood to mean that general mode of arranging words into sentences which prevails in any particular language; and by the *genius* of a language, we mean to express the particular set of ideas which the words of any language, either from their formation or multiplicity, are most naturally apt to excite in the mind of any one who hears it properly uttered. Thus, although the English, French, Italian, and Spanish languages nearly agree in the same general *idiom*, yet the particular *genius* of each is remarkably different. The English is naturally bold, nervous, and strongly articulated; the French is weaker, and more flowing; the Italian more soothing and harmonious; and the Spanish more grave, sonorous, and stately. Now, when we examine the several languages which have been most esteemed in Europe, we find that there are only two *idioms* among them which are essentially distinguished from one another; and all those languages are divided between these two idioms, following sometimes the one and sometimes the other, either wholly or in part. The languages which may be said to adhere to the first *idiom*, are those which in their construction follow the order of nature; that is, express their ideas in the natural order in which they occur to the mind; the subject which occasions the action appearing first; then the action accompanied with its several modifications; and, last of all, the object to which it has reference. These may properly be called *analogous* languages; and of this kind are the English, French, and most of the modern languages in Europe. The languages which may be referred to the other *idiom*, are those which follow no other order in their construction than what the taste or fancy of the composer may suggest; sometimes making the object, sometimes the action, and sometimes the modification of the action, to precede or follow the other parts. The confusion which this might occasion is avoided by the particular manner of *inflecting* their words, by which they are made to refer to the others with which they ought to be connected, in whatever part of the sentence they occur, the mind being left at liberty to connect the several parts with one another after the whole sentence is concluded; and as the words may be here transposed at pleasure, those languages may be called *transpositive* languages. To this class we must, in an especial manner, refer the Latin and Greek languages. As each of these *idioms* has several advantages and defects peculiar to itself, we shall endeavour to point out the most considerable of them, in order to ascertain with greater precision the particular character and excellence of some of those languages now principally spoken or studied in Europe.

The partiality which our forefathers, at the revival of letters in Europe, naturally entertained for the Greek and Roman languages, made them look upon every distinguishing peculiarity belonging to them as *one* of the *many* causes of the amazing superiority which those languages evidently enjoyed above every other at that time spoken in Europe. This blind deference still continues to be paid to them, as our minds are early prepossessed with these ideas, and as we are taught in our earliest infancy to believe, that to entertain the least idea of our own language being equal to the Greek or Latin in any particular whatever, would be a certain mark of ignorance or want of taste. Their rights, therefore, like those of the church in former ages, remain still to be examined; and we, without exerting our reason to discover truth from falsehood, tamely sit down satisfied with the idea of their undoubted pre-eminence in every respect. But if we look around us for a moment, and observe the many excellent productions which are to be met with in almost every language of Europe, we must be satisfied that *even these* are now possessed of *some* powers which might afford at least a presumption, that if they were cultivated with a proper degree of attention, they might, in *some respects*, be made to rival, if not to excel, those beautiful and justly admired remains of antiquity. Without endeavouring to derogate from their merit, let us, with the cool eye of philosophic reasoning, endeavour to bring before the sacred tribunal of truth some of those opinions which have been most generally received upon this subject, and rest the determination of the cause on her impartial decision.

The learned reader well knows, that the several changes which take place in the arrangement of the words in every *transpositive* language, could not be admitted without occasioning great confusion, unless certain classes of words were endowed with particular variations, by means of which they might be made to refer to the other words with which they ought naturally to be connected. From this cause proceeds the necessity of several variations of *verbs*, *nouns*, and *adjectives*; which are not in the least essential or necessary in the *analogous* languages, as we have pretty fully explained under the article GRAMMAR, to which we refer for satisfaction on this head. We shall in this place consider, whether these variations are an advantage or a disadvantage to language.

As it is generally supposed that every language the verbs of which admit of *inflection*, is on that account much more perfect than one where they are varied by *auxiliaries*, we shall, in the first place, examine this with some degree of

---

the earlier editions of this work, we are far from adopting the very unphilosophical opinion which it supports. We do not assert, because we could have nothing like evidence for such an assertion, that the Deity did not originally bestow on man the gift of speech; but we think, with Lord Monboddo, and many others, that if such a boon ever was conferred, it must, in the revolutions and calamities that have befallen the human race, inevitably have been lost; and therefore, that as multitudes of languages exist and have ever existed, the art of speech is one which man is capable of attaining to, independently of any supernatural aid. This is the view taken by our best philosophers. Thus, Mr Stewart, notwithstanding his well-known caution in forming conclusions on momentous subjects, unhesitatingly avows his conviction, that "the human faculties are competent to the formation of language." (*Philosophy of the Mind*, vol. iii. chap. 1.) In another place, the same admirable writer makes the following philosophical observations on this subject:—"The steps in the formation of language cannot probably be determined with certainty; yet if we can show, from the known principles of human nature, how the various parts may naturally have arisen, the mind is not only to a certain degree satisfied, but a check is given to that indolent philosophy which refers to a miracle whatever appearances, either in the natural or moral world, it is unable to explain." One of the most ingenious attempts that ever has been made to show by what steps the human mind would naturally proceed in the acquisition of speech, is that contained in Dr Adam Smith's "Considerations on the Formation of Languages." His theory may perhaps be liable to objection in some of its details; but it is developed with singular clearness and simplicity; and it must, in its general scope and design, be allowed by all candid and competent judges to be eminently philosophical. This essay was annexed by its author to the first edition of his *Theory of Moral Sentiments*; and we are told by Mr Stewart, that he always regarded it with great partiality, and that he reprinted it, without a single alteration, in the last edition of that work which he himself revised. Mr Stewart's commentary upon it (*Philosophy of the Mind*, ubi supra) ought to be perused alongst with it.

attention; and, that what is said on this head may be the more intelligible, we shall give examples from the Latin and English languages. We make choice of these languages, because the Latin is more purely *transpositive* than the Greek, and the English admits of less *inflection* than any other language that we are acquainted with.

If any preference be due to a language from the one or the other method of *conjugating* verbs, it must in a great measure be owing to one or more of these three causes: Either it must admit of a greater variety of sounds, and consequently afford more scope for harmonious diversity of tones in the language; or a greater freedom of expression is allowed in uttering any simple idea, by the one admitting of a greater variety in the arrangement of the words which are necessary to express that idea than the other does; or, lastly, a greater precision and accuracy in fixing the meaning of the person who uses the language, arise from the use of one of these forms rather than from the use of the other. For, as every other circumstance which may serve to give a diversity to language, such as the general and most prevalent sounds, the frequent repetition of any one particular letter, and a variety of other circumstances of that nature, which may serve to debase a particular language, are not influenced in the least by the different methods of varying the verbs, they cannot be here considered. We shall therefore proceed to make a comparison of the advantages or disadvantages which may accrue to a language by inflecting its verbs, with regard to variety of sound, variety of arrangement, and accuracy of meaning.

The *first* particular that we have to examine is, whether the one method of expressing the variations of a verb admits of a greater variety of sounds. In this respect the Latin seems, at first view, to have a great advantage over the English; since the words *amo*, *amabam*, *amaveram*, *amavero*, *amem*, &c. seem to be more different from one another than the English translations of these, *I love*, *I was loving*, *I had loved*, *I shall have loved*, *I may love*, &c.: for although the syllable AM is repeated in every one of the first, yet, as the last syllable usually strikes the ear with greater force, and leaves a greater impression, than the first, it is very probable that many will think the frequent repetition of the word LOVE, in the last instance, more striking to the ear than the repetition of AM in the former. We will therefore allow this its full weight, and grant that there is as great, or even a greater, difference between the sounds of the different *tenses* of a Latin verb, than there is between the words that are equivalent to them in English. But as we here consider the variety of sounds of the language in general, before any just conclusion can be drawn, we must not only compare the different parts of the same verb, but also compare the different verbs with one another in each of these languages. And here, at first view, we perceive a most striking distinction in favour of the *analogous* language over the *inflected*; for, as it would be impossible to form a particular set of inflections, different from one another, for each particular verb, all those languages which have adopted this method have been obliged to reduce their verbs into a small number of classes, all the words of each of which classes, commonly called *conjugations*, have the several variations of the *modes*, *tenses*, and *persons*, expressed exactly in the same manner, which must of necessity introduce a similarity of sounds into the language in general, much greater than where every particular verb always retains its own distinguishing sound. To be convinced of this, we need only repeat any number of verbs in Latin and English, and observe on which side the preference with respect to variety of sounds must fall.

Pono,	*I put.*	Moveo,	*I move.*
Dono,	*I give.*	Doleo,	*I ail.*
Cano,	*I sing.*	Lugeo,	*I mourn.*
Sono,	*I sound.*	Obeo,	*I die.*
Orno,	*I adorn.*	Gaudeo,	*I rejoice.*
Pugno,	*I fight.*	Incipio,	*I begin.*
Lego,	*I read.*	Facio,	*I make.*
Scribo,	*I write.*	Fodio,	*I dig.*
Puto,	*I think.*	Rideo,	*I laugh.*
Vivo,	*I live.*	Impleo,	*I fill.*
Ambulo,	*I walk.*	Abstineo,	*I forbear.*

The similarity of sounds is here so obvious in the Latin, as to be perceived at the first glance; nor can we be surprised to find it so, when we consider that all their regular verbs, amounting to four thousand or upwards, must be reduced to four conjugations, and even these differing but little from one another, which must of necessity produce the sameness of sounds which we here perceive; whereas, every language that follows the natural order, like the English, instead of this small number of uniform terminations, has almost as many distinct sounds as original verbs.

But if, instead of the present of the indicative mood, we should take almost any other tense of the Latin verb, the similarity of sounds would be still more perceptible, as many of these tenses have the same termination in all the four conjugations, particularly in the imperfect of the indicative, as below.

Pone-bam,	*I did put,*	or *was putting.*
Dona-bam,	*I did give,*	or *was giving.*
Cane-bam,	*I did sing,*	or *was singing.*
Sona-bam,	*I did sound,*	or *was sounding.*
Orna-bam,	*I did adorn,*	or *was adorning.*
Pugna-bam,	*I did fight,*	or *was fighting.*
Lege-bam,	*I did read,*	or *was reading.*
Scribe-bam,	*I did write,*	or *was writing.*
Puta-bam,	*I did think,*	or *was thinking.*
Vive-bam,	*I did live,*	or *was living.*
Ambula-bam,	*I did walk,*	or *was walking.*
Move-bam,	*I did move,*	or *was moving.*
Dole-bam,	*I did ail,*	or *was ailing.*
Luge-bam,	*I did mourn,*	or *was mourning.*
Obi-bam,	*I did die,*	or *was dying.*
Gaude-bam,	*I did rejoice,*	or *was rejoicing.*
Incipie-bam,	*I did begin,*	or *was beginning.*
Facie-bam,	*I did make,*	or *was making.*
Fodie-bam,	*I did dig,*	or *was digging.*
Ride-bam,	*I did laugh,*	or *was laughing.*
Imple-bam,	*I did fill,*	or *was filling.*
Abstine-bam,	*I did forbear,*	or *was forbearing.*

It is unnecessary to make any remarks on the Latin words in this example. But in the English translation we have carefully marked in the first column the words without any inflection; and in the second, have put down the same meaning by an inflection of our verb; which we have been enabled to do, from a peculiar excellency in our own language unknown to any other, either ancient or modern. Were it necessary to pursue this subject farther, we might observe, that the *perfect* tense in all the conjugations ends universally in I, the *pluperfect* in ERAM, and the *future* in AM or BO; in the subjunctive mood the *imperfect universally* in REM, the *perfect* in ERIM, the *pluperfect* in ISSEM, and the *future* in ERO; and as a still greater sameness is observable in the different variations for the persons in these tenses, seeing the first person plural in all tenses ends in MUS, and the second person in TIS, with little variation in the other persons, it is evident that, in respect to diversity of sounds, this method of conjugating verbs by *inflexion* is greatly inferior to the more natural method of expressing the various connections and relations of the verbal attributive by different words, usually called *auxiliaries*.

The *second* particular by which the different methods of marking the relation of the verbal attributive can affect language, arises from the variety of expressions which either of these may admit of in uttering the same sentiment. In this respect, likewise, the method of conjugation by inflection seems to be deficient. Thus the present of the indicative mood in Latin can at most be expressed only in two ways, viz. SCRIBO and EGO SCRIBO, which ought, perhaps, in strictness to be admitted only as one; whereas, in English, we can vary it in four different ways, viz. 1*st*, I WRITE; 2*dly*, I DO WRITE; 3*dly*, WRITE I DO; 4*thly*, WRITE DO I.[1] And if we consider the further variation which these receive in power as well as in sound, by having the emphasis placed on the different words, instead of four we will find eleven different variations. Thus, I *write*, with the emphasis upon the *I*; I WRITE, with the emphasis upon the word WRITE. Let any one pronounce these with the different emphases necessary, and he will be immediately satisfied that they are not only distinct from each other with respect to meaning, but also with regard to sound. The same must be understood of all the other parts of this example.

I *do write.*
I DO *write.*
I do WRITE.
WRITE *I do.*
Write I *do.*

Write I DO.
WRITE *do I.*
Write DO *I.*
Write do I.

None of the Latin tenses admit of more variations than the two above mentioned; nor do almost any of the English admit of fewer than in the above example; and several of these phrases, which must be considered as exact translations of some of the tenses of the Latin verb, admit of many more. Thus the imperfect of the subjunctive mood, which in Latin admits of the above two variations, admits in English of the following:

I might have written.
Written I might have.
Have written I might.

Written might have I.
I written might have.
Have written might I.

And if we likewise consider the variations which may be produced by a variation of the emphasis, they will be as under:

I *might have written.*
I MIGHT *have written.*
I might HAVE *written.*
I might have WRITTEN.
WRITTEN *I might have.*
Written I *might have.*
Written I MIGHT *have.*
Written I might HAVE.
HAVE *written I might.*
Have WRITTEN *I might.*
Have written I *might.*
Have written I MIGHT.

WRITTEN *might have I.*
Written MIGHT *have I.*
Written might HAVE *I.*
Written might have I.
I *written might have.*
I WRITTEN *might have.*
I written MIGHT *have.*
I written might HAVE.
HAVE *written might I.*
Have WRITTEN *might I*
Have written MIGHT *I.*
Have written might I.

In all twenty-four variations, instead of two. If we likewise consider that the Latins were obliged to employ the same word, not only to express "I *might* have written," but also, "I *could*, I *would*, or I *should* have written," each of which would admit of the same variations as the word *might*, we have in all *ninety-six* different expressions in English for the same phrase, which in Latin admits only of two, unless they have recourse to other forced turns of expression, which the defects of their verbs in this particular has compelled them to invent.

But if it should be objected that the last circumstance we have taken notice of as a defect can only be considered as a defect of the Latin language, and is not to be attributed to the inflection of their verbs, seeing they might have had a particular tense for each of these different words *might*, *could*, *would*, and *should*; we answer, that even admitting this excuse to be valid, the superiority of the analogous language as such still remains in this respect as twelve to one. Yet even this concession is greater than ought to have been made. For as the difficulty of forming a sufficient variety of words for all the different modifications which a verb may be made to undergo is too great for any rude people to overcome, we find, that every nation which has adopted this mode of inflection, not excepting the Greeks themselves, has been obliged to remain satisfied with fewer words than would have been necessary even to effect this purpose, and make the same word serve a double, treble, or even quadruple office, as in the Latin tense which gave rise to these observations. So that, however in physical necessity this may not be chargeable upon the particular mode of construction, yet in moral certainty it must always be the case; and therefore we may safely conclude, that the mode of varying verbs by inflection affords less variety in the arrangement of the words of the particular phrases, than the method of varying them by the help of auxiliaries.

But if there should still remain any shadow of doubt in the mind of the reader, whether the method of varying the verbs by *inflection* is inferior to that by *auxiliaries*, with regard to diversity of sounds or variety of expression, there cannot be the least doubt that, with respect to precision, distinctness, and accuracy in expressing any idea, the latter enjoys a superiority beyond all comparison. Thus the Latin verb *amo* may be Englished either by the words *I love* or *I do love*, and the emphasis placed upon any of the words that the circumstances may require; by means of which the meaning is pointed out with a force and energy which it is altogether impossible to produce by the use of any single word. The following line from Shakspeare's *Othello* may serve as an example:

Excellent wretch!
Perdition catch my soul, but *I* DO *love* thee.

Here the strong emphasis on the word DO gives it a force and energy which conveys, in an irresistible manner, a most perfect knowledge of the situation of the mind of the speaker at the time. That the whole energy of the expression depends upon this seemingly insignificant word, we may be at once satisfied of by keeping it away, in this manner:

Excellent wretch!
Perdition catch my soul, but *I love* thee.

How poor, how tame, how insignificant is this, when compared with the other. Here nothing remains but a tame assertion, ushered in with a pompous exclamation, which could not here be introduced with any degree of propriety. Whereas, in the way that Shakspeare has left it to us, it has an energy which nothing can surpass; for, overpowered with the irresistible force of Desdemona's charms, this strong exclamation is extorted from the soul of Othello in spite of himself. Surprised at this tender emotion, which brings to his mind all those amiable qualities for which he had so much esteemed her, and at the same time fully impressed with the firm persuasion of her guilt, he bursts out into that seemingly inconsistent exclamation, *Excellent wretch!* and then he adds in the warmth of his surprise, thinking it a thing most astonishing that any warmth of affection should still remain in his breast, he even confirms it with an oath, *Perdition catch my soul, but I* DO *love thee.* "In spite of all the falsehoods with which I know thou hast deceived me, in spite of all the crimes of which I know thee guilty, in spite of all those reasons for which I ought to hate thee, in spite of myself, still I find that I love; yes, I DO love thee." We look upon it as a thing altogether impossible to transfuse the energy of this expression into any language whose verbs are regularly inflected.

---

[1] We are sufficiently aware that the last variation cannot in strictness be considered as good language, although many examples of this manner of using it in serious composition, both in poetry and prose, might easily be produced from the best authors in the English language. But, however unjustifiable it may be to use it in serious composition, yet, when judiciously employed in works of humour, this and other forced expressions of the like nature produce a fine effect, by giving a burlesque air to the language, and beautifully contrasting it with the purer diction of solid reasoning. Shakspeare has on many occasions showed how successfully these may be employed in composition, particularly in drawing the character of Ancient Pistol in Henry V. Without this liberty, Butler would have found greater difficulty in drawing the inimitable character of Hudibras. Let this apology suffice for having inserted this and other variations of the same kind, which, although they may be often improper for serious composition, have still their use in language.

In the same manner we might go through all the other tenses, and show that the same superiority is to be found in each. Thus, in the *perfect tense* of the Latins, instead of the simple AMAVI, we say I HAVE LOVED; and by the liberty we have of putting the emphasis upon any of the words which compose this phrase, we can in the most accurate manner fix the precise idea which we mean to excite; for if we say, I *have loved*, with the emphasis upon the word *I*, it at once points out the person as the principal object in that phrase, and makes us naturally look for a contrast in some other person, and the other parts of the phrase become subordinate to it: "HE *has loved* thee much, but I *have loved* thee infinitely more." The Latins, too, as they were not prohibited from joining the pronoun with their verb, were also acquainted with this excellence, which Virgil has beautifully used in this verse:

> Nos patriam fugimus;
> TU, Tityre, lentus in umbra, &c.

We are not only enabled thus to distinguish the person in as powerful a manner as the Latins, but can also with the same facility point out any of the other circumstances as principals; for if we say, with the emphasis upon the word *have*, "I HAVE *loved*," it as naturally points out the time as the principal object, and makes us to look for a contrast in that peculiarity, I HAVE: "I *have* loved indeed; my imagination *has* been led astray, my reason *has* been perverted; but, *now* that time has opened my eyes, I can smile at those imaginary distresses which once perplexed me." In the same manner we can put the emphasis upon the other word of the phrase, *loved*; "I *have* LOVED." Here the passion is exhibited as the principal circumstance; and as this can never be excited without some object, we naturally wish to know the object of that passion, "Who! what have you *loved?*" are the natural questions we would put in this case. "I have LOVED Eliza." In this manner we are, on all occasions, enabled to express, with the utmost precision, that particular idea which we would wish to excite, so as to give an energy and perspicuity to the language, which can never be attained by those languages whose verbs are conjugated by inflection; and if to this we add the inconvenience which all inflected languages are subject to, by having too small a number of tenses, so as to be compelled to make one word on many occasions supply the place of two, three, or even four, the balance is turned still more in our favour. Thus, in Latin, the same word, AMABO, stands for *shall* or *will* love, so that the reader is left to guess from the context which of the two meanings it was most likely the writer had in view. In the same manner *may* or *can* love are expressed by the same word, AMEM; as are also *might, could, would,* or *should* love, by the single word AMAREM, as we have already observed, so that the reader is left to guess which of these four meanings the writer intended to express; an ambiguity which occasions a perplexity very different from that clear precision which our language allows of, by not only pointing out the different words, but also by allowing us to put the emphasis upon any of them we please, which superadds energy and force to the precision it would have had without that assistance.

Upon the whole, therefore, after the most candid examination, we must conclude that the method of conjugating verbs by *inflection* is inferior to that which is performed by the help of *auxiliaries;* because it does not afford such a diversity of sounds, nor allow such variety in the arrangement of expression for the same thought, nor give so great distinction and precision in the meaning. It is, however, attended with one considerable advantage above the other method; for as the words of which it is formed are necessarily of great length, and more sonorous than in the analogous languages, it admits of a more flowing harmony of expression; for the number of monosyllables in this last greatly checks that pompous dignity which naturally results from longer words. Whether this single advantage is sufficient to counterbalance all the other defects with which it is attended, is left to the judgment of the reader to determine. But we may remark before we quit the subject, that even this excellence is attended with some peculiar inconveniences, which shall be more particularly pointed out in the sequel.

But perhaps it might still be objected, that although the comparisons we have made above may be fair, and the conclusion just, with regard to the Latin and English languages, yet it does not appear clear, that on that account the method of conjugating verbs by *inflection* is *inferior* to that by *auxiliaries;* for although it be allowed that the Latin language is defective in point of tenses; yet if a language were formed which had a sufficient number of inflected tenses to answer every purpose; if it had, for instance, a word properly formed for every variation of each tense; ene for *I love*, another for *I do love;* one for *I shall*, another for *I will love;* one for *I might*, another for *I could*, and *would*, and *should love;* and so on through all the other tenses; that this language would not be liable to the objections we have brought against the inflection of verbs; and that of course the objections we have brought are only valid against those languages which have followed that mode and executed it imperfectly. We answer, that although this would in some measure remedy the evil, yet it would not remove it entirely. For, in the first place, unless every verb, or every small number of verbs, were conjugated in one way, having the sound of the words in each tense, and division of tenses, as we may say, different from all the other conjugations, it would always occasion a sameness of sound, which would in some measure prevent that variety of sounds so proper for a language. And even if this could be effected, it would not give such a latitude to the expression as auxiliaries allow; for although there should be two words, one for *I might*, and another for *I could* love, yet as these are single words, they cannot be varied; whereas, by auxiliaries, either of these can be varied twenty-four different ways, as has been shown above. In the last place, no single word can ever express all that variety of meaning which we can do by the help of our auxiliaries and the emphasis. *I have loved*, if expressed by any one word, could only denote at all times one distinct meaning, so that to give it the power of ours, three distinct words at least would be necessary. However, if all this were done; that is, if there were a distinct conjugation formed for every forty or fifty verbs; if each of the tenses were properly formed, and all of them different from every other tense as well as every other verb; and these all carried through each of the different persons, so as to be all different from one another; and if likewise there were a distinct word to mark each of the separate meanings which the same tense could be made to assume by means of the emphasis; and if all this infinite variety of words could be formed in a distinct manner, different from each other, and harmonious; this language would have powers greater than any that could be formed by auxiliaries, if it were possible for the human powers to acquire such a degree of knowledge as to be able to employ it with facility. But how could this be attained, since upwards of ten thousand words would be necessary to form the variations of any one verb, and a hundred times that number would not include the knowledge of the verbs alone of such a language?[1] How much, therefore, ought we to admire the simple perspicuity of our language, which enables us, by the proper application of ten or twelve seemingly trifling words, the meaning and use of which can be attained with the utmost ease, to express all that could be expressed by this unwieldy apparatus? What can equal the simplicity or the power of the one method, but the well-known powers of the twenty-four letters, the knowledge of which can be obtained with so much ease, whilst their powers know no limits? or, what can be compared to the fancied perfection of the other, but the transcript of it which the Chinese seem to have formed in their unintelligible language?

Having thus considered pretty fully the advantages and defects of each of these two methods of varying verbs, we cannot help feeling a secret wish arise in our mind, that there had been a people sagacious enough to have united the powers of the one method with those of the other; nor can we help being surprised, that among the changes which took place in the several languages of Europe after the downfall of the Roman monarchy, some of them did not accidentally stumble on the method of doing it. From many concurring circumstances, it seems probable that the greater part, if not all, of the Gothic nations that overran Italy at that time, had their verbs varied by the help of auxiliaries; and many of the modern European languages which have sprung from them, have so far borrowed from the Latin, as to have some of the tenses of their verbs inflected. Yet the English alone have in any instance combined the joint powers of the two, which could only be done by forming inflections for the different tenses in the same manner as the Latins, and at the same time retaining the original method of varying them by auxiliaries; by which means either the one or the other method could have been employed as occasion required. We have luckily two tenses formed in that way, the *present* of the indicative, and the aorist of the *past*. In almost all our verbs these can be declined either with or without auxiliaries. Thus the present, without an auxiliary, is, *I love, I write, I speak;* with an auxiliary, *I do write, I do love, I do speak.* In the same manner, the past tense, by inflection, is, *I loved, I wrote, I spoke;* by auxiliaries, *I did love, I did speak, I did write.* Every author who knows any thing of the power of the English language, knows the use which may be made of this distinction. What a pity is it that we should have stopt short so soon. How blind was it in many other nations to imitate the defects without making a proper use of that beautiful language which is now numbered among the dead.

After the verbs, the next most considerable variation we find between the *analogous* and *transpositive* languages is in the nouns; the latter varying the different cases of these by *inflection;* whereas the former express all the different variations of them by the help of other words prefixed, called *prepositions.* Now, if we consider the advantages or disadvantages of either of these methods under the same heads as we have done the verbs, we shall find, that with regard to the first particular, viz. variety of sounds, almost the same remarks may be made as upon the verbs; for if we compare any particular noun by itself, the variety of sound appears much greater between the different cases in the *transpositive,* than between the translation of these in the *analogous* language. Thus REX, REGIS, REGI, REGEM, &c. are more distinct from one another in point of sound, than the translation of these, *a king, of a king, to a king, a king,* &c. But if we proceed one step further, and consider the variety which is produced in the language in general by the one or the other of these methods, the case is entirely reversed. For as it would have been impossible to form distinct variations, different from one another, for each case of every noun, they have been obliged to reduce all their nouns into a few general classes, called *declensions,* and to give to all those included under each class the same termination in every case, which produces a like similarity of sound with what we already observed was occasioned to the verbs from the same cause; whereas, in the analogous languages, as there is no necessity for any constraint, there is almost as great a variety of sounds as there are of nouns. The Latins have only five different declensions; so that all the great number of words of this general order must be reduced to the very small diversity of sounds which these few classes admit of; and even the sounds of these few classes are not so much diversified as they might have been, as many of the different cases in the different declensions have exactly the same sounds, as we shall have occasion to remark more fully hereafter. We might here produce examples to show the great similarity of sounds between different nouns in the Latin language, and variety in the English, in the same way as we did of the verbs; but as every reader in the least acquainted with these two languages can satisfy himself in this particular, without any further trouble than by marking down any number of Latin nouns, with their translations into English, we think it unnecessary to dwell longer on this particular.

But if the inflection of nouns is a disadvantage to a language in point of diversity of sounds, it is very much the reverse with regard to the variety it allows in the arranging the words of the phrase. Here, indeed, the transpositive language shines forth in all its glory, and the analogous must yield the palm without the smallest dispute. For as the *nominative case,* or that noun which is the cause of the energy expressed by the verb, is different from the *accusative,* or that noun upon which the energy expressed by the verb is exerted, these may be placed in any situation that the writer shall think proper, without occasioning the smallest confusion; whereas in the analogous languages, as these two different states of the noun are expressed by the same word, they cannot be distinguished

---

[1] This assertion may perhaps appear to many very much exaggerated; but if any one should think so, we only beg the favour that he will set himself to mark all the variations of tenses, mode, person, and number, which an English verb can be made to assume, varying each of these in every way that it will admit, both as to the diversity of expression and the emphasis, and he will soon be convinced that we have here said nothing more than enough.

but by their position alone; so that the noun which is the efficient cause must always precede the verb, and that which is the passive subject must follow, which greatly cramps the harmonious flow of composition. Thus the Latins, without the smallest perplexity in the meaning, could say either *Brutum amavit Cassius*, or *Cassius amavit Brutum*, or *Brutum Cassius amavit*, or *Cassius Brutum amavit.* As the termination of the word *Cassius* always points out that it is in the *nominative case*, and therefore that he is the person from whom the energy proceeds; and in the same manner, as the termination of the word *Brutum* points out that it is in the *accusative case*, and consequently that he is the object upon whom the energy is exerted; the meaning continues still distinct and clear, notwithstanding of all these several variations; whereas, in the English language, we could only say, *Cassius loved Brutus*, or, by a more forced phraseology, *Cassius Brutus loved.* Were we to reverse the case, as in the Latin, the meaning also would be reversed; for if we say *Brutus loved Cassius*, it is evident, that instead of being the person beloved, as before, *Brutus* now becomes the person from whom the energy proceeds, and *Cassius* becomes the object beloved. In this respect, therefore, the analogous languages are greatly inferior to the transpositive; and, indeed, it is from this single circumstance alone that they derive their chief excellence.

But although it thus appears evident that any language which has a particular variation of its nouns to distinguish the *accusative* from the *nominative case*, has an advantage over those languages which have none; yet it does not appear that any other of their *cases* adds to the variety, but rather the reverse; for in Latin we can only say *Amor Dei;* in English the same phrase may be rendered either *the love of God, of God the love*, or, by a more forced arrangement, *God the love of.* And as these oblique cases, as the Latins called them, except the accusative, are clearly distinguished from one another and from the nominative by the preposition which accompanies them, we are not confined to any particular arrangement with regard to these, as with the accusative, but may place them in what order we please, as in Milton's elegant invocation at the beginning of Paradise Lost.

> Of man's first disobedience, and the fruit
> Of that forbidden tree, whose mortal taste
> Brought death into the world, and all our wo,
> With loss of Eden, till one greater man
> Restore us, and regain the blissful seat,
> Sing, heavenly muse.

In this sentence the transposition is almost as great as the Latin language would admit of, and the meaning as distinct as if Milton had begun with the plain language of prose.

Before we leave this head, we may remark, that the little attention which seems to have been paid to this peculiar advantage derived from the use of an accusative case different from the nominative, is somewhat surprising. The Latins, who had more occasion to attend to this with care than any other nation, and even the Greeks themselves, have in many cases overlooked it, as is evident from the various instances we meet with in their languages where this is not distinguished. For all nouns of the neuter gender, both in Greek and Latin, have in every declension their nominative and accusative singular alike. Nor in the plural of such nouns is there any distinction between these two cases; and in Latin all nouns whatever of the third, fourth, and fifth declensions, of which the number is very considerable, have their nominative and accusative plural alike. So that their language reaps no advantage in this respect from almost one half of their nouns. Nor have any of the modern languages in Europe, however much they may have borrowed from the ancient languages in other respects, attempted to copy from them in this particular; from which perhaps more advantage would have been gained than from copying all the other supposed excellencies of their language. But to return to our object.

It remains that we consider whether the inflection of nouns gives any advantage over the method of defining them by prepositions, in point of distinctness and precision of meaning? But in this respect, too, the analogous languages must come off victorious. Indeed, this is the particular in which their greatest excellence consists; nor was it, we believe, ever disputed but that, in point of accuracy and precision, this method must excel all others, however it may be defective in other respects. We observed under this head, when speaking of verbs, that it might perhaps be possible to form a language by inflection which should be capable of as great accuracy as in the more simple order of auxiliaries; but this would have been such an infinite labour that it was not to be expected that ever human powers would have been able to accomplish it. More easy would it have been to have formed the several inflections of the nouns so different from one another as to have rendered it impossible ever to mistake the meaning. Yet even this has not been attempted. And as we find that those languages which have adopted the method of inflecting their verbs are more imperfect in point of precision than the other, so the same may be said of inflecting the nouns; for, not to mention the energy which the analogous languages acquire by putting the accent upon the noun, or its preposition, when in an oblique case, according as the subject may require, to express which variation of meaning no particular variety of words have been invented in any inflected language, they are not even complete in other respects. The Latin, in particular, is in many cases defective, the same termination being employed in many instances for different cases of the same noun. Thus the genitive and dative singular, and nominative and vocative plural, of the first declension, are all exactly alike, and can only be distinguished from one another by the formation of the sentence; as are also the nominative, vocative, and ablative singular, and the dative and ablative plural. In the second, the genitive singular and nominative and vocative plural are the same, as are also the dative and ablative singular, and dative and ablative plural, except those in UM, whose nominative, accusative, and vocative singular, and nominative, accusative, and vocative plural, are alike. The other three declensions agree in as many of their cases as these do, which evidently tends to perplex the meaning, unless the hearer is particularly attentive to and well acquainted with the particular construction of the other parts of the sentence; all of which is totally removed, and the clearest certainty exhibited at once, by the help of prepositions in the analogous languages.

It will hardly be necessary to enter into such a minute examination of the advantages or disadvantages attending the variation of *adjectives;* as it will appear evident, from what has been already said, that the endowing them with terminations similar to, and corresponding with, *substantives*, must tend still more to increase the similarity of sounds in any language, than any of those particulars we have already taken notice of; and were it not for the liberty which they have, in transpositive languages, of separating the adjective from the substantive, this must have occasioned such a jingle of similar sounds as could not fail to have been most disgusting to the ear: but as it would have been impossible in many cases, in those languages where the verbs and nouns are inflected, to have pronounced the words which ought to have followed each other, unless their adjectives could have been separated from the substantives; therefore, to remedy this inconvenience, they were forced to devise this unnatural method of inflecting them also; by which means it is easy to recognise to what substantive any adjective has a reference, in whatever part of the sentence it may be placed. In these languages, therefore, this inflection, both as to gender, number, and case, becomes absolutely necessary; and, by the diversity which it admitted in the arranging the words of the several phrases, might counterbalance the jingle of similar sounds which it introduced into the language.

Having thus examined the most striking particulars in which the transpositive and analogous languages differ, and endeavoured to show the general tendency of every one of the particulars separately, it would not be fair to dismiss the subject without considering each of these as a whole, and pointing out their general tendency in that light: for we all know, that it often happens in human inventions, that every part which composes a whole, taken separately, may appear extremely fine; and yet, when all these parts are put together, they may not agree, but produce a jarring and confusion very different from what we might have expected. We therefore imagine a few remarks upon the genius of each of these two distinct *idioms* of language, considered as a whole, will not be deemed useless.

Although all languages agree in this respect, that they are the means of conveying the ideas of one man to another; yet as there is an infinite variety of ways in which we might wish to convey these ideas, sometimes by the easy and familiar mode of conversation, and at other times by more solemn addresses to the understanding, by pompous declamation, &c. it may so happen, that the genius of one language may be more properly adapted to the one of these than the other, while another language may excel in the opposite particular. This is exactly the case in the two general *idioms* of which we now treat. Every particular in a transpositive language is peculiarly calculated for that solemn dignity which is necessary for pompous orations. Long-sounding words, formed by the inflection of the different parts of speech; flowing periods, in which the attention is kept awake by the harmony of the sounds, and in expectation of that word which is to unravel the whole; if composed by a skilful artist, are admirably suited to that solemn dignity and awful grace which constitute the essence of a public harangue. On the contrary, in private conversation, where the mind wishes to unbend itself with ease, these become so many clogs which encumber and perplex. At these moments we wish to transfuse our thoughts with ease and facility, we are tired with every unnecessary syllable, and wish to be freed from the trouble of attention as much as may be. Like our state robes, we would wish to lay aside our pompous language, and enjoy ourselves at home with freedom and ease. Here the solemnity and windings of the *transpositive* language are burdensome; while the facility with which a sentiment can be expressed in the *analogous* language is the thing that we wish to acquire. Accordingly, in Terence and Plautus, where the beauties of dialogue are most charmingly displayed, transposition is sparingly used. In this humble, though most engaging sphere, the analogous language moves unrivalled; in this it wishes to indulge, and never tires. But it in vain attempts to rival the *transpositive* in dignity and pomp: the number of monosyllables interrupts the flow of harmony; and although they may give a greater variety of sounds, yet they do not naturally possess that dignified gravity which suits the other language. This, then, must be considered as the striking particular in the genius of these two different *idioms*, which marks their characters.

If we consider the effects which these two different characters of language must naturally produce upon the people who employ them, we will soon perceive, that the genius of the *analogous* language is much more favourable for the most engaging purposes of life, the civilizing the human mind by mutual intercourse of thought, *than the transpositive.* For as it is chiefly by the use of speech that man is raised above the brute creation; as it is by this means he improves every faculty of his mind, and, to the observations which he may himself have made, has the additional advantage of the experience of those with whom he may converse, as well as the knowledge which the human race have acquired by the accumulated experience of all preceding ages; as it is by the enlivening glow of conversation that kindred souls catch fire from one another, that thought produces thought, and each improves upon the other, till they soar beyond the bounds which human reason, if left alone, could ever have aspired to; we must surely consider that language as the most beneficial to society which most effectually removes those bars that obstruct its progress. Now, the genius of the *analogous* languages is so easy, so simple and plain, as to be within the reach of every one who is born in the kingdom where it is used to speak it with facility; even the rudest among the vulgar can hardly fall into any considerable grammatical errors: whereas, in the *transpositive* languages, so many rules are necessary to be attended to, and so much variation is produced in the meaning, by the slightest variations in the sound, that it requires a study far above the reach of the illiterate mechanic ever to attain. So that, how perfect soever the language may be when spoken with purity, the bulk of the nation must ever labour under the inconvenience of rudeness and inaccuracy of speech, and all the evils which this naturally produces. Accordingly, we find, that in Rome, a man, even in the highest rank, received as much honour, and was as much distinguished among his equals, for being able to converse with ease, as a modern author would be for writing in an easy and elegant style; and Cæsar among his contemporaries was as much esteemed for his superiority in speaking the language in ordinary conversation with ease and elegance, as for his powers of oratory, his skill in arms, or his excellence in literary composition. It is needless to point out the many inconveniences which this must unavoidably produce in a state. It is sufficient to observe, that it naturally tends to introduce a vast distinction between the orders of men; to set an impenetrable barrier between those born in a high and those born in a low station; to keep the latter in ignorance and barbarity, while it elevates the former to such a height as must subject the other to be easily led by every popular demagogue. How far the history of the nations who have followed this *idiom* of language confirms this observation, every one is left to judge for himself.

II. AFFINITIES OF LANGUAGES.[1]

The study of the affinities of various languages is so far one of the most important of all branches of human knowledge, as it affords, when properly applied, an unerring test of the truth or falsehood of historical evidence, without which it would sometimes be impossible to unravel the mysteries of contradictory testimonies, respecting the relations of the different races of mankind. We have, for example, no traditional evidence in support of any connection between the ancient Egyptians and the Indians; whilst, on the other hand, a number of persons, who came with the English army from the East Indies into Egypt, were so strongly impressed with the resemblance of the

---

[1] This part of the article was written by the late Dr Thomas Young, for the *Supplement* to the former editions of this work.

Egyptian and Indian temples, which appeared even to excite the religious feelings of many of the natives who were amongst the troops employed, that a very general inclination has arisen from these circumstances, to consider the Egyptian mythology as merely a branch of the Indian. But if the Egyptian people had really been of Indian origin; that is, if the Egyptians and Indians had really been one people, at any later period than that at which the whole of the Indian and European races were separated from their common stock; the languages of India and of Egypt could not but have exhibited some features of resemblance, which would have preserved the traces of the connection; whilst, in fact, there is much less similarity between the Egyptian and the Indian, than between the Indian and the Greek, or the English and the Persian; so that etymology may here be adduced as confirming the evidence, or as justifying the silence, of history; and the resemblance of the mythological representations must be considered as in great measure accidental.

It is, however, only with regard to the languages of the ancient world that we can feel much interest in such an investigation. The American dialects might afford equally extensive subjects of speculation in a metaphysical and critical point of view; but the concerns of barbarians, unconnected and remote from all contact with literature or civilization, and destitute of all historical records, will scarcely be thought to require any great portion of attention from a philosophical inquirer; and there is ample scope for the employment of all our faculties in the analysis and comparison of the various languages of Europe, Asia, and Africa. If, indeed, an extraordinary exertion of enterprise and industry, which can be expected from a few distinguished individuals only in the course of as many centuries, should make known relations, such as Alexander von Humboldt has appeared to discover, between the American and Asiatic nations, a new field would be opened for the gratification of our curiosity; but it can scarcely be expected that these points of resemblance can be sufficiently numerous to afford any thing like demonstrative evidence, until the whole subject has been much more deeply and repeatedly discussed. In the mean time, a very brief enumeration of the names of the American languages is all that can be required, on an occasion like the present; except the insulated though interesting remark, that the countries separated by Behring's Straits exhibit, as might indeed be expected, strong resemblances in some of their languages.

Of language in general we do not here intend to treat, but merely of languages as they are distinct from each other. It is not, however, very easy to say what the definition ought to be that should constitute a separate language; but it seems most natural to call those languages distinct, of which the one cannot be understood by common persons in the habit of speaking the other, so that an interpreter would be required for communication between persons of the respective nations. Still, however, it may remain doubtful whether the Danes and the Swedes could not, in general, understand each other tolerably well, and whether the Scottish Highlanders and the Irish would be able to drink their whisky together without an interpreter; nor is it possible to say, if the twenty ways of pronouncing the sounds belonging to the Chinese characters, ought or ought not to be considered as so many languages or dialects, though they would render all oral intercourse between the persons so speaking the language actually impracticable. But, whether we call such variations different languages, or different dialects, or merely different pronunciations of the same dialect, it is obvious that they ought all to be noticed in a complete history of languages; and, at the same time, that the languages so nearly allied must stand next to each other in a symmetrical order; the perfection of which would be, to place the nearest together those languages in which the number of coincidences in the signification of words throughout the language are the most numerous.

It has sometimes been imagined, that all languages in existence present something like a trace of having been deduced from a common origin; and it would be difficult to confute this opinion by very positive evidence, unless every separate language had been very completely analysed and examined by a person well acquainted with a variety of other languages, with which it might be compared. But, without such an examination, the opinion must remain conjectural only, and no more admissible as demonstrated, than the opinions of some empirics, that there is only one disease, and that the only remedy for it is brandy. In an essay on probabilities, lately published in the *Philosophical Transactions*, Dr Young has remarked, that "nothing whatever could be inferred, with respect to the relation of two languages, from the coincidence of the sense of any single word in both of them," that is, supposing the same simple and limited combinations of sounds to occur in both, but to be applied accidentally to the same number of objects, without any common links of connection; "and that the odds would only be three to one against the agreement of two words, but if three words appeared to be identical, it would be more than ten to one that they must be derived, in both cases, from some parent language, or introduced in some other manner," from a common source; whilst "six words would give near 1700 chances to one, and eight near 100,000; so that, in these last cases, the evidence would be little short of absolute certainty."

The author of the article in the *Quarterly Review*, on Adelung's *Mithridates* observes, that, setting out from the establishment of a certain number of separate languages as species, "we may proceed to comprehend, in the description of one *family*, such as have more coincidences with each other than diversities, and to refer to the same *class* such families as exhibit any coincidences at all that are not fortuitous, imitative," that is, from onomatopœia, "or adoptive. In order, however, to avoid too great a number of classes, which would arise from an inadequate comparison of languages imperfectly known, it may be proper, in some cases, to adopt a geographical distinction, as sufficient to define the limits of a class, or to assist in its subdivision into orders. We are thus obliged to employ an arrangement of a mixed nature;" and, in fact, the tests of affinity here proposed depend so much on the progress of our knowledge in the study of each language, that the results must unavoidably be liable to great uncertainty and fluctuation, so that we can reasonably expect nothing more than an approximation to an arrangement completely methodical.

"If," continues the reviewer, "the resemblance or identity of a single word, in two languages, supposed to be exempt from the effects of all later intercourse, were to be esteemed a sufficient proof of their having been derived from a common stock, it would follow, that more than half the languages of the universe would exhibit traces of such connection, in whatever order we might pursue the comparison. Thus we find in a very great number, and perhaps in a majority of known languages, that the sound of the vowel *a*, with a labial consonant, is employed for the name of *Father*; and if this be supposed to be something like an onomatopœia, or an application of the first sounds which an infant naturally utters, the same reason cannot possibly be assigned for the still more general occurrence of the combination NM in the term *name*, which is by no means likely to have originated from any natural association of this kind. But neither these points of resemblance, nor any other that can be assigned, are absolutely universal; for, besides the numberless varieties referrible more or less immediately to *Abba, Father*, we have at least twenty different and independent terms for the same relation in the old world;" *Tia, Issa, Plar, Hair, Rama, Diam, Bina, Kettem, Assainalagi, Medua, Thewes, Sünk, Iot, Anathien, Messee, Indaa, Nu, Nam, Monung, Dengabey, Ray, Tikkob*, and *Oa;* and about as many for *Name*, besides those languages in which the version of an abstract term of this kind is less likely to have been ascertained; *Ming, Tren, Diant, Sheu, Hessara, Shem, Tsarship, Ad, Nipta, Lüm, Sacheli, Assia, Wasta, Ngala, Taira, Sünna, Ran, Hhili, Ding, Dbai*, and *Anghara.* "At the same time, therefore, that we venerate the traces of our common descent from a single pair, wherever they are still perceptible, we must not expect to find them in all existing languages without exception; and an *Etymologicon Universale*, considered as intended to establish such a perfect community of derivation, can only be regarded as a visionary undertaking. Nor must we neglect to unite, in some common arrangement of classification, those languages which have the words here specified, or any other radical words, in common, as incomparably more related to each other than the Chinese to the Cantabrian, or the Irish to the Hottentot.

"The gradations, by which a language is likely to vary in a given time, seem to be in some measure dependent on the degree of cultivation of the language, and of the civilization of the people employing it. From Homer to the Byzantine historians, the Greek language remained essentially the same for 2000 years; the German has varied but little in 1500; and even the English, notwithstanding its mixture with French and Latin, has altered but three radical words out of the fifty-four which constitute the Lord's Prayer, in the same period. On the other hand, a few barbarians in the neighbourhood of Mount Caucasus and of the Caspian Sea, of modern origin, and ignorant of the art of writing, are divided into more nations speaking peculiar languages, radically different from each other, than the whole of civilized Europe. In such cases, little light can be thrown upon history by etymological researches, while, with regard to more cultivated nations, we obtain, from the examination of their languages, historical evidence of such a nature, as it is scarcely possible for either accident or design to have falsified."

According to the supposition of Professor Adelung, it seems not improbable that Thibet, on the east of Cashmere, may "have been the habitation of Adam immediately after his fall, and the country occupied by the descendants of Cain. In Thibet, and in the countries immediately beyond it, the languages of at least a hundred and fifty millions of people are still principally *monosyllabic;* and from this peculiarity, as well as from the singular simplicity of their structure, they are supposed to constitute the most ancient class of existing languages, though it must be confessed that much of Adelung's reasoning on this subject is extremely inconclusive." Mr Townsend remarks very judiciously, that one of the canons of Rudbeck is by no means admissible. "He states, that a language, which has numerous monosyllabic expressions, is a parent language. The English has more than 3700 monosyllabic expressions, and the Chinese has none but such; yet neither of them is, for that reason, to be considered as a parent language. Certain it is, that all languages, by abbreviations, have a tendency to become monosyllabic, and therefore a language which abounds in monosyllables is ancient, and these commonly are the most antiquated parts of every language. New compounds are incessantly created. These are abbreviated, and in process of time become monosyllabic. In deriving, therefore, a word in one language, from its correspondent expression in some other language, we must ever bear in mind, that, unless in the formation of new compounds, the least abbreviated is commonly the parent, and the most abbreviated its offspring. Would it be possible for any one to persuade us that *Colaphus* was derived from *Cuff*, or *Blaspheme* from *Blame?* "A similar instance," says the reviewer, "might be found in *Trachelos* and *Hals* of the Greeks and Germans; for certainly *Hals* is more like *Trachelos* than like *Collum.*

The Chinese, however, which is the principal, and probably the most ancient, of the monosyllabic languages, is distinguished from almost all others by a more marked peculiarity, which is, that its written characters, instead of depicting sounds, are the immediate symbols of the objects or ideas, and are even imperfectly represented by the sounds, whatever difference of accent or tone may be exhibited by the most refined speaker; as indeed it may happen accidentally in our own language, that we may be at a loss to explain, without circumlocution, whether we mean to say *Son* or *Sun; Beer* or *Bier; Bear* or *Bare; You, Ewe, Yew*, or *U;* but in the Chinese the real cause of this essential characteristic appears to be, that the symbol was in fact originally intended as a hieroglyphic or picture of the object, though the resemblance, coarse as it probably was at first, has been generally altogether lost by the modifications which the character has conventually undergone. And in this point of view the Chinese would require to be classed with the old Egyptian only, since we know of no other language which was habitually expressed in hieroglyphics and their immediate derivatives. It is not at all uncommon for the same sound in Coptic, as in Chinese, to have four or five senses all essentially different, as may easily be observed in turning over a dictionary; HOOU, for instance, means *Bad*, and *Them*, and a *Shower*, in two verses of St Matthew (v. 45, 46), and perhaps several other things.

Another ancient and extensive class of languages, united by a greater number of resemblances than can well be altogether accidental, may be denominated the *Indo-European*, comprehending the Indian, the West Asiatic, and almost all the European languages. If we chose to assign a geographical situation to the common parent of this class, we should place it to the south and west of the supposed origin of the human race; leaving the north for our third class, which we can only define as including all the Asiatic and European languages not belonging to the two former; which may be called Atactic, or, perhaps, without much impropriety, TATARIC; and which may be subdivided into five orders, *Sporadic, Caucasian, Tartarian, Siberian*, and *Insular.* The *African* and *American* languages will constitute a fourth and fifth class, sufficiently distinct from all the rest, but not intended to be considered as any otherwise united among themselves, than by their geographical situation. There is indeed little doubt, that some of the languages here called Tataric are essentially allied to others, which are referred to the Indo-European class; but they have been too little investigated to allow us to make the selection that would be required for completing the classification.

The following tables are copied, with considerable additions, from Adelung's *Mithridates.* The words *Heaven* and *Earth* are chosen as specimens, because they seem to be known in a greater number of languages than any others, except the name of *Father*, which is supposed to exhibit, in some cases, a fallacious similarity. The German orthography has been principally employed, except in such languages as are usually written in the Roman characters, the pronunciation of the consonants being more uniform than in English, and that of the vowels differing little from the Italian.

Kassenti (Bornu)?	Ktak (1, Obaa)	
Affadeh	Dilko	Ftüng
Mobba	Szemma	Barr
Shilluh (Darfur)	(1, Warre; 3, Koddus)	
Darrunga (Gallas)	(1, Kadenda; 3, Attih)	
Shaggai	(*Soldier*, Gonso)	
Madagascar	Danghitsi, Langhitsi, Lainch, Atemco	Tane, Tanne, Zanne
Lagoa Bay	(1, Chingea; 3, Trirarou)	
Koossa	Isuhlu	Umtsllaha
Beetjuanas	Maaro	Lehaatsi
Mutshuana	(1, Oonchela; 3, Taroo, Miraroo)	Lebochi
South Caffres	(1, Enje; 3, Atatu, Zintate)	
Hottentots	Inga?	Ki, Kōo, Qu'au Gamkamma
Coranas	(1, T’”köey)	T”kehaub
Saldanha Bay	Homma	Hü
Bosjemans	T”gachuch	T”kanguh

The Hottentots have three particular clicking sounds, made by withdrawing the tongue from the teeth, the fore part and the back part of the palate: they are respectively denoted by T’, T”, and T’”. The first two appear to resemble the sounds sometimes used to express a trifling vexation, and to make a horse go on, or to call to poultry.

V. AMERICAN CLASS.

i. South American.

	Heaven, Sky.	Earth.
A. Southern Extremity		
1. Terra del Fuego	(A. *Penguin*, Compoggre)	
2. Patagonia, Chili		
Moluchan. Araukan	Huenu (⊙, Antu; *Hill*, Calul)	Tue mapu
Tehuelhet	(*Hill*, Calille)

The tables will at least serve, notwithstanding some imperfections and uncertainties, as a convenient synopsis for facilitating the reference to a brief sketch of the history of the different families of languages.

1. The strongest proof of the great antiquity of the CHINESE language appears to be the extreme simplicity of its structure, and the want of those abbreviations and conventional implications which have been sometimes called the wings of languages. It is natural that, in attempting to express ideas at once by characters, the rude pictures of material objects should first have been principally, if not exclusively traced; thus the Egyptians had ⊙, ☽ for the *sun* and *moon*, and ⊕ for a country or *field*, and the Chinese have still 日, 月, 田 for these objects respectively, the characters having been made square instead of

round, which some of them were in their more ancient forms. The Egyptians represented a *man* by a figure kneeling, and stretching out his hand, or, in the enchorial character, thus . The Chinese figure may originally have been of the same form; but at present is more like a pair of legs only, , whilst a *dog* seems to have three or four legs; or . A thousand, according to Mr Jomard's ingenious conjecture, was copied from the lotus, with its seed vessel, having a great multitude of seeds, and the Chinese is certainly not altogether unlike the Egyptian , nor is the character for light , which seems intended to represent a radiant body, altogether different from the  or so often found among the hieroglyphics of Egypt, although it is not easy to believe, with Mr Palin, that the manuscripts found with the mummies agree precisely with a Chinese version of the Psalms of David, character for character. The successive introduction of figurative expressions and characters may easily be imagined; but it would be useless to enter at present into further details of this kind, on grounds almost entirely speculative. The Chinese are said to have been, in the ninth century, a race of people resembling the Arabs; their physiognomy was contaminated in the thirteenth and fourteenth by a mixture with their conquerors, the Mongols; but their language remained unaltered. The dialect of *Tonkin* is sometimes called the language of *Anam*, and the *Guan;* on occasions of state they use the Chinese character, but more commonly a character of their own, probably resembling that of the Siamese. Dr Leyden observes, that at least twenty different nations employ the Chinese characters, though they read them quite differently; and he considers the Cochin-Chinese, the Cantonese, and the Japanese, as all essentially different from the Mandarin Chinese, though they have all some words in common. He gives us as the names of the dialects of Chinese, constituting almost as many separate languages, 1, *Kong*, spoken at Canton; 2, *Way;* 3, *Nâm;* 4, *Chéw;* 5, *Séw;* 6, *Lŭi;* 7, *Limm;* 8, *Khum*, or Mandarin; 9, *Síu;* 10, *Kunng;* 11, *Hyong san*, spoken at *Macao;* 12, *San tahk;* 13, *Nam kéi;* 14, *Pún ngi;* 15, *Tòng khún;* 16, *Fo khun*, or *Chinchow.* There is also a language spoken by the *Quan tô*, between Tonkin and China, a people who consider themselves as more ancient than their neighbours. Notwithstanding, however, all this supposed diversity, we may trace a considerable resemblance in the spoken language, even as far as Corea. In all these dialects, the conversation is a sort of recitative, and the different notes give distinct meanings to the words; as in fact we distinguish in English the sense of M? from M! or simply M.; tones perfectly understood, though never written. The Chinese are without the sound of the letter *r*, and several other sounds common in Europe; the only way in which they express foreign words is by putting together the characters of the nearest import, with a symbol of pronunciation annexed to them; thus, for *Christus* and *Cardinalis*, they are obliged to write *Ki lu su tu su* and *Kia ul fi na li su*, with a mouth annexed to them. The names of places are generally distinguished by a square enclosing the characters which express them, and the names of men, in some books, by a line drawn on one side of the characters only. In this there seems to be a distant analogy to the ring which encloses proper names in the Egyptian inscriptions, but the names of places were not distinguished in this manner by the Egyptians. The dialects of Cambodia and Laos have received some mixture of Malayan from their neighbours; in writing the former of these, sometimes called *K'hôhmen*, according to Dr Leyden, the Bali, or old Sanscrit character, is employed; and the latter has some analogy with the Siamese; indeed, both the Siamese and the Avanese are disposed to derive themselves from Laos. It may be seen, from the specimens exhibited in the article PHILOLOGY, that at least some of the Chinese dialects have sounds agreeing in several instances with European words of the same import; but the agreement is scarcely precise enough to justify our inferring from it an original connection between the languages.

2. The language of SIAM resembles the Chinese in its simplicity and metaphorical structure, though not so decidedly monosyllabic. It is obvious, however, that the distinction of monosyllabic and polysyllabic could not, in very ancient times, have been so positively laid down as at present, since it was usual, in almost all countries, to write the words contiguous to each other in a continued series, without any divisions between them; and, even in modern printing, there is a happy invention, which often restores this agreeable obscurity, under the name of a hyphen, by the use of which we avoid the difficulty of determining whether we wish to employ one word or several. The Siamese call themselves *T'hay;* and a part of their country is distinguished by the appellation Tai hai, or Great T'hay. The numerals resemble the Mandarin Chinese; several words of the language are borrowed from the Bali; it is written in an alphabetical character, which is said to be complicated and refined.

3. The AVANESE or *Burmanish*, has also borrowed some polysyllabic words from the Bali, and is written in a peculiar alphabetical character. It must be considered as an era in the history of this country, that its emperor has employed Mr Felix Carey, at his own expense, to establish a printing press at Ava, his metropolis, for printing a translation of the Scriptures in Burmanish. A dialect, spoken in the district called Tanengrari, is said to be of greater antiquity. The *Môn* or *Peguan* is called by Dr Leyden a distinct original language; but it is written in the Avanese character, and Adelung's specimen scarcely differs at all from the Burmanish. The language of Arakan and Rashaan is called *Rukheng;* it contains a number of words from the Bali, many of them converted into monosyllables by an imperfect pronunciation. Dr Leyden considers it as the connecting link between the monosyllabic and the polysyllabic languages; and he calls it an original language, notwithstanding its acknowledged derivation from its neighbours. It employs the Devanagri alphabet, including the letter R. Out of fifty words of Rukheng, quoted by Buchanan, the seven which are not Burman are only varieties of pronunciation. The *Kiayn* or *Kolún*, and the *Kukis*, north-east of Chatigong, are mentioned as neighbouring tribes, speaking languages almost entirely different from the Rukheng. We find, in Mr Buchanan's paper, some specimens of the languages of the Burma empire, which it is difficult to distribute methodically without a further knowledge of their peculiar characters, but some of which may, without impropriety, be introduced here.

4. The language of THIBET, or the Tangutish, has some words in common with the Chinese, but is less simple in its structure. It is at least as ancient as the religion of the country, which is nearly coeval with Christianity. Its character is well known to be alphabetical, from the title of the learned work of *Father Georgi* on the subject.

5. The *Indo-European* languages have been referred to a single class, because every one of them has too great a number of coincidences with some of the others to be considered as merely accidental, and many of them in terms relating to objects of such a nature that they must necessarily have been, in both of the languages compared, rather original than adoptive. The SANSCRIT, which is confessedly the parent language of India, may easily be shown to be intimately connected with the Greek, the Latin, and the German, although it is a great exaggeration to assert any thing like its complete identity with either of these languages. Thus, we find, within the compass of the Lord's Prayer only, *Pida*, *Pitir*, among the Sanscrit terms for *Father*, Gr. *Pater*; *Nama*, or *Namadheya*, for *Name*, Gr. *Onoma*, *Onomati*; *Radshiam*, *Kingdom*, Lat. *Regnum* from *Rego*; *Munasam*, *Will*, like the Greek *Menüo*, and the Latin *Mens*; *Stira*, *Earth*, Gr. *Era*, whence perhaps the Latin *Terra*; and *Danim*, or Devanagri *Dia*, Day, Lat. *Dies*. There are also some singular resemblances of declension and conjugation between the Sanscrit and the Greek, *Dodami*, *Dodasti*, *Dodati*; in old Greek, *Didomi*, *Didosi*, *Didoti*. In a tablet of the date 23 B. C. we find *Kritico* for a *Judge*, Gr. *Crites*, *Criticos*. In Mr Townsend's work we also find some well-selected instances of resemblance between the Sanscrit and other languages: thus, *Bhru*, is *Brow*; *Pota*, a *Boat*; *Bad*, a *Bath*, Germ. *Bad*; *Dhara*, *Terra*; *Nava*, *Novus*; *Nakta*, *Nocte*, *Night*; *Pad*, *Foot*, *Patte*; *Prathama* or *Protoma*, *first*, whence we deduce both the Greek *protos* and the Latin *primus*; and *Upadesaca*, *Didasco*, *Doceo*, and *Disco*. We have also *Vayajan*, *wind*, in Russian, *Vieyanie*; and *Vidhava*, *widow*, Latin, *Vidua*, German, *Wittwe*, Russian, *Vdova*. The NT of the plural verb is found in the Sanscrit *Bhavanti*, *they are*, *Dadanti*, *they give*. Sir William Jones and many others have attributed to some of the works which are still extant in Sanscrit an antiquity of four or five thousand years; but Professor Adelung denies the validity of any of the arguments which have been adduced in favour of a date at all approaching to this.

The Sanscrit, even in its earliest state, can scarcely have been altogether uniform throughout all the countries in which it was spoken, and it has degenerated by degrees into a great diversity of modern dialects: the term signifies learned or polished. Beyond the Ganges, it is called *Bali* or *Magudha*, which, the missionaries say, "scarcely" differs from Sanscrit; the term Magudha is said to mean mixed or irregular. In Siam the Sanscrit is still the language of elegant literature; and it is often employed throughout India, with some little difference of construction, under the name of *Devanagari*, the divine language. The *Prakrit* is rather a vague term, meaning, according to Mr Colebrooke, common or vulgar; but it is also applied to the language of the sacred books of the "Jainas." We find in a little publication, entitled a *Brief View of the Baptist Missions and Translations*, some useful information respecting the Indian languages and dialects, into a great number of which these laborious and disinterested persons have made or procured translations of the whole of the Scriptures, which they have printed at Serampore, near Calcutta. The dialects, which they enumerate, are principally arranged in a geographical order; and, beginning with those which are spoken towards the middle of India, as the pure *Sanscrit* and its least modified dialects, we may place next to them the languages of the countries bordering on the monosyllabic nations, towards the north and east: we have here the dialects of *Nepal*, *Assam* or *Uhumiya*, *Tiperah*, and *Kassai*, of which little more is known than that translations into the first two have been already executed: the *Bengalee* is spoken in and about Calcutta: the *Hindee* or *Hinduvee* is spoken about Agra; it is printed in the Devanagri character, the font of which contains more than 800 varieties of letters and their combinations; the *Urdu* or *Oordoo* is a subdialect of the Hindee, as well as the *Brijbassa*, which is nearer to the Sanscrit than some other dialects: the *Jypura* is mentioned as another language belonging to the same neighbourhood: the *Hindustanee* is spoken in Hindustan Proper, or Lower Hindustan; the missionaries say it is "*diametrically* different" from the Hindee: the *Moors* or "Mongol Indostanish" seems to belong to this country, being mixed with a good deal of Persian and Arabic, unless it be rather referrible to the Hindee: the dialects of *Udaipura*, *Benares*, and *Munipura*, are also called separate languages: the *Goandee* is spoken at Nagpore, in the Mahratta country: further east is *Orissa* or *Uriya*, the language of which is printed in a character requiring 300 different types: the *Telug* or *Warug* is spoken about Cuddalore and Madras: the *Telinga* further west: the *Carnatic* has a peculiar language, besides the *Tamul*, which is spoken from Paleacate, near Madras, to Cape Comorin, and the *Marwa*, which appears to belong to a part of this country. About Cochin in Travancore we have the *Maleiam*: further north, the languages of *Malabar*, *Kanara*, and of the *Decan*; the dialect of Malabar is of considerable antiquity, being found in two copper tablets as old as the eighth or ninth century: then comes the *Kunkuna*, about Bombay: the *Mahratta* is further inland: the *Guzurat* on the coast: and, beyond the Indus, the *Beloshee* in Belochistan: north of this we find the *Afghan* or *Pushtu* language, which contains more Hebrew words than any of its neighbours; the people are said to have come from the north about 2000 years ago, and, according to a Persian tradition, to be descended from King Saul; indeed the language stands somewhat more correctly under the Median family in the *Mithridates*, but since it forms the connecting link between the two families, it might perhaps be as conveniently arranged among the more numerous species of the Sanscrit; it is written in the Arabic character, with some additional letters for expressing the Sanscrit sounds. The language of *Multan*, north of Sindh, has about one tenth of Persian mixed with it. The *Gipsies* were certainly expelled from some part of India by the cruelties of Timur Leng, about the year 1400; and they were probably some of the *Zingans*, in the neighbourhood of Multan, their language having a great number of coincidences with that of Multan, and being still more manifestly a dialect of the Sanscrit, although they have adopted many European, and especially Sclavonian words. When they first appeared in Europe, they were supposed to amount to about half a million; at present they are less numerous.

The *Maldivian* is peculiar to the group of small islands from which it is named; the Baptists have already printed some books in it. The people are said greatly to resemble those of Ceylon. The *Cingalese*, which is spoken in great part of Ceylon, is a mixture of several of the continental dialects; and it has been observed, that the proper names in Ceylon mentioned by Ptolemy are of Sanscrit origin. Dr Leyden gives, as a proof of the antiquity of the *Malayan*, that the *Temala* of Ptolemy is derived from *Tema*, tin. The connection of this language with the Sanscrit has not been very universally admitted; and some of those who have studied it most are disposed to consider it as wholly original; but, in the purest part of the language, Dr Leyden confesses that there is a considerable resemblance to the Avanese and the Siamese; the words derived from the Sanscrit he considers as somewhat less numerous, amounting, however, to about 5000; they are generally less like the Bali than the Sanscrit; and a still smaller number are borrowed from the Arabic. The character of the monosyllabic languages is in some measure retained. Sir William Jones considered the Malayan as a derivative of the Sanscrit: Mr Marsden supposes it to have received its Sanscrit words through Gujerat; Dr Leyden rather from Kalinga or Telinga; and it exhibits some traces of the dialects of Tamul and Maleialam. Besides these various sources, it is said to have borrowed some of its simplest words from the Javanese and the Búgis; and it has become more nearly monosyllabic by dropping the first syllables of some of the words which it has adopted. The *Javanese* is said to be more ancient than the Malayan: the empire of Java was formerly powerful and flourishing: the ancient language was much like the Sanscrit, more so than the Malayan, but was written in a peculiar character. Dialects of this language are still spoken in Bali and in Madura. Leyden thinks the Malays were derived from Java; Marsden rather from Sumatra, though he allows that there are some reasons for conjecturing that an old Sanscrit colony may have settled many hundred years ago in Java, and mixed its language with a supposed mother tongue of that Asiatic race.

Of the *Sumatran* dialects, the principal, according to Dr Leyden, is the *Batta*, spoken by a people who occupy the centre of the island, and who still, like some other Indian nations, retain the custom of eating their old relations. The language seems to be partly original, and partly connected with the Malayan, and other dialects of the neighbouring islands. The *Rejang* is chiefly a mixture of Batta and Malayan; in the *Lampuhn* or Lampung there is also some Javanese. The *Achi* has admitted a still further influx of words belonging to all the Mussulman jargons of the neighbourhood, especially to that of the Mapulas of Malabar. There are other dialects of less note in Néas and the Poggy Islands, most resembling the Batta. This language is provided with a peculiar alphabet, which is remarkable for being written from the bottom of the paper upwards, like the Mexican hieroglyphics; though the Battas, as well as the Chinese, sometimes hold their books so as to read horizontally. In Borneo there appear to be several dialects, or rather separate languages; two of them, according to Dr Leyden, are the Biaju and the Tisun. The *Andaman* language is inserted here for want of a better place only; it does not appear to have any connection with the Sanscrit, and may possibly be found to be more like that of Madagascar: the people seem to belong to the Papuas, a distinct original race, according to Dr Leyden, black, and with woolly hair.

Besides the numerous translations into languages of the Indo-European class, the Baptist missionaries have also printed some Armenian and Persian works at the indefatigable press of Serampore, which is supplied by a letter-foundery and a paper-mill, belonging to the same establishment, enabling them to execute the whole business at less than half the expense of European books of the same magnitude. The little pamphlet already quoted contains also specimens of the characters of the Sanscrit, Assam, Bengalee, Mahratta, Sikh, and Cashmirian, which somewhat resemble each other in the square form of their characters; as well as of the Burman, Orissa, Telinga, and Cingalese, which have a more rounded and flourished appearance; of the Tamul, which looks a little like Armenian; of the Afghan and the Persian used in India; and of the Chinese, both as printed from blocks, and from the moveable metal types which have been cast at Serampore.

6. The connection of the MEDIAN family with the Sanscrit on one side, and with the Greek and German on the other, is sufficiently proved by the words *Abitap*, Zend. *Sun*, Sanscr. *Abitaba; Dar*, *Ter*, Pers. *Door*, Sanscr. *Dura*, *Tuwara*, Javanese, *Turi*, Gr. *Thüra*, Germ. *Thür*, *Thor; Dip*, Pers. *Land* or Island, Sanscr. *Dihp; Dochtar*, Pers. *Pothré*, Zend. *Daughter*, Gr. *Thügater*, Germ. *Tochter*, Sanscr. *Putri; Jaré*, Zend. *Year*, Sanscr. *Jahran*, Germ. *Jahr;* and *Ishk*, Zend. *Love*, Sanscr. *Itsha*. To this list we may add, from Dr Leyden, *Stree*, Zend. *Woman*, Sanscr. *Stri; Asté*, Zend. *He is*, Sanscr. *Asti*, Gr. *Esti; Hapté*, Zend. *Seven*, Sanscr. *Saptah*, Gr. *Hepta*. There are also some coincidences with the Chaldee, but the Median is certainly not a dialect of the Chaldee. Sir W. Jones and others have said that the Zendish was nearest to the Sanscrit, and the Pehlvi to the Chaldee or Arabic. In ancient Media, the *Zendish* was the language of the northern, and the *Pehlvi*, or *Parthian*, of the southern parts; the word Pehlvi or Pahalevi is supposed by Leyden to have been nearly synonymous with Pali or Bali, though this is said to be derived from Bahlika, an Indo-European country. The Zendish was more particularly appropriated to religious purposes, and the Pehlvi had in a great measure superseded it for common use at a very early period; under the Sassanides, again, from the third to the seventh century, the use of the Pehlvi was discouraged, and the old Persian substituted for it. It is said, however, that in the remote parts of the country, about Shirwan, some traces of the Pehlvi may still be found in existence. The *Zendavesta* of Zoroaster, which is still extant in Zendish, is said to have been written 520 years B. C.; and Adelung follows Anquetil in asserting its authenticity, even in opposition to the opinion of Jones and Richardson. These languages have little or no connection with the Georgian and Armenian, which have succeeded them in some of the same countries. The old Persian, which seems to be much connected with the Pehlvi, has remained in use, either as a living or as a learned language, ever since the time of the Sassanides; it was current among the Persians when they were conquered by the Arabs in the seventh century; and it is the language of the *Shah Nameh* of Firdusi, written in the tenth century, as well as of the *Ayeen Akbery*, of which the date is about 1600. The modern *Persian* became a cultivated language about the year 1000, having received a considerable mixture of Arabic and Turkish words. The term *Parsee* is commonly applied to a corrupt Pehlvi, spoken by the refugee fire-worshippers in Bombay.

The Goths are said to have inhabited, for some centuries, the countries about the Black Sea, and may originally have bordered on Persia. From this circumstance, and probably also from the effects of a later irruption of the Goths into Persia, which is recorded in history, we may easily explain the occurrence of many Persian words in German, and in the other languages of Northern Europe. Professor Adelung has examined more than two hundred cases of such resemblances, and has found only one sixth part of them in Anquetil's vocabularies of the more ancient dialects. He has, however, omitted to state what proportion the whole magnitude of these vocabularies bears to that of a complete dictionary of the language. It is well known that an essay was published a few years since in London, *On the Similarity of the Persian and English Languages;* and a more elaborate work on the relations of the Persian languages, by Mr le Pileur, has since appeared in Holland. Mr le Pileur attempts to explain the IS or S of the genitive of the northern languages, by the Persian preposition EZ, which seems to be synonymous with the Greek and Latin EX; but he has not shown that this EZ ever follows the noun to which it relates.

The *Kurds* speak a corrupt dialect of the Persian; they are probably derived from the Carduchi of the Greeks, who inhabited the Gordiæan Hills. They spread into Persia about the year 1000, and are now situated on the borders of the Persian and Turkish dominions. The language of the *Afghans,* about Candahar, is said to contain about one fourth of Persian, and some Tartarian, besides the Sanscrit which abounds in it.

7. The ARABIAN family is called by the German critics *Semitic,* from Shem the son of Noah, as having been principally spoken by his descendants. Though not intimately connected with the European languages, it is well known to have afforded some words to the Greek and Latin; it has also some in common with the Sanscrit, though apparently fewer than either the Greek or the German. Thus we have *Acer,* Hebr. a *Husbandman, Ager,* Lat. a *Field; Asther,* a *Star,* Gr. *Aster, Bara, Buri,* Germ. *Burg; Ben,* Hebr. *Son,* Sanscr. *Bun, Child; Esh,* Hebr. *Eshta,* Chald. *Fire,* Sanscr. *Aster;* and *Ish,* Hebr. *Man,* Sanscr. *Isha, Man* or *Lord.* The Hebrew *Ani, Anoki, I,* has been noticed by Townsend and others as affording an etymology for *Ego* as well as for *Ni* or *Mi* of verbs, for the *Anok* of the Egyptians, and even for the *Ngo* of the Chinese.

The northern nations of this family have sometimes been comprehended under the name *Aramaic,* in contradistinction to the middle or Canaanitish, and the southern or Arabian. The Eastern Aramaic, or old *Chaldee,* is very little known; it was the language of a people situated in the north of Mesopotamia, which is now the south of Armenia; a part of them extended themselves further south, and became Babylonians, of whose dialect some traces are said still to exist about Mosul and Diarbeker. The old Assyrians, between the Tigris and Media, were a colony of the Babylonians, and spoke a language unintelligible to the Jews (2 Kings, xviii). The Western Aramaic has become known, since the Christian era, as the *Syriac,* in which there is an ancient and valuable translation of the *New Testament.* It is still spoken about Edessa and Harran. The Palmyrene was one of its dialects; the modern *Assyrian* of the Russian vocabularies appears to be another.

The language of the Canaanites is said by St Jerome to have been intermediate between the Hebrew and the Egyptian. The people are supposed to have come originally from the Persian Gulf; the Philistines, who were found among them, to have emigrated from the Delta to Cyprus, to have been thence expelled by the Phœnicians, and to have adopted the language of the Canaanites when they settled among them. The book of Job is considered as affording some idea of the dialect of Edom; it is well known to contain many Arabisms, besides some other peculiarities. The *Phœnician* is only known from a few coins and inscriptions found chiefly in Cyprus and in Malta, and not yet very satisfactorily deciphered, though Akerblad is convinced, by some of them, that it varied but very little from the Hebrew; of its descendant, the *Punic,* or Carthaginian, a specimen is preserved in the speech of Hanno in Plautus, as happily arranged by Bochart; the objection of Adelung, respecting the want of a proper name, appearing to have arisen from a mistake. The last six lines of the text are probably either a repetition of the same speech in the old Libyan of the neighbourhood, or a jargon intended to imitate it.

The *Hebrews* originated among the Chaldeans, Terah, the father of Abraham, having been a native of Ur, or Edessa, beyond the Euphrates. They adopted the language of the Canaanites, among whom they led a nomadic life, till their residence in Egypt, which must probably have had some effect in modifying their language. After that time, however, it appears to have varied but little, in a period of 1000 years, from Moses to Malachi; and this circumstance Adelung considers as so uncommon and improbable, that he is disposed to believe that the writings of Moses must have been modernized at least as late as the time of Samuel. The old Hebrew became extinct, as a living language, about 500 B. C.; 1000 years afterwards, the Masoretic points were added, to assist in its pronunciation; and this was done in some measure upon the model of the Syro-Chaldaic, which at that time was still spoken. The Septuagint version, which is much older, supports, in the instances of many of the proper names, the reading indicated by the points; but in about as many others it appears to deviate from that system, and to agree with a mode of pronunciation founded upon the text or principal characters alone. The reading in Greek letters of Origen, in his *Hexapla,* tends, on the whole, very strongly to support the points. The *Chaldee* had superseded the Hebrew at the time of the captivity, and was gradually converted into the *Syro-Chaldaic,* which is called Hebrew in the New Testament. The Targums, and the Talmud of Babylon, are in the older Chaldee; and a Syro-Chaldaic translation of the New Testament has been discovered to be still in existence.

The *Samaritan* somewhat resembles the Chaldee. It was formed among the Phœnicians and others, who occupied the habitations of the ten tribes when they were carried into captivity by Salmanassar and Esarhaddon. Its peculiar alphabet is well known as a mere variation of the Hebrew.

The *Rabbinical* dialect was principally formed in the middle ages, among the Spanish Jews, who were chiefly descended from the inhabitants of Jerusalem; while those of Germany and Poland were generally Galileans, and spoke a ruder dialect of the Hebrew than the fugitives from the metropolis.

The *Arabs* have been a distinct, and in a great measure an independent nation, for more than 3000 years. Some of them were descended from Shem; others, as the Cushites, Canaanites, and Amalekites, from his brother Ham. Their language, as it is found in the Koran, contains some mixture of Indian, Persian, and Abyssinian words. Its grammar was little cultivated until a century or two after the time of Mahommed. It is certainly copious, but its copiousness has been ridiculously exaggerated and absurdly admired. The best Arabic is spoken by the upper classes in Yemen; in Mecca it is more mixed; in Syria corrupt, and still more so in some parts of Africa. There are dialects which require the assistance of an interpreter to make them intelligible; at the same time, it has been maintained by Aryda, a learned Arab of Syria, in contradiction to Niebuhr, that the Arabic of the Koran is still employed in conversation among the best educated of the people, as well as in correct writing. The Arabs living in houses are called Moors, and those of Africa are the best known under this name. The Mapuls or Mapulets of Malabar and Coromandel are a numerous colony of Arabs, who have been settled there above a thousand years.

The *Ethiopians* are descended from the Cushite Arabs. In the time of Nimrod they conquered Babylon; before that of Moses they emigrated into Africa, and settled in and about Tigri; in Isaiah's time they seem to have extended to Fez; and at present they occupy Tigri, Amhara, and some neighbouring countries. They became Christians in 325, but retained the initiatory ceremony of the Jews and Mussulmen. The pure or literary Ethiopic is called *Geez*, or Axumitic, in contradistinction to the Amharic, by which it was superseded as the language of common life in Amhara about the fourteenth century, although it is still spoken, without much alteration, in some parts of *Tigri*, while in others, as in *Hauasa*, a different dialect is spoken. The Ethiopic was first particularly made known in Europe by the elaborate publications of Ludolf. Mr Asselin has lately procured a translation of the whole of the Bible into the Amharic, as it is now spoken at Gondar; it was executed by the old Abyssinian traveller who was known to Bruce and to Sir William Jones, and it is said to be now printing at the expense of some of the British societies.

The *Maltese* is immediately derived from the modern Arabic, without any intervention of the Punic. The island, having been successively subject to the Phæacians, Phœnicians, Greeks, Carthaginians, Romans, and Goths, was subdued by the Arabians in the ninth century; in the eleventh the Normans conquered it; and it remained united with Sicily until it became in some measure independent, under the knights of St John.

8. The LYCIAN is only known from a few short inscriptions copied by Mr R. Cockerell, and published in Mr Walpole's collection, together with two or three longer ones, which have been lately brought from Antiphellos by the enterprising and indefatigable Mr W. J. Bankes. By means of a proper name in one of Mr Cockerell's inscriptions, we obtain a part of the alphabet; thus î is A; Δ, D; E, I; P, R; Ƽ, S; and probably Λ, H; and I, L. A further comparison of the different parts of the other inscriptions with the Greek phrases that almost uniformly accompany them, implying "FOR HIMSELF AND HIS WIFE AND HIS CHILDREN," gives us the words A, or AT'HI, *himself*; SA, *his*, or *for his*, HRDI, or perhaps HROI, *wife*; TIDAIMI, *son*; TIDAIMA, *children*; and ATBI, *and*. It does not appear that any of these words would authorize us to place the Lycian language as a member of the great Indo-European class; but it is reported to have been much mixed with Greek, and, on account of its geographical situation, it may be allowed to occupy a temporary rank between the principal oriental and European languages. If it has a shadow of likeness to any other language, it is perhaps to the Cimbric; and *Tidaimi* may also possibly be allied to the Greek *Titheno*, to nurse.

9. Respecting the ancient PHRYGIAN, we have a few traditions only, which at least agree in giving it a high antiquity, as the source of several Greek words. Thus, Plato observes, in his *Cratylus*, that the terms denoting *fire* and *water* are not derived from any other Greek words, but are Phrygian primitives. It seems, however, that *water* was called *Bedü* by the Phrygians, and the word resembles the *Bada*, *Bath*, of the northern nations, as well as the *Vate*, water, of the Swedes; *Moirai*, the fates, derived from the Phrygian, is compared to *Meyar*, virgins, of the Gothic; and *Bek*, *bread*, is as much like our *Bake*, as like the Albanian *Buk*, *bread*.

The *Greek* has no very intimate or general connection with any of the older languages which have been preserved entire, although there are a number of particular instances of its resemblance to the Sanscrit, some of which have been already mentioned; it has also many German and Celtic words, some Sclavonian, and, as it is said, a few Finnish. It can only have been immediately derived from the language of the neighbouring Thracians and Pelasgians, who seem to have come originally from the middle of Asia, through the countries north of the Black Sea, and to have occupied not only Greece and Thrace, but also the neighbouring parts of Asia Minor, where they probably retained their ancient dialect to a later period than elsewhere. The whole of the Thracian states were greatly deranged by the expedition of the Celts in 278 B. C. which terminated in their settling the colony of Galatia. The Dacians, or Getæ, who principally occupied Bulgaria, extended themselves further northwards, and afterwards constituted the Roman provinces of Mœsia and Dacia, which were conquered by the Goths in the third century. The Macedonians, in the time of Alexander, spoke a language which was nearly unintelligible to the Greeks in general; even the Pelasgi in Epirus and Thessaly long retained a dialect materially different from their neighbours, and in Arcadia still longer. The Hellenes, who emigrated from Asia Minor into Greece, were not sufficiently numerous to carry their own dialect with them, although the language assumed their name. The Græci in Italy were Pelasgians, although Dionysius of Halicarnassus includes them in the denomination Hellenic; their language must have been Æolo-Doric, and it was in this form that the Latin received its mixture of Greek; the Lacedemonian also retained it till a late period, writing, for instance, instead of *Pais*, *Poir*, as in Latin *Puer*. The *Æolic* appears once to have extended over Attica, and to have left some Æolisms in the old Attic dialect. This dialect was the principal basis of the common language of Greece at a later period, which must have been the most cultivated under the protection of the court of Alexandria, and which continued to be spoken and written in the highest circles of Constantinople throughout the middle ages. By degrees it degenerated into the modern *Romaic*, having received a mixture of Turkish and Italian, and perhaps of some other neighbouring languages.

11. The GERMAN family is sufficiently connected with a variety of others belonging to the Indo-European class, to be admitted into it upon a very short investigation. Its resemblances to the Greek, within the compass of the Lord's Prayer, besides *Father* and *Name*, are *Wille*, *Wollen*, Gr. *Boule*, perhaps *Brot* or *Proat*, *bread*, like *Artos*, and *Freyen* or *Lösen*, like *Rhüein* and *Lüsein*. Dr Jamieson has shown very clearly, in his *Hermes Scythicus*, how immediately the structure of the Gothic languages is derived from that of the Greeks. Thus the EIN of the Greek infinitive became in the Mœso-Gothic *an* or IAN, in German EN: the ICOS of the adjectives, Mœso-Gothic, AGS, IGS, or EIGS, as *mahteigs*, *mighty*, Germ. *machtig*; the Sclavonians have *ski*, the Swedes *ska*: the INOS, Lat. ENUS, Anglo-Saxon EN: the LICOS, Latin LIS, German LICH, English LIKE; thus *pelicos* is *what like*, at least in Scotland; the Mœso-Gothic *swaleiks* is our *such*; *sameleiks* is *similis*. LOS, LIS, LION, of diminutives, in Latin LUS, becomes in Mœso-Gothic ILO, as *barnilo*, a little child; in German *mannl* is a little man. Among the pronouns we have EGO in Greek and Latin, Mœso-Gothic IK, Icelandic EG, Swedish JAG; EMOU, MOU, Gr., Latin MEI, Mœso-Gothic MEINA, German MEINER; EMOI, MOI, Latin MIHI, Mœso-Gothic MIS, Swedish MIG, Dutch MY; EME, ME, Latin ME, Mœso-Gothic MIK, Anglo-Saxon ME, Dutch MY. Sü, Doric Tü, Latin TU, Mœso-Gothic THU. Is in Latin, Mœso-Gothic IS; EJUS, Mœso-Gothic IS, IZOS; ID, Mœso-Gothic ITA, English IT; QUIS, CUJUS, CUI, QUEM, Mœso-Gothic QUHAS, QUHIS, QUHE, QUHANA, the last having the N, as the Greek HON; UTER, WHETHER; ALTER, OTHER, seems to be derived from ANTHER, ENTHERA, meaning *one of them*, so that in this instance the Gothic has the appearance of the greater antiquity, while the Greek affords, on the other hand, an etymology for EKEINOS, from EKEI, *there*, which is wanting to the Mœso-Gothic GAINS or JAINS, the Alemannic GENER, the German JENER, and the English YON-

DER OR YON. Again, among the numerals, DEKA has been derived from DEO, as if both hands were tied together; and PENTE has a strong resemblance to PANTA, as if *all* the five fingers were reckoned: and, on the other hand, *da cuig* in Gaelic, meaning twice five, has been considered as the original of DECA. But none of these etymologies seems to be so decisive of originality as that of *caterva*, which is evidently related to *turba* or *turma*, while the first syllable remains unexplained in Latin; but in the Celtic we have *cad tarf*, or *cath tarf*, a *war troop*, agreeing undeniably with the sense. For another example, we may take *ventus* and *wind*, for which we find no Latin etymology, while the German furnishes us with *wehen*, to *blow*, and thence *wehend* and *wind;* the words *nodus* and *knot* afford also a similar instance, *nodus* having nothing nearer to it in Latin than *neo*, to spin, *necto*, to unite; but in German we have *knütten*, to join, and in English *knit* and *knead* from the same root. The degrees of comparison are expressed in Greek by EROS and ISTOS; in Anglo-Saxon by ER or ERA, and IST or AST. *Er* seems to mean *before*, as well as the Latin OR. The Coptic has no comparative, but for *better than I*, the Egyptians said *very good before me.* It would seem at first sight natural to make *than* a preposition, as well as *before*, and to say *better than me;* but the fact is, that in English, as well as in German, it was usual of old to say *then* or *denn* in this sense; and *he is wiser than I* meant only, *he is wise* BEFORE, THEN *I follow.* The idea of time or place is now dropped as unessential to the kind of priority in question, but the ground of the grammatical construction remains unaltered. In Mœso-Gothic the comparative termination is IZO or OZO, the superlative ISTS or ISTA; thus the Greek MEIZON becomes MEIZO, and MAISTS is obviously MEGISTOS. The old *megalos* is *mikils*, mickle or muckle; and *minor*, *minimus*, became *minnizo*, *minnists;* in Persian, *mih* is *great*, *mihter*, *greater*, *mihtras*, *greatest; better* seems to be from the old German *bied* or *bieder*, *upright*, *honest*, and resembles the Persian BIHTER, *better.* The Mœso-Gothic verbs have also some striking resemblances in their form to the Latin; thus the present tense of *to have* is HABA, HABAIS, HABAITH; HABAM, HABAITH, HABAND; HABUIT is HABAIDA; HABENS, HABANDS; HABENTIS, HABANDIS; HABENTEM, HABANDAM; HABENTES, HABANDANS. The substantive verb singular in Greek is EIMI, EIS, ESTI; the plural in Latin SUMUS, ESTIS, SUNT; the Mœso-Gothic has IM, IS, IST, SIJUM, SIJUTH, SIND; and SIS is SIJAIS; ESSE, WISAN. The Mœso-Gothic nouns frequently retain the resemblance of the Greek more strongly than their more modern derivatives: thus a TOOTH does not seem to point very immediately to DENTEM or ODONTA as its source; but the older form TUNTHU is clearly the intermediate stage of this modification; and numberless other instances of the same kind might easily be found.

The Germans were known, as early as the time of Pytheas, that is, 320 B. C. as consisting of the Jutes in Denmark, the Teutones on the coast to the east of them, the Ostiæans next, and lastly the Cossini, Cotini, or Goths. Professor Adelung imagines that the eastern nations, or Suevi, employed almost from the earliest times a high German dialect, and the western, or Cimbri, a low German; the Suevi he supposes to have been driven, at a remote period, into the south of Germany by the Sclavonians; and some of the Goths appear to have extended as far as the Crimea. The *Bible* of Ulphila, in the Gothic or Mœso-Gothic of 360, is the oldest specimen in existence of the German language. Besides the Greek and Latin, which appear to prevail so much in the language, it exhibits a considerable mixture of Sclavonian and Finnish; the translation is far more literal than it could be made in any of the more modern dialects of the German, and sometimes appears to follow the text with somewhat too much servility.

The modern *German*, founded on the higher dialects of Saxony, was fixed and made general by Martin Luther. There are many shades of dialect and pronunciation in the different parts of this diversified country, but none of them of any particular interest, or established by any literary authority. There are still some German colonies in the territories of Vicenza and Verona, called the Sette Comuni, which retain their language. The German Jews have a peculiar jargon, borrowed in some measure from their brethren in Poland, which they write in Hebrew characters; and another similar mixture of discordant dialects is spoken by the Rothwelsh, a vagabond people in the south of Germany, who have sometimes been confounded with the Gipsies.

The *Low Saxon*, or Platt Deutsch, is spoken about Halberstadt, and farther north, in the countries between the Elbe and the Weser; it seems to be intimately connected with the Frieslandish and Danish, as well as with the English. The *Frieslanders* originally extended from the Rhine to the Ems, and the Cauchi, thence to the Elbe; these countries still retain a dialect materially varying from those of their neighbours. The Brokmic laws of the thirteenth century exhibit some remarkable differences from the German of the same date: thus we find in them *Redieva*, a judge, or *Reeve*, instead of *Richter; Kenne*, *kin;* and *sida*, *side*, as in Swedish, instead of *seite*. The Batavian Frieslandish approaches very much to the English; it has several subdialects, as those of *Molkwer* and *Hindelop*. Some of the Cauchish Frieslanders remain in the territory of Bremen; the North Frieslanders occupy Heligoland, Husum, and Amröm.

The *Dutch* language is a mixture of Frieslandish, Low Saxon, and German, with a little French. It appears, from Kolyn's *Chronicle*, to have been distinctly formed as early as 1156.

The Scandinavian branch of the Germanic family is characterized by the want both of gutturals and of aspirates, which renders its pronunciation softer and less harsh; and by some peculiarities of construction, for instance, by the place of the article, which follows its noun, both in *Danish* and Swedish, instead of preceding it, as in most other languages. The name of Denmark is first found in the ninth century; until the sixth the people were called Jutes. *Norway*, in the ninth century, was termed Nordmanland. A corrupt Norwegian is still, or was lately, spoken in some of the *Orkneys*, which were long subject to Norway and Denmark. In the eastern parts of *Iceland*, the language is much like the Norwegian; but, on the coast, it is mixed with Danish. The oldest specimen of Icelandic is the *Jus Ecclesiasticum* of 1123. The term Runic relates to the rectilinear characters cut in wood, which were sometimes used by the Scandinavian nations. The *Swedes* are derived from a mixture of Scandinavians with Goths from Upper Germany, but their language does not exhibit any dialectic differences corresponding to this difference of extraction. Mr Townsend has given us a list, from Peringskiold, of 670 Swedish words resembling the Greek; but it must be confessed that the resemblance is in many cases extremely slight.

The *Saxons* are mentioned by Ptolemy as a small nation in Holstein, whence, in conjunction with the Frieslanders, and the Angles of south Jutland, they came over to England, about the year 450. The Saxons settled principally south of the Thames, the Angles north. At the union of the Heptarchy, the Saxon dialect prevailed, and the Anglish, which nearly resembled the Danish of that time, was less in use; but new swarms of Danes having inundated the north of England in 787, the Danish dialect was introduced by Canute and his followers; and it is about this period that our earliest specimens of the

Anglo-Saxon are dated. The Saxon dialect again obtained the ascendancy under Edward the Confessor; and although some French was introduced by this prince, and still more by William the Conqueror, into the higher circles of society, the courts of law, and the schools, yet the use of the French language never became general among the lower classes, and the Saxon recovered much of its currency in the thirteenth century, when the cities and corporate towns rose into importance, under Edward the First. In the fourteenth century it was permanently established, with the modifications which it had received from the French; and it may be considered as truly English from this period, or even somewhat earlier, at least if Pope Adrian's rhymes are the genuine production of 1156. It is still much more German than French; in the Lord's Prayer, the only words of Latin origin are *Trespass*, *Temptation*, and *Deliver*. Professor Adelung's remarks on the simplicity of the English language appear to be so judicious as to deserve transcribing. "The language," he observes, "only received its final cultivation at the time of the Reformation, and of the civil disturbances which followed that event; nor did it acquire its last polish till after the Revolution, when the authors who employed it elevated it to that high degree of excellence, of which, from its great copiousness, and the remarkable simplicity of its construction, it was peculiarly capable. It is the most simple of all the European languages; the terminations of its substantives being only changed in the genitive and in the plural, and the alterations of the roots of the verbs not exceeding six or seven. This simplicity depends in some measure on a philosophical accuracy, which is carried systematically through the whole language, so that the adjectives, participles, and article, are indeclinable, being in their nature destitute of any idea of gender, case, or number; and the form of generic distinction is [almost entirely] confined to objects which are naturally entitled to it. The pronunciation, on the other hand, is extremely intricate; and foreign proper names, in particular, are much mutilated whenever they are adopted by the English."

12. The CELTIC family forms a very extensive and very interesting subdivision of the Indo-European class. It has been asserted by some writers, "that the six original European languages, the Iberian, Celtic, Germanic, Thracian, Sclavonian, and Finnish, were just as distinct at the beginning of their history as they now are;" but this assertion must be subjected to considerable modification. The thing is in itself so improbable, as to require far more evidence than we possess to establish it, even if that evidence were of a more decisive nature; and, in fact, it will actually be found, upon a comparison of the Gothic of Ulphila with the more modern dialects, that the Germanic of that day did approach more nearly, both to the Celtic and to the Thracian or Greek, than any of its more modern descendants do. The change of TUNTHU into TOOTH, for which the Germans have ZAHN, has already been noticed; the ATTA and HIMINA of Ulphila seem to be more like the Irish At'air and Neamh, than the modern Vater and Himmel are; and the Mœso-Gothic VAIR, which answers to the Cimbric FEAR, a man, is not at present found in German, though its traces may still be observed in the *Firiobarno* of the Franks in 1020; the antiquity of the root is shown by the Celtic names in Cæsar beginning so often with VER, and still more strongly by the testimony of Herodotus, that the Scythian called a man AIOR. At the same time, therefore, that we admit the propriety of considering the Celtic and Germanic as families clearly distinct, with respect to any period with which we are historically acquainted, we must not forget that they exhibit undeniable traces of having been more intimately connected with each other, and with their neighbours, in the earlier stages of their existence. The resemblances of the Celtic to the Latin are too numerous to require particular notice, the immediate and extensive connection between these languages being universally admitted; but if any evidence were desired on this subject, it might be obtained in abundance, by a reference to Court de Gebelin's *Monde Primitif.* With respect to the Greek, the terms *Hael*, sun; *Dur*, water; *Deru*, oak; *Garan*, crane; *Crunn*, ice, are among the Celtic words of the most indisputable originality; and their resemblance to *Helios*, *Hüdor*, *Drüs*, *Geranos*, and *Crüoen*, is equally undeniable. We find, also, in the Cimbric, *Bas*, low, connected with *Bathüs*, *Bara*, bread, perhaps with *Bora*, food; *Deyrnas*, kingdom, with *Türannis; Dyro*, give, with *Doreue;* and *Gogoriant*, glory, perhaps with *Gauriaon*, exulting. With the German it is easy to find a number of very near approaches to identity, even in that Celtic which can be proved, principally from the etymologies of proper names, to be prior to the date of any known or supposed secondary intercourse or mixture of the natives concerned. Thus we have, either accurately or very nearly in the same signification, *Ap, Affe*, or *Ape; Barra, Barre; Bleun, Blume; Bolgan, Balge; Brig, Berg; Brogil, Brühl; Carra, Karre; Doga, Teich; Galb, Klab; Garan, Kranich; Gnabat, Knabe; Lancea, Lanze; Marc, Mähre; Marga, Märgel; Redya, Reiten; Rit* or *Rat, Rad;* and *Ur, Auer;* and it is impossible to suppose that so numerous a series of coincidences can have been derived from accidental causes only.

The Celts may be imagined to have emigrated from Asia after the Iberians or Cantabrians, and before the Thracians or Pelasgians, settling principally in Gaul, and spreading partly into Italy, under the name of Ausonians and Umbrians. In 570 B. C. they undertook expeditions for the purposes of conquest, but they were subdued by the Romans. Their language was current in Gaul till the sixth or seventh century, when it was superseded by the rustic Roman, which by degrees became French; in Ireland and Scotland it has remained with few alterations; in Wales and Brittany it has been more mixed. The Gauls must have peopled Britain at least as early as 500 B. C. The true ancient Britons are the Highlanders of Scotland only, having been driven northwards by the Cimbri: they still call their language Gaelic. The Irish are probably derived from these Highlanders; they were originally termed Scots or Scuits, that is, fugitives, from the circumstance of their expulsion from Britain; so that, where the Scots are mentioned before the tenth century, as by Porphyry in the third, we are to understand the Irish. Gildas, in 564, sometimes calls them Scotch and sometimes Irish. After the retreat of the Romans from Britain, a part of them re-entered Scotland about the year 503, and changed its name from Caledonia to Scotia Minor. In 432 St Patrick laid the foundation of the civilization of Ireland; and, in the seventh century, several Irish priests undertook missions to the continent. At the beginning of this century, some Scandinavian freebooters had begun to visit Ireland; and, in the year 835, they formed large colonies of emigrants, who established themselves firmly in that country, and in the Scottish islands, bringing with them many Gothic words, which became afterwards mixed with the Celtic, and which seem to constitute about one fifth part of the modern Irish and Gaelic, 140 Gothic words being found under the first six letters of the alphabet only. Some of these Normen remained distinct from the Irish till the year 1102. The oldest specimens of the Irish language, admitted by the continental critics to be authentic, are of the ninth century; though some of our antiquaries have imagined they have discovered records of a much earlier date. The Gaelic of the Isle of Man, is mixed with Norwegian, English, and Welsh. A Gaelic colony formerly established at Walden, in Essex, has been placed by Chamberlayne in Italy, as a nation of *Waldenses*.

The *Cimbric* or Celto-Germanic language was remarked by Cæsar as differing from the Gallic, although the distinction has not always been sufficiently observed. The Cimbrians seem to have existed as a nation 500 or 600 years B. C.; the Gauls called them Belgæ; the invaded Britain a little before Cæsar's time, and drove the ancient inhabitants into the Highlands and into Ireland. Having called the Saxons to their assistance against the Scots and Picts in the fifth century, they were driven by their new allies into Wales, Cornwall, and Brittany. Their language is remarkable for the frequent changes of the initial letters of its radical words in the formation of cases and numbers; thus, from *Den*, a man, in *Britannish*, is derived the plural *Tud;* from *Vreg*, a woman, *Groages*. Almost half of the Welsh language seems to be German, and half of the remainder is perhaps Latin or Celtic; of the Britannic, about half resembles the Latin or French. Brittany was originally inhabited by the Armoricans; whether they were properly Belgæ or Gauls is uncertain. The country was named Britannia Minor, from the emigration of the British in 449; these new comers mixed with the original inhabitants, all speaking the same language, and in a few years became so numerous, as to be able to send an army of 12,000 men to the assistance of the Emperor Anthemius.

Professor Adelung is disposed to consider the German portion of the different branches of the Celtic, which varies from one fifth to one half of the whole language, as an accidental mixture, and derived through different channels. But we cannot in all cases find any historical evidence of the existence of these channels; it is difficult, for example, to suppose that the Scandinavian incursions were able at any early period to influence the language of the Highlands of Scotland; and wherever it happens, as it frequently does, that no term is to be found, in the Irish, the Gaelic, or the Welsh, for expressing the same idea, besides the word that they all have in common with the German, it is scarcely possible to believe that there ever was any other Celtic word, which has been so uniformly superseded by independent causes. We find, for instance, under the two first letters of the alphabet only, the words *Ap* or *Apa* in Irish, *Ap* in Welsh, *Affe* or *Ape* in Gothic; again, *Abal, Afal, Apfel; Angar, Aneang, Enge; Bacail, Bach, Backen; Barrad, Barr, Bare; Beoir, Bir, Bier; Biail, Bwiall, Beil; Bocan, Bwch, Bock; Brathair, Brawd, Bruder; Bul, Bwla, Bulle;* and the same agreement is found in almost all other instances of German words that are detected in the Irish language.

The much-disputed question respecting the antiquity of the poems attributed to Ossian has an immediate reference to the history of the Celtic languages. It has been observed, with apparent justice, by Professor Adelung, who is not in general sceptical on such occasions, that if these poems were really very ancient, their language could not but exhibit marks of antiquity. There is an Irish *Leavre Lecan* at Paris, written in the thirteenth century, and scarcely intelligible to the best Irish scholars of the present day; the oldest Gaelic manuscripts have also peculiar expressions no longer in use; while the works supposed to be the productions of a period so much more remote are found to be in "excellent modern Gaelic, impressed with all the marks of the language of Christianity, and of that of the Norwegian invaders, whether these conquerors may be supposed to have influenced the Gaelic language immediately in Scotland, or by the intervention of Ireland." It must not, however, be forgotten, that these marks of Scandinavian intercourse are somewhat more ambiguous than Professor Adelung is disposed to admit; and that a book written in the thirteenth century is more likely to have preserved the language in an antiquated form than poems so marvellously committed to memory from continual recitation only, by people supposed to understand them, and of course imperceptibly modifying the expressions without intending to alter them. But since an invasion from Lochlin, that is, Denmark or Norway, is actually mentioned in "Fingal," the author of the poem could certainly not have been older than the seventh or eighth century, if we are to credit the historical accounts of these invasions; and since, in the poems discovered by Dr Matthew Young, St Patrick is introduced discoursing with Ossian respecting the Christian religion, we have an additional argument for denying that he was contemporary with Caracalla or Carausius, these emperors having both lived in the third century, and St Patrick in the fifth.

14. The ETRUSCAN is only known as the immediate parent of the Latin; but it was written in a character totally different, and was read from right to left. Notwithstanding the industry and ingenuity of Lanzi, the evidence of the accuracy of his interpretations is somewhat imperfect. We should naturally have expected to find more words of a Celtic or Gothic origin, and not merely Greek or Latin words with the terminations a little varied, as *Ustite* for *Ustura, Tribo* for *Tribus*, and *Urte* or *Urta* for *Heorte;* still less should we have expected that the same sense should be expressed sometimes by a Greek and sometimes by a Latin word, as *Urtu* and *Puni* for Bread, *Capros* and *Feres* for a Boar. The Etrurians and Umbrians were originally a branch of the Celts from Rhætia, as is shown by the similarity of the names of places in those countries, as well as by the remains of Etruscan art found in that part of the Tyrol; they are supposed to have entered Italy through Trent, about the year 1000 B. C., and to have afterwards improved their taste and workmanship under the auspices of Demaratus of Corinth, who settled in Etruria about 660 B. C. (See ETRURIA and ETRUSCANS.)

15. The LATIN language is placed at the head of a family, rather with regard to the number of its descendants than to the independence of its origin, being too evidently derived from the Celtic, mixed with Greek, to require particular comparison. The first inhabitants of Italy appear to have been Illyrians or Thracians, Cantabrians, Celts, Pelasgians, and Etrurians. Rome, from its situation, would naturally acquire much of the languages of these various nations, and at the same time much of the Greek from the colonies in the south of Italy. In the time of Cicero, the Italian songs, supposed to be about 500 years old, were no longer intelligible, even to those who sang them. We find, in an inscription still more ancient, and approaching to the time of Romulus, *Lases* for *Lares;* and for *Flores, Pleores*, which is somewhat nearer to the Celtic *Bleun*. In the time of Numa, for *Hominem liberum*, we have *Hemonem lœbesom;* we find, also, a D added to the oblique cases, as *Capited* for *Capite*, which, as well as the termination AI, in the genitive *aulai, pennai*, is taken immediately from the Celtic, and is even found in modern Gaelic.

The Latin remained in perfection but a few centuries. In the middle ages, a number of barbarous words were added to it, principally of Celtic origin, which are found in the glossaries of Dufresne and Charpentier. At the end of the seventh century it began to acquire the character of *Italian*, as *Campo divisum est;* and, in the eighth century, in Spain, we find, as an example of its incipient conversion into Spanish, *Vendant sine pecho, de nostras terras*. The formation of the Italian language may be said to have been completed by Dante, in the beginning of the fourteenth century; and it was still further polished by the classical authors who immediately succeeded him. It contains many German words, derived from the different nations who occupied in succession the northern parts of Italy, and some Arabic, Norman, and Spanish, left by occasional visitors in the south. It is spoken by the common people in very different degrees of purity. Among the northern dialects, that of *Friuli* is mixed with French, and with some Sclavonian. The *Sicilians*, having been conquered in succession by the Greeks, Carthaginians, Romans, Byzantines, Arabs, Normans, Germans, French, and Spaniards, have retained something of the language of each. *Sardinia* has given shelter to Iberians, Libyans, Tyrrhenes, Greeks, Carthaginians, Romans, Vandals, Byzantines, Goths, Lombards, Franks, Arabs, Pisans, and Aragonians; and the proper Sardinian language is a mixture of Latin with Greek, French, German, and Castilian. Corsica has also been occupied by a similar diversity of nations; its peculiar idiom is little known, but the dialect of the upper classes is said to approach nearly to the Tuscan.

Spain, after its complete subjugation by the Romans, enjoyed some centuries of tranquillity. The Vandals and Alans retained their power in Spain but for a short time; the Suevi, on the north coast, somewhat longer; and from these nations the rustic Roman, which had become general in Spain, received some words of German origin. It derived, however, much more from the Arabic during the domination of the Moors, which lasted from the beginning of the eighth century to the end of the fifteenth; and, at one time, the Arabic was almost universally employed throughout the country, except in the churches. The *Spanish* language advanced the most rapidly toward perfection during the height of the national prosperity, which immediately followed the conquest of America. It was afterwards neglected, and again more particularly cultivated by the Academy of Madrid, in the eighteenth century; as far at least as an academy can be supposed to have any influence in the modifications of a language.

The *Portuguese* is supposed to have received a mixture of French from the followers of Count Henry of Burgundy, under whom Portugal first formed a separate state in 1109; but the language is very different from that of the confines of France and Spain; and the nasal vowels, which are remarkable in the Portuguese, differ materially from those of the French, or of any other nation. Many Latin words are retained in the Portuguese which are not found in any other modern language; and it is remarkable that almost all the words of the language are contracted, by the omission of some of the radical letters of the originals.

The Rhætians, in the country of the Grisons, were subdued by the Romans in the time of Augustus. They became part of the Alemannish kingdom, under Theodobert, in 539; their union with Switzerland took place in the beginning of the fourteenth century. Half of the Grisons speak the *Romanish* language, immediately derived from the Latin, though mixed with some German, which has been particularly made known by Mr Planta's account of it in the *Philosophical Transactions.* One third speak German, with some mixture of Romanish words, and the rest a bad Italian.

France, in the time of the Romans, was occupied by the Gauls, together with the Aquitanians, who were probably Cantabrians, and the Cimbrians or Belgians. From the rustic Roman, mixed with the languages of these nations, the *Romance* was gradually formed. In the fifth century, the Franks took possession of the north-eastern part of the country. They retained their language for some centuries, but by degrees it became mixed with the Romance, and formed *French*, of which at least one fifth is supposed to be of German origin, though many of the German words seem to have been admitted through the medium of the Italian. In the south of France, the language remained more exempt from the influence of the German, under the name of the *Provençal;* and the troubadours contributed, especially from the eleventh to the thirteenth century, to give it refinement and currency; but, in later times, the *Langue d'oui* has prevailed over the *Langue d'oc*, which is now spoken by a few of the lowest class only.

The last and least genuine of the descendants of the Latin is the *Wallachian*, about one half of which is borrowed from the German, Sclavonian, and Turkish. The original Thracians of the country must have been in a great measure superseded by the successive settlements of various nations; in the third century, some of the Goths and Vandals; in the fourth, the Jazyges, after Attila's death; in the fifth, some Huns and Alans; about the end of the seventh, the Bulgarians, and afterwards the Petschenegers and Hungarians, established themselves in it; and, in the thirteenth century, Wallachia became an independent state. The Latin part of this language has much of the Italian form, and had even assumed it as early as the fifth century. It must have been derived from Roman colonies, and more lately, perhaps, from the missionaries sent into the country by Pope Gregory XI. The *Dacian* or Hungarian dialect prevails on the north of the Danube; the *Thracian*, or Cutzo-Wallachian, on the south; the latter is more mixed with Greek and Albanian. There is also a small Wallachian colony in Transylvania.

The *Cantabrian* or *Biscayan* has many words in common with the Latin, whether originally or by adoption, and was probably in some measure connected with the Celtic dialects, which were the immediate predecessors of the Latin, though still sufficiently distinct from them. The Cantabrian *Aita*, Father, has some resemblance to the Irish *At'air*, and the Mœso Gothic *Atta;* *Geru* is not wholly unlike *Cœlum;* *Ereenjaa*, *Regnum;* and *Borondatia*, *Voluntas;* the coincidence of *Gun*, Day, with the Tartarian, is perhaps more accidental. But the word *Lurre*, Earth, which seems at first sight so unlike any other language, is in all probability the derivative of *Tellure;* and this form of the word affords also a connecting link with the Irish *Talu*, and may have been contracted into the more common Latin word *Terra;* a supposition which seems to lessen the probability of the original connection of this form of the word with the Greek *Era*, and the Sanscrit *Stira*. The Biscayan is still spoken in the angles of France and Spain adjoining to the northern extremity of the Pyrenees. The same people were called Cantabrians in the north, and Iberians in the south, and extended between the Pyrenees and the Rhine, as Ligurians, or inhabitants of the coast. They have adopted a few German words, perhaps from the empire of the west Goths; and they have furnished the modern Spanish with more than a hundred original words of their own. The construction of the language is extremely intricate; its verbs have eleven moods, among which are a consuetudinary, a voluntary, a compulsory, and a penitudinary. Larramendi's *Grammar*, published at Salamanca in 1729, is called *El Impossible Vencido.* A valuable abstract of the most interesting particulars relating to the language is found in the Additions to the Mithridates, by the Baron William von Humboldt, late Prussian ambassador to the court of Great Britain, printed at Berlin 1816. Dr Young has lately remarked, in the *Philosophical Transactions* for 1819, that at least six of the words contained in Humboldt's vocabulary coincide very accurately with the Coptic, or ancient Egyptian, though they are not found in any of the languages of the neighbouring countries; and he infers that the chances are "more than a thousand to one, that, at some very remote period, an Egyptian colony established itself in Spain." It may be observed, that one of these words, *guchi*, little, appears to be also Turkish or Tartarian; so that it becomes a second instance of a coincidence between this language and the Cantabrian.

16. The connection of the Sclavonian and Lithuanian, and of the other branches constituting the SLAVIC family, with the languages of the Indo-European class in general, is sufficiently established, without exceeding the limits of the Lord's Prayer, by the resemblance of *Nebi* or *Nebesi* to the Cimbric *Nefoedd*, and the Greek *Nephos*, and of *Wolja* and *Chljeb* to the Gothic *Wilja* and *Hlaif*. The *Sclavonians* are the descendants of the ancient Sarmatians, who were situated north of the Black Sea and of the Danube. They were conquered by the Goths, and then driven by the Tartars and Huns into the north-east of Germany, and the neighbouring countries. Procopius calls them Spori, and divides them into the Sclavi and Antes, the latter, perhaps, the same as the Wends. They formed, at an early period, two principal states, Great Russia, about Novogorod, and Little Russia, on the Dnieper, its capital being Kiew. The Russi were a Scandinavian branch, under Rurik, to whom the Sclavonians of the former state submitted in 862, whence they were called Russians; and Rurik's successor, Oleg, conquered Kiew. After several vicissitudes, the Russians were liberated by Iwan Wasiliewitch, at the end of the fifteenth century; and this period was the beginning of their greatness. Their language has some mixture of Greek, Finnish, Swedish, Tartarian, and Mongol. The ecclesiastical dialect was uniformly retained in all literary works in the former part of the last century, but now the language of conversation is generally adopted in writing. This language is more immediately derived from that of Great Russia; that of the church, which is called the Slawenish, rather from Little Russia, and especially from the dialect of Servia. The *Malo-Russian* dialect is somewhat mixed with the Polish, and is spoken in Ukraine and Little Russia; the *Susdalian* is mixed with Greek and other languages, and is spoken in Thrace.

In 640, the Sclavonians took possession of Illyria, which before that time had been overrun by a variety of other nations; and they still retain it, under the names of Servians, Croatians, and Southern Wends. The *Servians* are supposed to have come from Great Servia, now East Gallicia, on the Upper Vistula; the *Croatians* from Great Chrobatia, probably situated on the Carpathian Mountains. Cyril first adapted the Greek alphabet to the Sclavonian language in Pannonia; his letters were afterwards a little altered, and attributed to St Jerome, in order to reconcile the people to their use; and in this form they are termed Glagolitic characters. The Servian dialect is intermediate between the Russian and the Croatian. The Bulgarians speak a corrupt Sclavonian, which Boscovich, from *Ragusa*, could scarcely understand. The *Uskoks* are a wild race of the Bulgarians, extending into Carniola, and speaking a mixed language. The dialect of Sclavonia and Dalmatia is nearly the same as that of Servia and Bosnia; the churches use the ecclesiastical language of Russia. In Ragusa, the orthography approaches, in some measure, to the Italian. The Servian is also imperfectly spoken by a small colony in Transylvania. The Southern *Wends* were first distinguished in 630, and were probably so named, like the Veneti, from being settled on the shores of the Adriatic, the word *Wend* or *Wand* meaning Sea. They are now mixed with Germans in Carniola, Carinthia, and Lower Stiria. In Hungary there is a small colony, who call themselves Slowens, and speak the *Wendish* dialect of the *Sclavonian*. The western Sclavonians, or the proper Sclavi, write their language in the Roman characters; but the specimens copied from Adelung are accommodated in their orthography to the German mode of pronunciation.

The *Poles* probably came with the Russians from the Danube into the countries abandoned by the Goths; the name Pole implies an inhabitant of plains. Their language was partly superseded by the Latin in the tenth century, when they received the rites of the Latin church; but it has in later times been more cultivated. The Cassubians, or Kashubians, in Pomerania, speak a Polish mixed with a little German. In Silesia, the names of places in the plains are Sclavonian; in the hills, more lately occupied, German; but German has been the language of Breslau ever since the year 1300.

The *Bohemians* emigrated with the Moravians and Slowaks into their present habitations about the middle of the sixth century, after the destruction of the kingdom of Thuringia by the Franks and Saxons. There is a Bohemian hymn of the date 990, and a chronicle in rhyme of 1310. One third of the Bohemians are of German origin, and speak a corrupt German.

The *Serbs* or Wends came about the same time into the countries between the Saal and the Oder, from the neighbourhood of the Volga or the Crimea; a few of them are still left in *Lusatia*, under the name of Wends or Sclavonians, and some in Misnia. In Pomerania the Wendish became extinct about 1400: but the *Polabes* in Lüneburg, on the Leyne, kept up till lately a language consisting of a mixture of Wendish and German. The *Sorabic* of the Russian vocabulary seems to be the same with this Serbian.

Of the *Lithuanian* or *Lettish* language, two thirds are Sclavonian, the rest is principally German. When the Goths had removed from the Baltic towards the Black Sea, their neighbours the Æstii remained for some hundred years independent, till, in the sixth century, the Sclavonians incorporated themselves with them, and formed the Lettish people and language. The *Old Prussian* was spoken, at the time of the Reformation, in Samland and its neighbourhood, but it is now lost; it contained more German than the other Lithuanian dialects. The *Prussian Lithuanian* is spoken from the Inster to Memel, especially in Insterburg. The *Polish Lithuanian*, in Samogitia, has a little mixture of Polish. The proper *Lettish* is current in Lettland and Courland; it is purest about Mittau and Riga; the old Courlanders having been Fins, this dialect has received a little Finnish from them. The *Crivingian* is another dialect, spoken by the Krewins in Courland.

17. The Tshudish or Finnish, the Hungarian, and the Albanian languages, have some traits of resemblance to each other; they are placed as forming the *sporadic* or scattered order of the great *Tataric* or Asiatic class, being in some measure geographically detached from the rest, and scattered through different parts of Europe; they immediately follow the Indo-European class, as exhibiting an occasional resemblance to some of the languages contained in it, though not enough to make it certain that the connection is essential or original. Thus the Finnish is said to have some coincidences with the Greek, the Laplandish with the Hebrew, the Hungarian with the Finnish, and the Albanian with all its neighbours.

The term *Tshudish* is employed as comprehending the Fins, Laplanders, Esthonians, and Livonians; a race of people of unknown origin, but in all probability unconnected with the Huns or Mongols. Their languages are remarkable for the great complexity of their structure; their nouns, for example, having from ten to fifteen cases, among which are reckoned, in the Finnish, a nuncupative, a conditional accusative, a factitive, a mediative, a descriptive, a penetrative, a locative, a privative, and a negative. The Esthonian has less direct variety of termination, but several intricate combinations. There is also a great multiplicity of dialects, partly from a mixture of Scandinavian, and partly from other causes; in Lapland, almost every church has a peculiar version of the service kept for its use. The *Finnish* is intermediate between the *Laplandish* and the *Esthonian.* The Esthonians are the Æstii of the Romans, the name implying Easterly, and being appropriate to the country, and not to the people. The principal dialects of their language are those of Reval and of Dorpat; some authors also consider the dialect of the Krewins in Courland as belonging to it. The *Livonian* is much mixed with other languages, and has been almost superseded by the Lettish. Amongst the Laplandish words which Rudbeck has derived from the Hebrew, we find *Aedhame*, Earth, like the Hebrew *Adameh; Hadas*, New, H. *Khadesh; Hadshe*, the Moon, H. *Hhadesh; Jed*, the Hand, H. *Id; Ise*, Man, H. *Ish; Pothi*, persuaded, H. *Pathehh; Saedke*, Law, H. *Tzedek;* and *Safothi*, Rested, H. *Sabbath.* In the Finnish, *Kana* is something like the English and German *Hen.*

18. The *Hungarians* inhabited, in the fourth century, the country of the Bashkirs, between the Tobol, the Volga, and the Jaik, perhaps as colonists, since their name signifies strangers. Their language was spoken in this neighbourhood as late as the thirteenth century; in the sixth they were conquered by some of their Turkish neighbours; in the end of the ninth they were forced by the Petschenegers, a Tartarian nation, to remove nearer to the Carpathian Mountains. They were then engaged in the German wars, and their country having been occupied during their absence by the Bulgarians, they took possession of the Bulgarian kingdom on the Theiss, as well as of Pannonia. Their language is somewhat like the Finnish, but the people are very different from the Fins in appearance; which might indeed be the effect of a difference of climate; but, in fact, the language appears to be still more like the Sclavonian, with a mixture of a multitude of others; it has some words from various Tartarian dialects, German, French, Latin, Armenian, Hebrew, Persian, and Arabic; but it has no traces of the Mongol, nor is it possible that the people can be descendants of the Huns, whose character and cast of features can never be eradicated. The word *Coach*, so general in Europe, is originally Hungarian, having been derived from the town of *Kots*, where coaches are said to have been invented. The Szecklers, in Transylvania, speak a language like the Hungarian; it is uncertain whether they are a Hungarian colony, or remains of the Petschenegers; but, however this may be, there is little doubt that the Hungarians are principally of Tartarian extraction, though much mixed with other nations.

19. The *Albanians* speak a language, of which a considerable portion is Greek, Latin, German, Sclavonian, or Turkish; but the rest seems to be perfectly distinct from any other language with which we are acquainted. They are probably connected with the Albanians between Mount Caucasus and the river Cyrus, who are supposed to be derived from the Alani; some of them seem to have entered Bulgaria as late as 1308. In 1461, many of them fled from the Turks to *Italy* and *Sicily*, where they still exist near Reggio and Messina. The Clementines are an Albanian colony, who followed the Austrian army in 1737; such of them as escaped from the pursuit of the Turks established themselves in Syrmia.

20. The languages referred to the *Caucasian* order have little to distinguish them from the rest of the class, except their geographical situation, in the immediate neighbourhood of the Caucasian Mountains. They have a general resemblance to some others of the languages of Northern Asia, and particularly to the Samojedic dialects, spoken on the mountains between Siberia and the Mongols. Except the Armenian and Georgian, they are scarcely ever employed in writing; and principally, perhaps, from this cause, they exhibit as great a diversity, in the space of a few square miles, as those of many other nations do in as many thousands. It is only conjectured that most of the inhabitants of these countries are derived from the miscellaneous fragments of expeditions of various nations, left behind in their passage through them at different periods.

The connection of the *Armenian* with the Sanscrit and the Persian, is just enough to make it equally possible that the coincidences may have been derived from a common parent, or that one language may have simply borrowed detached words from the other. We find, in different parts of Mr Townsend's work, about ten Armenian words resembling some other language; these are, *Air*, a man, *Air*, Irish; *Atamn*, a tooth, *Odonta*, Greek; *Chuerk*, four, *Chatur*, Sanscrit; *Dor*, a door; *E*, is, *Est*, Latin; *Es*, I, *Iaze*, Russian; *Gas*, a goose, *Gans*, German; *Houze*, a house; *Lakeil*, to lick, *Leichein*, Greek; and *Sirt*, the heart. Nothing is known of the history of the Armenian before the time of Miesrob, who translated the Bible into it, in 405; the historian Moses, of Chorene, was his pupil. The language flourished till the year 800, and is still preserved in tolerable purity in the cloisters. The common people speak a dialect more corrupt and mixed. The fathers of the Armenian convent at Venice have been very laudably employed in the improvement of the literature of their nation, by the publication of several very elegant editions of Armenian books, which have been executed at their press; in particular, of an Armenian translation of Eusebius, containing some passages which are not extant in Greek, and said to have been copied from a manuscript of great antiquity at Constantinople. It is, however, very remarkable, that, as they candidly confess, the copy, when first received by them, contained the corrections and additions of Scaliger, in conformity with the text of the printed Greek edition; and the copyist, when questioned, asserted that he had merely translated and inserted passages of his own accord, and in silence, in order to make the work more perfect. Still the Armenian Eusebius is a very handsome book, and every way calculated to do credit to the Venetian editors and their patrons; a Latin translation of it only has been published by Angelo Mai at Milan.

21. The *Georgians* are supposed to have derived their name from the river Cyrus or Gur, and to have extended formerly to Colchis, under the denomination of Iberians. Moses of Chorene, in the fifth century, mentions the Georgian translation of the Bible. The old language is still preserved in the churches, and the common dialect of the country is derived from it, together with the *Kartuelish*, *Imirettish*, *Mingrelish*, and *Suanetish*, which are varieties of that dialect; the *Tushetish* is mixed with some Kistic. The Georgians have no fewer than thirty-seven letters, and among them a variety of aspirates and sibilants, of no very agreeable sounds.

22. The ABASSIC nations seem to be the oldest inhabitants of the Caucasian country. 23. The CIRCASSIANS are situated to the east of them, on the promontory of North Caucasus. 24. The OSSETES, on the left of the Terek, north of the mountain; the dialect of the *Dugors* is scarcely distinguishable from this. 25. The KISTIC, spoken by the *Ingushans*, and their neighbours at the head of the Terek, is connected with the Tushetic Georgian. 26. The LESGIANS, east of Caucasus, on the Caspian Sea, have a number of distinct dialects, or rather languages. Thus, the *Chunsag* and *Avaric*, the *Dido*, the *Kasi Kumük*, the *Andi*, and the *Akushan*, have little connection with each other, except that the Dido somewhat resembles the Chunsag, of which the Avaric, the *Antsug*, and the *Dzhar*, seem to be subordinate dialects. The Kasi Kumük appears to have adopted some words of the Armenian, and the Andi and Aku-

shan of the Georgian. The dialect of Kubesha resembles that of Akusha, and retains no traces of a supposed European origin.

27. The languages of the central and elevated parts of Asia are comprehended in the order *Tartarian;* they extend from the Caspian Sea to the mouth of the Amur, through countries which have been, in former ages, the constant scenes of emigration and barbarism. The *Turco-Tartarians* are supposed to correspond to the descendants of the Magog of the Scriptures, and to some of the Scythians of the Greeks. The Turks of Turkestan seem to have been the Massagetæ and Chorasmii of the ancients; their country extended north of Persia and Thibet, from the Caspian to the Altaic Mountains. In the twelfth century they wrae brilliant and victorious; at present, a few of their descendants only are left in the neighbourhood of the Mongols, and their language is no longer spoken; the Turcomans scattered in Persia and Arabia are derived from the same race. The Osmans, now commonly called Turks, left Turkestan in 545, and succeeded in the conquest of Persia. They were denominated Osmans, from one of their leaders, in the fourteenth century. Their language has been much mixed with Arabic and Persian. This language, with the neighbouring dialects, has been considered in the table as belonging to a family called *Caspian*, the word Tartarian having been previously applied to the whole order. Several of these dialects exhibit a mixture of words from the language of the Mongols, which, as well as the Calmuck, has a sufficient connection with them to be arranged as belonging to the same Turco-Tartarian family. It would, perhaps, be equally correct to consider some of them rather as distinct languages than as dialects of a single one; but it is not easy to discriminate those which are entitled to this rank; and, on the other hand, some specimens have been admitted, from the Comparative Vocabularies, which scarcely deserved to be noticed as separate dialects. The *Bucharians* are situated between the Oxus and Jaxartes, on the river Koly. They still retain some traces of a superior degree of civilization, by which they were once distinguished. Their language is little known, but it seems to be at least as much connected with the Median and Arabian families as with the Caspian. The Tartars were described by the terms Scythians, Bulgarians, Avari, and other appellations, before they were conquered and united by Genghiz Khan the Mongol. In the year 1552 they became subject to the Russians. The most westerly are the Nogaic or Nagaic and Crimean Tartars; their language is much like the Turkish, but mixed with some Mongol. Those of Cumania in Hungary have now forgotten their original language, and speak the Hungarian, the last person who understood the Cumanian having died in 1770. They entered Hungary in 1086, and became Christians in 1410. The Tartarian, or rather Caspian, is spoken in great purity about Kasan; a dialect somewhat different in Orenburg; and another by the *Kirgishes*, who occupy part of the ancient Turkestan. "Among the Siberian Tartars, the remains of the kingdom of Turan, some are Mahometans; others, as the Turalinzic villagers, have been made Christians; at least the Archbishop Philophei performed the ceremony of baptizing them, by ordering his dragoons to drive them in a body into the river." The inhabitants of the banks of the *Tara*, a branch of the Irtish, are said to be derived from the Bucharians. The *Tshulimic* Tartars enjoy the same advantage as the Turalinzic, and are considered as Christians by the Russians. The *Teleutes*, in Sonjor, are heathens, nearly like the Shamanites of India. The *Jakuts* extend along the Lena to the sea; their language contains some Mantshuric and some Tungusic. That of the Tshuwashes, on the Volga, is said to have been once completely distinct from the Tartarian or Caspian; and even at present, though more mixed with it, may require to be classed as forming a separate species.

The *Mongols* are marked by their features as a race very different from the other Tartars; the character of their countenance seems to be easily propagated from father to son, and never to be completely effaced; their original habitation appears to have been in the neighbourhood of the Altaic Mountains. The description of the Huns, found in Ammianus, Procopius, and others, agrees exactly with the present Mongols, whom the Chinese still call *Kiong nu;* and more particularly with the Calmucks. The proper names of the Huns are also found to be explicable from the Mongol language. In the first century they were driven westwards by the Chinese: under Attila they penetrated into the middle of Europe; and they were little less successful at subsequent periods, under Genghiz Khan and Timur Leng. When they were expelled from China, after having held it in subjection for more than a century, they carried back no civilization with them; nor was either of the languages permanently affected by this temporary mixture of the nations, although the physiognomy of the Chinese bears ample testimony of its having once existed. The construction of their language seems to be very indirect and figurative. Mr Townsend has copied from General Vallancy a long list of words, in Strahlenberg's *Mongol Vocabulary*, which agree very remarkably with the Irish; among these we find *Are* and *Ere*, man, Irish *Ar*, *Air*, *Fear;* *Arul*, a spindle, Irish *Oirle;* *Alemamodo*, an apple-tree, Irish *Amhalmhaide;* *Asoc*, to ask, Irish *Ascadh;* *Baiehu*, I live long, Irish *Baoth*, long life; *Bugu*, a buck, Irish *Boc*, a he goat; *Choy*, a ewe, Irish *Choi;* and *Choraga*, a lamb, Irish *Caorog;* without going any further in the alphabet. The last two instances are very striking, and seem to point very strongly at that part of the east from which the Celts may be supposed to have originally emigrated. The *Calmuck* dialect is somewhat mixed with the neighbouring Tartarian. The Tagurians, or Daurians, between the lake Baikal and the Mongol Hills, are said to be of Mantshuric origin; but their language evidently resembles the Calmuck. The *Burattish* is from the Russian Vocabularies.

28. The *Mantshurians* are sometimes improperly called Eastern Mongols; they are subjects of the empire of China. Their language is rude, and not much like the Chinese, though evidently derived from the monosyllabic class. It has some few words in common with the European languages, as *Kiri*, patient, *Kirre*, German, *Cicur*, Latin, tame; *Furu*, *Furor;* *Lapta*, rags, *Lappen*, German; *Sengui*, blood, *Sanguis;* *Ania*, a year, *Annus*; but, considering the remoteness of their situation, we can scarcely form any conclusion from the occurrence of these resemblances. M. Abel Rémusat held the appointment of professor of this language at Paris; but it was found difficult for him to render its study very popular in the midst of so busy a metropolis. Whether the language of the island of *Sagalien*, opposite to the mouth of the Amur, is a dialect of the Mantshuric, or totally distinct, and requiring to be classed with the insular languages, appears to be not yet sufficiently ascertained. The *Corean* has been supposed to be a mixture of Mantshuric and Chinese: the Coreans do not understand either of those languages when they are spoken, but this fact is perfectly compatible with the supposition.

29. The *Tungusians*, in the east of Siberia, subject to the Chinese, speak a peculiar language, mixed with some Mongol. The Russian vocabularies contain specimens of a variety of their dialects, besides those of the Tshapogirs on the Jenisei, and the Lamuti on the Sea of Ochotsk, none of them particularly interesting or remarkable.

30. The languages belonging to the *Siberian* order occupy the principal part of the north of Asia, between the mountainous Tartarian territory and the Frozen Sea. At the commencement of this order, we find a variety of in-

considerable nations in the neighbourhood of the confines of Europe and Asia, which have their distinct languages, probably formed, in times comparatively modern, out of the fragments of others. They have almost all of them some Finnish words, but none a sufficient number to justify us in considering them as dialects of the Finnish language, although the people were very probably connected with the Fins as neighbours, in the middle ages, on the banks of the Dwina and elsewhere. The *Sirjänes,* in the government of Archangel, speak nearly the same language with the *Permians,* who are partly in the same government, and partly in that of Kasan. The *Wotiaks,* on the Wiatka, also in Kasan, have a dialect which seems to be intermediate between the Permian and the Tsheremissic. 31. The *Woguls,* situated on the Kama and the Irtish, afford specimens of several dialects in the Russian collection; they seem to have borrowed a few words from the Hungarian, and much more from the language of the *Ostiaks* (32), who are also divided into several races. 33. The *Tsheremisses,* situated on the Volga, in Kasan, have a little mixture of Turco-Tartarian. 34. The *Morduins,* on the Oka and Volga, have about one eighth of their language Finnish, and also some Turco-Tartarian words. The *Moktanic* is a dialect differing but slightly from the Morduin. 35. The *Teptjerai* are people paying no taxes, who originated from the relics of the Tartaro-Kasanic kingdom in the sixteenth century, and who are said to speak a language peculiar to themselves. The arrangement of all these dialects must remain very imperfect, for want of a greater number of specimens of their peculiarities.

36. The *Samojedic* nations are situated north of the Tartars, by whom they may possibly have been driven into their present habitations. Their languages seem to have some affinity with the Caucasian and Lesgian dialects, and some of them with the Wogulic and Ostiak families; the specimens in the Comparative Vocabularies seem to have been multiplied somewhat too liberally. 37. The *Camashes* are situated on the right of the Jenisei; they are Shamanites or Buddists; their language seems to be a mixture of several others, and is divided into several very distinct dialects. The *Koibals* have been baptized; they have borrowed some words from the Turco-Tartarian family. The *Motors* are situated on the Tuba. 38. The Ostiaks on the river Jenisei afford us five specimens of languages totally different from those of the Ostiaks already mentioned, but nearly connected with each other, so that they may properly be called *Jenisei-Ostiaks.* 39. The *Jukagirs,* or *Jukadshirs,* are few in number; they are situated between the Jakuti and the Tshutshi; they have some Jakutish words mixed with their language, and some Tsheremissic. 40. The *Koriaks* and the *Tshutshi* occupy the north-easternmost point of Siberia; the proper Koriak is spoken on the bay of Penshin; the *Kolymic* on the river Kolyma, the *Tigilic* on the Tigil in Kamtschatka, and the *Karaginic* on the island Karaga; the Tshutshic has been considered as a dialect of the Koriak. 41. The *Kamtschatkans* are a little further south; the *Tigilic Kamtschatkan* is found, however, on the north of the Tigil; the *Srednish* to the west, on the Bolshaia, and the *Jozhnyshic* on the river Kamtschatka, and towards the South Cape. The languages of the neighbouring parts of America, according to Professor Vater, greatly resemble the Tshutshic.

The *Insular* order of the Tataric or Atactic class of languages must be understood as comprehending all the Asiatic islands east of Borneo. 42. The language of the *Curilees* is spoken not only in the principal of these islands, but also in Kamtschatka, about Cape Lopatka; but in some of the islands the Japanese is spoken. The *Japanese* derive themselves from the Chinese, but their language contradicts this opinion; they have evident traces of Mongol extraction or relationship. The amiable islanders of *Loochoo* will long be remembered by the British public, for the hospitality they showed to the Alceste and the Lyra; their language appears to be related to the Japanese, as might be expected from their situation. *Formosa* was conquered by the Dutch in 1620, but in 1661 it was taken from them by a Chinese pirate: the next year some books were printed in the Formosan language in Holland, the recapture of the island not being yet known there; in 1682, it was finally given up to the Chinese government. 47. The *Moluccan* is considered by Dr Leyden as an original language; that of Magindanao contains some Malayan, Moluccan, Tagalish, and Bugis. The *Tagalish,* or *Gala,* is the principal language of the *Philippines,* and almost as generally understood in that neighbourhood as the Malay and Hindustanee in other parts; it is allied to the Malayan and to the Javanese, and was probably derived in great measure from these languages; it also resembles in some measure the Bugis. The *Bissayish* is a ruder dialect of the Tagalish. The *Sulu* differs but little from these dialects, being derived from the same sources. The *Bugis* is the language of Celebes; it is supposed to be more ancient than the Javanese; it seems to contain no Sanscrit, but much Malay, Tagalish, and Javanese, and some of the old Ternate, or Moluccan; it is written in a peculiar character, and some good poetry is found in it. There is a dialect called the *Mungharar.* The *Bima* somewhat resembles this dialect; it is spoken in the eastern parts of Sumbawa, and the western of Endé or Flores; it is written either in the Bugis or the Malay character; it seems to have a distant resemblance to the language of Orissa. The dialect of *Sumbawa* exhibits some slight variations. A few single words, as *Matta,* the eye, and *Matte,* death, are found to coincide in almost all the islands of the *Pacific Ocean;* the languages of which, notwithstanding their immense distances, seem to differ less than those of the inhabitants of some very small continental tracts; and they might probably be divided into a few well-defined families, if our knowledge of them were more complete. The resemblance of *Matte* to the Arabian *Mot,* and the Latin *Mactare,* is probably accidental.

The number of the AFRICAN languages is supposed to amount to one hundred or one hundred and fifty, and as many as seventy or eighty of them have been distinguished with tolerable accuracy. The population of Africa seems to have been derived from Arabia, and, as some critics think, rather from the southern than from the northern parts; a great number of its present inhabitants are negroes, but these cannot be distinguished from the rest by any infallible criterion. The account given by Ptolemy of the interior part of the country appears to be wonderfully accurate and extensive; although some of his measures seem to be erroneous, and not sufficiently reconcileable with the truth, even by adopting Major Rennell's hypothesis respecting them. It is however remarkable that Ptolemy followed Hipparchus in extending the eastern coast of Africa to the Ganges, although more correct ideas of its form had been entertained at Alexandria before his time.

The *Egyptians* demand the priority in treating of the inhabitants of Africa, from their early connection with ancient history, both sacred and profane. It is observable that the representations of the old Egyptians have countenances more or less approaching to the negro physiognomy, though the dry bones of the skeleton have that character somewhat less decidedly than they must have had when clothed with the thick lips and flattish noses of the generality of the representations; at the same time there are sculptures of great antiquity, which exhibit features not unlike those of correct Grecian or Roman beauty; and others have a considerable resemblance to the Arabian nation. At present the people of middle Africa in general are more or less like negroes, but they are somewhat less dark, and their noses and lips are less peculiar; the women sometimes screamed if Burckhardt made his appearance on a sudden, and called him the Devil, because he was white. The Egyptians are supposed by some writers to have received their civilization from Ethiopia; but there are at present no traces of the remains of high civilization farther south than Nubia, except a few scattered monuments about Axum, of no great antiquity. The Egyptians were at first called Copts by the Saracens, and their language has been commonly distinguished by the appellation *Coptic*, that is, as written in characters which are principally Greek, and frequently intermixed with a number of pure Greek words; but not a single fragment of Coptic has yet been discovered in this form that is earlier than the establishment of Christianity in Egypt; and it seems probable that the character was introduced by the early Christians at the time of the translation of the Scriptures into Coptic, which is certainly of very high antiquity. The Greek authors frequently mention an Egyptian alphabet of twenty-five letters; but no traces of any such alphabet are found in the multitudinous inscriptions or manuscripts that have been preserved by the exertions of the numerous and adventurous travellers who have lately visited the country. The Greek words mixed with the Coptic are not considered by the grammarians as incorporated with the language, nor are they admitted into the dictionaries. The genuine language bears very evident marks of great antiquity; its construction is simple and often awkward; and a great number of its words are monosyllables. We have positive evidence of its having remained unaltered from the time of Herodotus, Plutarch, and other Greek authors; and it affords us the etymology of the name of Moses, and of some other words mentioned in the Scriptures. It exhibits a few coincidences with other ancient languages, but not enough to enable us to consider it either as the offspring or the parent of any of them, except that it gives us something like an explanation of the meaning of some of the Greek particles. Out of one hundred and fourteen original Egyptian words, there are fifty-two that resemble the Greek, twenty-seven the German and English, eighteen the Hebrew, three the Syriac, two the Arabic, two the Sanscrit, one the Sclavonian, and one the Cantabrian. It is, however, probable, that a person more intimately acquainted with the languages of the Arabian family would have been able to find a much greater number of coincidences, since nations which had so much intercourse as the Jews and the Egyptians could scarcely fail to have many words in common, even if their languages had been at first completely different; and probably many of the Arabic roots, which are not Hebrew, may be found in the Egyptian. To the Cantabrian word inserted in this enumeration, Dr Young added five others, the whole six being *Berria*, new; *Ora*, a dog; *Guchi*, little; *Oguia*, bread: " Otsoa," a wolf, whence the Spanish *Onza;* and *Shashpi*, seven: in Coptic, *Beri*, new; *Uhor*, a dog; *Kudshi*, little; *Oik*, bread; *Uonsh*, a wolf; and *Shashf*, seven. Hence he infers, that " if we consider these words as sufficiently identical to admit of our calculating upon them, the chances will be more than a thousand to one that, at some very remote period, an Egyptian colony established itself in Spain; for none of the languages of the neighbouring nations retain any traces of having been the medium through which these words have been conveyed. On the other hand," he continues, " if we adopted the opinions of a late learned antiquary," General Vallancey, " the probability would be still incomparably greater that Ireland was originally peopled from the same mother country; since he has collected more than one hundred words which are certainly Egyptian, and which he considers as bearing the same sense in Irish; but the relation, which he has magnified into identity, appears in general to be that of a very faint resemblance; and this is precisely an instance of a case in which it would be deceiving ourselves to attempt to reduce the matter to a calculation." It may, indeed, be imagined that the Egyptian dominions may formerly have extended to the Straits of Gibraltar, and that Spain may have derived a part of its population from this part of Africa, which approaches so near to it; but it could scarcely have happened that no traces of Egyptian monuments should ever have been found at any distance from the Nile, if that active people had really occupied any considerable portion of the neighbouring continent. The word *Chemistry*, in Greek *Chemia*, is well known to be derived from the Egyptian; it has successively been compared, by the Quarterly Reviewer, to *Chim* or *Chem*, heat, and to *Chem*, secret, the latter being the more probable origin of the two; and a third etymon might be found, if it were required, in the *Dshem*, or *Ghem*, to find, or Invention. The Coptic language has been nearly extinct for about two centuries; but the service has been read in Coptic much more lately in some of the churches, though it has now been almost entirely superseded by the Arabic. The proper Coptic, or Memphitic, which was the dialect of Lower Egypt, is supposed, from a word quoted by Herodotus, to be the most ancient; the Sahidic or Thebaic of Upper Egypt was probably preserved for a longer time, especially in some of the monasteries; there is a separate version of the principal part of the *Bible* in this dialect, fragments of which have been published by Mingarelli and Woide; a third dialect, much resembling the Thebaic, is commonly called the Bashmuric; and a fourth, the Oasitic, has been partially made known by Mr Quatremère de Quincy. The Egyptians have left no traces of their language among the people who at present occupy the countries that they inhabited; the Nubian vocabularies collected by Burckhardt contain no Coptic words; the people are of different Arab races, but have acquired peculiar dialects, probably mixed with those of the neighbouring negro nations, of several of which we find specimens in Mr Salt's *Voyage to Abyssinia.* But one of the most learned, as well as the most adventurous and industrious, of modern travellers, has remarked some coincidences between the old Egyptian language and that of the Barabras, who are neighbours of the Nubians, and extend to the confluence of the Tacazze and the Nile. The Geez and Amharic have already been mentioned as descendants of the Arabian family; they seem to have introduced some traces of this extraction into several of the neighbouring dialects, probably by the translations of the Scriptures, or by the use of the Koran. Professor Vater has taken some pains to prove that the language of Amhara, the Camara of Agatharchides, is wholly independent of the Ethiopic and Arabian; but in this he appears to be mistaken. It exhibits some slight resemblance to the Sanscrit, in a few instances; thus, *Tshegure* is hair, in Sanscrit, *Tshicura.* Macrizi tells us, that there are, in the whole, fifty Abyssinian dialects; but he has probably exaggerated their number. We have obtained more authentic information respecting them from the collections of Bruce, and of his editor, Murray, and still more lately from Dr Seetzen and Mr Salt. Of the Mek of Dongola, the representative of a long race of the Christian kings of Nubia, little is now known, except that he is in a great measure dependent on the king of Sennaar on the one hand, and has been expelled from a part of his territories by the Mamelukes on the other. Of the Agows and the Gafats, neighbours of the Abyssinians, and situated on the Bahr el Azrek, as well as the Jewish Falashas, who are scattered over the country, especially in Dembea, we have read much in the historical romances of Mr Bruce, which certainly give a faithful picture of the countries to which they relate, notwithstanding some unaccountable inaccuracies with respect to the personal adventures of the author.

The north of Africa is occupied by inhabitants not much differing in appearance from the Arabs. Its three principal divisions are the coast, the country of wild beasts, and the desert. The later Arabs have expelled the earlier Africans from the first division, and partly from the second; the Berbers occupy the third, inhabiting principally the Oases, or cultivable islands, scattered through the desert from Mount Atlas to Egypt, and speaking, as Horneman first ascertained, the same language throughout this vast extent. They were first well described by Leo Africanus: they are probably the remains of the Mauritanians, Numidians, Gætulians, and Garamatians. There is no foundation whatever for the opinion of some modern authors of celebrity, that their language is derived from the Punic. We even find, from Sallust, that the Numidian language differed from the Carthaginian, and from Valerius Maximus; that it was written in a peculiar character, perhaps the same with that which is found in the inscriptions from Lebeda, now in the court of the British Museum. The language of the *Canaries* considerably resembles the Berber; thus, milk is *Acho* in Berber, and *Aho* in the Canaries. These islands were discovered in 1330, and afterwards conquered, with some difficulty, by the Spaniards. The inhabitants were a fine race of men, and lived in comfort and tranquillity; and they still present some traces of their original character and condition.

The country between the desert Zahara and the Niger is inhabited by a race of people who have a great resemblance to negroes, but are somewhat different from them. In the east are those of *Soudan* or *Afnu*, and *Begermah;* in the west the *Foulahs;* the *Fellatas* are a branch of these, extending considerably to the north-east, with a mixture of negroes.

Of the languages of the negroes, strictly so called, many interesting specimens have been collected by the zeal of the evangelical missionaries in the Caribbee Islands, and published by Oldendorp, in his Account of the Mission; but they do not afford us sufficient materials to enable us to trace any extensive connections or dependencies among their multifarious dialects.

There are some points of coincidence between the language of *Madagascar* and those of the Malays, the Philippine islanders, the *Beetjuana* Caffres, and the *Corana* Hottentots: there are also a few words, in many of the African dialects, borrowed from the modern Arabic, not, as Court de Gebelin would persuade us, from the Phœnician. Nor can any other of the affinities be very distinctly established.

The *Caffres* have little of the negro character except the black colour, and less of this as they become more remote from the equator. They are supposed to extend across the whole of Africa, immediately north of the Hottentots, as far as Benguela and Quiloa. The *Hottentots*, with their neighbours the *Bosjemen*, speak different dialects of the same singular language, in different parts of their country. Of that of the *Dammaras*, little or nothing is known. Lichtenstein has classed them as Hottentots; but Barrow, who was better acquainted with them, considers them as Caffres.

(Gesner, *Mithridates de Differentiis Linguarum*, Zurich, 1555, 8vo; Megiser, *Specimen XL. Linguarum*, 1592; Duret, *Thrésor de l'Histoire des Langues*, 4to; Lüdeken (Müller), *Specimina Linguarum*, Berl. 1680; Chamberlayne, *Oratio Dominica*, Amst. 1715; Schultz, *Orientalischer und Occidentalischer Sprachmeister*, Leipz. 1748; Hervas, *Saggio*, Hervas, *Idea dell' Universo*, Cesenn. 1778–87, vol. xvii.–xxi. 4to; *Vocabularia Comparativa*, 2 vols. 4to, Petersburg, 1787, 4 vols. 1790; Bergmann, *Specimina*, Ruien, 1789; Marsden's *Catalogue of Dictionaries and Grammars*, 1796; Marcel, *Oratio Dominica*, Paris, 1805; Adelung und Vater, *Mithridates, oder allgemeine Sprachkunde*, 4 vols. 8vo, Berlin, 1806–17; Le Pileur, *Tableaux Synoptiques de Mots similaires*, 8vo, Paris and Amst. 1812; Jamieson's *Hermes Scythicus*, 8vo, Edin. 1814; Townsend's *Character of Moses*, vol. ii. 4to, Bath, 1815; Leyden, *Asiatic Researches*, x.; *Brief View of the Baptist Missions and Transactions*, 8vo. LANGUED, in *Heraldry*, expresses such animals whose tongue, appearing out of the mouth, is borne of a different colour from the rest of the body.

LANGUEDOC was, previously to the revolution, the name of a large province of France, two hundred and twenty miles in length, by one hundred and twenty in breadth. It was divided into Upper and Lower Languedoc, Toulouse being the capital of the former, and Montpellier, so celebrated for the salubrity of its climate, the capital of the latter. Languedoc is now divided into the departments of Gard, Hérault, Ardèche, Lozère, Tarn, Upper Garonne, Aude, and Upper Laine. These will be found described in their regular alphabetical order.

LANGUET, HUBERT, one of the boldest political writers of the sixteenth century, was born in 1518, at Viteaux, a town in Burgundy, of which his father was governor. He early evinced an inclination for study, and at the age of nine not only understood, but spoke, Latin. Having completed his studies, he resolved to travel. He set out for Germany, where the learned Joachim Camerarius had little difficulty in embuing him with the principles of the reformers; but the tumultuous scenes of which he was a daily witness determined him to pass into Italy, there to await the return of tranquillity. He remained some time at Padua, where he studied civil law, and took his degree of doctor in 1548. He then rapidly visited the principal cities of Italy, and hastened his return to Germany, being urged by a desire to make the acquaintance of Melancthon, whose works had afforded him very great pleasure. He arrived at Wittemberg in the course of the year 1549; and, as long as Melancthon lived, he returned annually to pass the winter at Wittemberg. From 1551 to 1560 he visited Sweden, Denmark, Lapland, and made two journeys into Italy; the first to satisfy his curiosity on different points, and the second in the suite of Adolphus Count of Nassau, who had desired to have the pleasure of his society. In 1565 he entered the service of Augustus, elector of Saxony, who afterwards sent him to France to congratulate Charles IX. on the re-establishment of peace in his dominions. Languet then accompanied the elector to the siege of Gotha, of which he has left a good account; and was deputed, in 1568, to attend the diet of Spires. In 1570 he assisted at the conferences of Stettin, and was sent into France the same year to compliment Charles IX. on his marriage, and at the same time to engage him to cause the treaties which guaranteed to the Protestants the free exercise of their religion, to be observed. He was at Paris on the day of the massacre of St Bartholomew, and made so many efforts to save the printer Wechel, and Duplessis-Mornay, both his intimate friends, that he drew on himself the attention of the assassins, and would have fallen a victim to his humane exertions, had it not been for the affection of Morvilliers, bishop of Orleans, who kept him concealed. Being soon afterwards recalled to Saxony, he was sent to Vienna in 1574. In 1577 he passed into the service of the count palatine John Cassimir, and then attached himself to the Prince of Orange, who employed him usefully in different negotiations. Languet died at Antwerp on the 30th of September 1581. His works are, 1. Historica Descriptio susceptæ a Cæsarea majestate executionis Augusto Saxoniæ septem viro duce contra S. Romani imperii rebelles, eorumque receptatorem et captæ urbis Gothæ, 1568, in 4to; 2. Harangue fait au Roi Charles IX. de la part des Princes Protestants d'Allemagne, inserted in the *Mémoires du Règne de Charles IX.* (vol. i.); 3. Epistolæ Politicæ et Historicæ ad Philipp. Sydnæum, Francfort, 1630, in 12mo; 4. Epistolæ ad Joachimum Camerarium, et filium, Groningen, 1646, in 12mo; 5. Arcana sæculi decimi-sexti, seu Epistolæ secretæ ad Principem suum Augustum Saxoniæ Ducem, Halle, 1699, in 4to; 6. Apologie ou Défence de Guillaume, prince d'Orange, contre le ban et l'édit du roi d'Espagne, Antwerp or Delft, 1581, in 4to; 7. Vindiciæ contra Tyrannos, sive de Principis in Populum, Populique in Principem legitima potestate, Basil, 1579, in 8vo. This last work, which went through a great number of editions in Germany and Holland, was published by the author under the name of Junius Brutus; and was afterwards translated into French by François Estienne, under the title, *De la Puissance légitime du Prince sur le Peuple.* By a singular anomaly, the translation is now much more rare than the original. (A.)

LANGUET, *John-Baptist-Joseph*, a doctor of the Sorbonne, was born at Dijon in 1675. He was received into the Sorbonne in 1698, and attached himself to the community of St Sulpice, to which parish he rendered important service. M. de la Chétardie, the vicar, conscious of his talents, chose him as his curate, in which capacity he officiated for nearly ten years, and in 1714 succeeded to the vicarage. His parish church being small and out of repair, he conceived the design of building a church suitable to the size of the parish, which he began with the sum of a hundred crowns, but soon obtained considerable donations; and the Duke of Orleans, regent of the kingdom, granted him a lottery, and laid the first stone of the porch in 1718. It was consecrated in 1745, M. Languet having spared neither labour nor expense to render it one of the finest churches in the world, both for architecture and ornament. Another work which did him no less honour was the *Maison de l'enfant Jesus.* This establishment consisted of two parts; the first composed of about thirty-five poor ladies of good families, and the second of more than 400 poor women and children of town and country. The order and economy in this house, for the education and employment of so many persons, gave Cardinal Fleury so high an idea of the vicar of St Sulpice, that he proposed to make him superintendent-general of all the hospitals in the kingdom; an appointment, however, which he declined. M. Languet was not only singular in this warm, disinterested, and benevolent conduct, but also in other circumstances equally rare, namely, the refusal of several bishoprics which were offered him. He even resigned his vicarage in 1748, but continued to preach every Sunday at his own parish church, and to support the *Maison de l'enfant Jesus*, to his death, which happened in 1750.

LANGUOR, amongst physicians, signifies great weakness and loss of strength, attended with a dejection of mind, so that the patients can scarcely walk or even stand upright, but are apt to faint away.

LANHAM. See LAVENHAM.

LANIARD, or LANYARD (from *Lanier*, Fr.), a short piece of cord or line fastened to several machines in a ship, and serving to secure them in a particular place, or to manage them more conveniently. Such are the lanyards of the gun-port, the lanyard of the buoy, the lanyard of the cat-hook, and others. The principal lanyards used in a ship, however, are those employed to extend the shrouds and stays of the masts by their communication with the dead eyes, so as to form a sort of mechanical power resembling that of a tackle. These lanyards are fixed in the dead eyes as follows: One end of the lanyards is thrust through one of the holes of the upper dead eye, and then knotted to prevent it from drawing out; the other is then passed through one of the holes in the lower dead eye, whence, returning upwards, it is inserted through the second hole in the upper dead eye, and next through the second in the lower dead eye, and finally through the third holes in both dead eyes. The end of the lanyard being then directed upwards from the lowest dead eye, is stretched as stiff as possible by the application of tackles; and, that the several parts of it may slide with more facility through the holes of the dead eyes, it is well smeared with hog's lard or tallow, so that the strain is immediately communicated to all the turns at once.

LANIGEROUS, an appellation given to whatever bears wool.

LANISTA, in *Antiquity*, is sometimes used to signify an executioner, but more frequently a master gladiator, who taught the use of arms, and had always people under him ready to exhibit shows of that kind. For this purpose they either purchased gladiators, or educated in that art children who had been exposed.

LANJANG, or LANTCHANG, a city of Laos, situated on the river Mecon, of which we have no very exact accounts. It is said to be extensive and splendid. The palace of the sovereign is equal in extent to a city, while those of the grandees are large and elegant. The dwellings of the lower orders are, as usual in the East, mere huts. Long. 104. 38. E. Lat. 18. 30. N.

LANNION, an arrondissement of France, in the department of the Northern Coasts, extending over 403 square miles, and containing a population of 90,500 persons. It is divided into seven cantons and fifty-nine communes. The capital is a city of the same name, situated on the river Guer, about two miles from the sea, and contains 3200 inhabitants. In the neighbourhood are some mines, which yield some iron and a little silver.

LANSQUINET, the name of a game at cards, which is of French origin. It may be played at by any number of people, though a single pack of cards is used during the deal. The dealer, who possesses an advantage, shuffles the cards, and, after they have been cut by another of the party, deals out two cards on his left hand, turning them up, then one for himself, and a fourth which he places on the table for the company, and which is called the *rejouissance.* On this card any or all of the company, the dealer excepted, may put their money, which the dealer is compelled to answer. The dealer continues turning the cards upwards, one by one, till two of a sort come up, that is to say, two aces, two deuces, or the like, which, to prevent mistakes, or their being considered as single cards, he places on each side of his own card; and as often as two, three, or the fourth sort of a card comes up, he invariably places, as before mentioned, on each side of his own card. The company has a right to take and put money upon any single card, unless the dealer's card should happen to be double, which is often the case, by his card being the same as one of the two hand-cards which he first dealt out on his left hand. Thus he continues dealing till he brings either their cards or his own. Whilst the dealer's own card remains undrawn, he wins; and whichever card is turned up first, loses. If he deals out the two cards on his left hand, which are styled the *hand-cards*, before his own, he is entitled to deal again. This advantage amounts to no more than his being exempted from losing, when he turns up a similar card to his own, immediately after he has turned up one for himself. Lansquinet is often played without the *rejouissance*, the dealer giving every one of the party a card to put his money upon. It is often played also by dealing only two cards, one for the company and the other for the dealer. It should be observed, that a limitation is generally fixed for the sum to be placed upon any card or number of cards, either in gold or silver, beyond which the dealer is not obliged to answer.

LANTERN, or Lanthorn, a device to carry a candle in, being a kind of cover usually made of tinned iron, with sashes of some transparent matter, as glass, horn, or the like, to transmit the light.

Dark Lantern, one with only one opening, which may also be closed up when the light is to be entirely hid, or opened when there is occasion for the assistance of the light to discover some object.

Magic Lantern, an optical machine, by which little painted images are represented so much magnified, as to be accounted the effect of magic by the ignorant.

Lantern, in *Architecture*, a little dome raised over the roof of a building, to give light, and serve as a crowning to the fabric.

The term *lantern* is also used to signify a square cage of carpentry placed over the ridge of a corridor or gallery, between two rows of shops, to illuminate them.

Lantern, on board of ship, a well-known machine, of which there are many in a ship, particularly for the purpose of directing the course of other ships in a fleet or convoy; as the poop and top lanterns, &c.

Feast of Lanterns, in China, is a celebrated feast held on the fifteenth day of the first month, and so called from the infinite number of lanterns which are hung out of the houses and streets. On this day are exposed lanterns of all prices, some of them very costly.

LAOCOON, in fabulous history, a son of Priam and Hecuba, or, according to others, of Antenor or of Capys. Being priest of Apollo, he was commissioned by the Trojans to offer a bullock to Neptune, in order to render him propitious. During the sacrifice two enormous serpents issued from the sea, and attacked Laocoon's two sons who stood next to the altar. The father immediately attempted to defend his sons; but the serpents falling upon him, squeezed him in their complicated coils, and he died in the greatest agony. This punishment was said to have been inflicted upon him for dissuading the Trojans from bringing into the city the fatal wooden horse which the Greeks had consecrated to Minerva, as also for his impiety in hurling a javelin against the sides of the horse as it entered within the walls. According to Hyginus, he suffered this punishment for his marriage against the consent of Apollo, or, according to others, for his polluting the temple, by his commerce with his wife Antiope before the statue of the god.

Laocoon, in the history of the arts, is a celebrated monument of Greek sculpture, executed in marble by Agesander, Polydorus, and Athenodorus, the three famous artists of Rhodes. Agesander is supposed to have been the father of the two latter. This remain of antiquity was found at Rome in the ruins of the palace of Titus, in the beginning of the sixteenth century, under the pontificate of Julius II. and afterwards deposited in the Farnese Palace. Laocoon, the priest of Apollo and Neptune, is here represented, along with his two sons, with two hideous serpents clinging round his body, gnawing it, and injecting their poison. This statue exhibits the most astonishing dignity and tranquillity of mind in the midst of the most excruciating torments. Pliny[1] says of it, that it is *Opus omnibus pictoreæ ex statuariæ artis, præferendum.*

LAODICÆA on the Lycus, in *Ancient Geography*, a town of Phrygia, at first called *Diospolis*, then *Rhoas*. It was built by Antiochus, son of Stratonice, and called after his consort *Laodice*.

Laodicæa on the Sea, in *Ancient Geography*, according to Strabo, was a town of Seleucis in Syria, extremely well built, with a commodious harbour. The country about it yielded great quantities of wine. The city took its name from Laodice, mother of Seleucus, the founder of it.

LAOMEDON, a king of Troy, whose history is involved in fables. He was son of Ilus king of Troy, and married Strymo, called by some Placia, or Leucippe, by whom he had Podarces, afterwards known by the name of Priam, and Hesione. He built the walls of Troy, and was assisted by Apollo and Neptune, whom Jupiter had banished from heaven, and condemned to be subservient to the will of Laomedon for one year. When the walls were finished, Laomedon refused to reward the labours of the gods, and soon afterwards his territories were laid waste by the sea or Neptune, whilst his subjects were visited by a pestilence sent by Apollo. Sacrifices were offered to the offended divinities; but the calamities of the Trojans increased, and nothing could appease the gods, according to the words of the oracle, but annually to expose to a sea monster a Trojan virgin. Whenever the monster appeared, the marriageable maidens were assembled, and the lot decided which of them was doomed to death for the good of her country. When this calamity had continued for five or six years, the lot fell upon Hesione, Laomedon's daughter. The king was unwilling to part with his daughter, whom he loved with uncommon tenderness, yet conscious that his refusal would greatly irritate the wrath of the gods. In the midst of his fear and hesitation, Hercules came and offered to deliver the Trojans from this public calamity, if Laomedon would promise to reward him with a number of fine horses. The king consented; but when the monster was destroyed, he refused to fulfil his engagements, and Hercules was obliged to besiege Troy and take it by force of arms. Laomedon was put to death, after a reign of twenty-nine years; his daughter Hesione was given in marriage to Telamon, one of the conqueror's attendants; and Podarces was ransomed to the Trojans, and placed upon his father's throne. According to Hyginus, the wrath of Neptune and Apollo was kindled against Laomedon because he had refused to offer as a sacrifice on their altars all the first-born of his cattle, according to a vow which he had made.

LAON, an arrondissement in the department of the Aisne, in France. It is 960 square miles in extent, is divided into eleven cantons, and these into 291 communes; and contains 141,650 inhabitants. The capital is the city of the same name, situated on a hill in an extensive plain. The ancient cathedral is the only remarkable edifice. It contains 1600 houses, and 7000 inhabitants, who are employed in preparing hosiery and leather, and in trading in corn and wine. In this plain the army of Marmont was defeated by Blucher on the 9th of March 1814, and that commanded by Bonaparte on the two following days, which led to the capture of Paris. Long. 3. 32. 7. E. Lat. 49. 33. 54. N.

LAOS, a kingdom of India beyond the Ganges, extending from the twelfth to the eighteenth degrees of north latitude, and having Tonquin and Cochin-China on the east, Cambodia on the south, Siam on the west, and an

---

[1] Lib. xxxvi. c. 5.

Lapa Isle.
Laperouse.

unexplored region on the north. Of this extensive country all the knowledge which we possess is derived chiefly from Portuguese writers, and from the report of traders; and the accounts are frequently contradictory. All accounts agree, however, that the country is in general poorly cultivated, and thinly inhabited; the smaller villages consisting of collections of huts, and a great part of the population being merely erratic hordes, who live in a migratory state. These tribes are of very warlike habits, and wage almost constant war with each other. They are accustomed to the use of fire-arms. In their persons they resemble the southern Chinese, being of an olive complexion, and in their dispositions are frank and honest. This country carries on commerce with Tonquin and Cochin-China, to which it sends elephants, precious stones, gold, musk, ivory, wax, bamboos, and cotton; and in exchange receives salt, salt-fish, oil, silken stuffs, fire-arms, and gunpowder. This trade is chiefly carried on by the Chinese and Tonquinese merchants, and a caravan occasionally comes from Siam. The people of this country are only nominally subject to the Cochin-Chinese, their independence being secured partly by the insalubrity, and partly by the inaccessible nature, of their country. There is a tradition of a higher state of knowledge among the people in former times; and a considerable number of books is said to have been written in the Bali language. But there are no longer any traces of this high civilization. The people are ignorant and superstitious. The belief in magic is general; and the physician exercises the double profession of doctor and conjuror, and by the latter trade makes considerable gains.

LAPA ISLE, one of the Sooloo Isles, situated due south from the island of Sooloo. The land is high and woody, and forms good shelter from the south-west and north-west winds.

LAPATHUS, LAPETHUS, or LEPITHUS, in *Ancient Geography*, a town of Cyprus, with a port or station for ships, and a cognominal river. It was built by a colony of Phœnicians, according to Scylax; by Belus king of Tyre, according to Alexander Ephesus. According to Strabo, it was built by a colony of Spartans; and one of the nine kings resided here, the last of whom was Pisistratus, who commanded the naval force of Alexander the Great. There was a temple here dedicated to Venus.

LAPEROUSE, JOHN FRANCIS GALUPE DE, a French navigator, distinguished for talent, enterprise, and philanthropy, and memorable on account of his mysterious fate, was born at Albi, in Languedoc, in the year 1741. He received his education at the Marine School, and at an early age entered the naval service of his country. He rapidly rose to distinction, and, in 1782, when France and England were at war, he was intrusted with the command of an expedition destined for the destruction of the English settlement at Hudson's Bay. He was completely successful in his enterprise, having destroyed Fort York, and taken the English commander prisoner. Some acts of humanity which he performed on this occasion cannot be overlooked, especially in the life of an individual whose own unhappy fate must always excite our pity and regret. When on the eve of his return home, he was informed that a number of the English, to escape falling into his hands, had abandoned their habitations, and sought an asylum in the woods, where, without food or shelter, they must inevitably fall victims to the rigours of the climate. His orders were utterly to destroy the settlement; but the man prevailed over the commander, and the fugitives were abundantly supplied with provisions, arms, and ammunition. The papers of the governor of Fort York, which had fallen into his hands, were also generously returned to their owner. After the restoration of peace, France resolved on prosecuting maritime discovery; and having fitted out two vessels, the *Boussole* and the *Astrolabe*, appointed Lapérouse to the command of the expedition. It set sail from Brest on the 1st of August 1785, and after touching at the coast of Brazil, proceeded to Conception Bay in Chili, where the ships were refitted, and provisions taken on board. Lapérouse next visited Owhyhee, one of the Sandwich Islands, and then set sail for the north-west coast of America, which he reached towards the end of June 1786, and spent some time in exploring. A port was discovered, which was named Port des Françaises, and here the vessels cast anchor, after narrowly escaping shipwreck. Nothing of moment occurred during their stay at this place, except the loss of two boats, and twenty-two men, to whose memory Lapérouse, with his characteristic humanity, erected a monument, bearing an appropriate inscription. Having refitted his ships at a settlement in California, our navigator steered for China; and, in crossing the North Pacific Ocean, discovered Necker Island. Various parts of Asia were successively visited, and the straits which bear the name of Lapérouse were discovered. Towards the end of 1787, Lapérouse landed on Maouna, one of the Navigator Islands, where the commander of one of the vessels, and twelve other individuals, were massacred by the natives. The long boats were likewise destroyed by the savages, so that it was found necessary to go to Botany Bay, where the expedition arrived on the 26th of January 1788. After building new boats, and taking in supplies, Lapérouse set sail from this place in March, having previously written a letter to France, stating his intention to continue his researches till December, when, after visiting the Friendly Islands, he expected to arrive at the Isle of France. This was the last intelligence received of the fate of the expedition, and for a period of nearly forty years not the slightest trace of the course which it had taken could be found, although, in 1791, two frigates were despatched from Brest in search of it. Some years ago, however, public attention was attracted to this mysterious affair, by the publication of a work by Captain Dillon, an English commander, in which a detailed account was given of there having been found on an island of the Pacific Ocean, one of those belonging to the group called the New Hebrides, various articles which had belonged to the two vessels of Lapérouse. The facts discovered by Captain Dillon were, that the two ships struck on a reef at Maunicolo, in lat. 11. 4. S. long. 169. 20. E.; that one of them immediately went down, and most on board perished, but that the greater part of the crew of the other escaped. With the remnants of the vessels the survivors constructed a craft, in which all but two individuals put to sea; but the ill-fated bark was never more heard of. The articles brought home were various parts of a ship, as well as a few domestic utensils, on some of which were stamped the national arms of France, and on others those of private families. Viscount Lesseps, a nobleman who had left the expedition at an early period, carefully examined these relicts, and gave it as his opinion, that in all probability they belonged to the Astrolabe and Boussole. Still, however, a veil hangs over the fate of Lapérouse; and that the vessels wrecked on the island of Maunicolo were really those under his command, wants further confirmation. By the nobleman above named, Lapérouse sent home journals and papers relating to the expedition, which were published at Paris in 1797, in four vols. 4to; and they have been translated into English, and frequently printed, principally in an abridged form.

Lapidary.

LAPIDARY, an artificer who cuts precious stones. The art of cutting precious stones is of great antiquity. The French have carried it to high perfection, but they are not in any degree superior to the British. There are various machines employed in the cutting of precious stones, according to their quality. The diamond, which is extremely hard, is cut on a wheel of soft steel, turned by a mill, with diamond dust tempered with olive oil, which also serves to polish it. The oriental ruby, sapphire, and topaz, are cut on a copper wheel, with diamond dust tempered with olive oil, and are polished on another copper wheel with tripoli and water. The hyacinth, emerald, amethyst, garnets, agates, and other stones not of an equal degree of hardness with the other, are cut on a leaden wheel with smalt and water, and polished on a tin wheel with tripoli. The turquoise of the old and new rock, girasol, and opal, are cut and polished on a wooden wheel with tripoli also.

Lapidary is also used for a virtuoso skilled in the nature, kinds, and values of precious stones; or a merchant who deals in them.

Lapidary Style denotes the style proper for monumental or other inscriptions. This is a kind of medium between prose and verse; the jejune and the brilliant are here equally to be avoided. Cicero has prescribed the rules of it: *Accedat oportet oratio varia, vehemens, plena spiritus. Omnium sententiarum gravitate, omnium verborum ponderibus, est utendum.*

LAPIDESCENT, any thing which has the faculty of petrifying, or turning bodies to a stony nature. The older naturalists speak of a lapidescent principle, a lapidescent spirit, a lapidescent juice, and so on.

LAPIS, in general, is used to denote a stone of any kind or description.

Lapis, in Roman antiquity, a geographical measure denoting a mile, because miles were distinguished by erecting a stone at the end of each; from the number marked on which, the length of way to or from Rome might be known. This device is ascribed by Plutarch to Caius Gracchus; but it was more accurately executed by Augustus, who erected a gilt pillar in the forum, at which all the public ways of Italy, distinguished by stones, were terminated. The same thing was done in the Roman provinces. Hence the phrases *tertius lapis, centesimus lapis,* for three or a hundred miles; and sometimes the ordinal number, without *lapis,* as *ad duodecimum,* at twelve miles distance.

LAPITHÆ, in *Ancient Geography,* a people of Thessaly. See the next article.

LAPITHUS, in fabulous history, a son of Apollo by Stilbe. He was brother to Centaurus, and married Orsinome, daughter of Euronymus, by whom he had Phorbas and Periphas. The name of Lapithæ was given to the numerous children of Phorbas and Periphas, or rather to the inhabitants of the country of which they had obtained the sovereignty. The chief of the Lapithæ assembled to celebrate the nuptials of Perithous, one of their number. Amongst them were Theseus, Dryas, Hopleus, Mopsus, Phalerus, Exadius, Prolochus, Titaresius, and others. The Centaurs were also invited to partake of the common festivity; and the amusements would have been harmless and innocent, had not one of the intoxicated Centaurs offered violence to Hippodamia, the wife of Perithous. The Lapithæ resented the injury, and the Centaurs supported their companions; upon which the quarrel became universal, and ended in blows and slaughter. Many of the Centaurs were slain, and they were at last obliged to retire. Theseus amongst the Lapithæ showed himself brave and intrepid in supporting the cause of his friends; and Nestor also was not less active in the protection of chastity and innocence. Hesiod has described the battle of the Centaurs and Lapithæ; as has also Ovid, in a more copious manner. The invention of bits and bridles for horses is attributed to the Lapithæ.

LAPLACE, Pierre Simon, Marquis de, one of the greatest geometricians and physical astronomers that any age or country has produced, and scarcely less distinguished in the other natural sciences, was a native of Normandy, in which province he first saw the light on the 23d of March 1749. It was observed, even at the commencement of his studies, that he was endowed with a prodigious memory; and that all the ordinary occupations of the mind were to him easy. He rapidly acquired an extensive knowledge of the ancient languages, and cultivated different branches of literature. Every thing interested his rising genius, and every thing served to unfold it. His first successes were achieved in theological studies; the most difficult points of controversy he treated with extraordinary talent and sagacity.

It is not known by what fortunate accident M. de Laplace passed from the study of scholastic learning to that of the higher geometry. This last science, which scarcely admits of a divided affection, now attracted and fixed his attention. From that time, he abandoned himself without reserve to the impulse of his genius, and became sensible that a residence in the capital had become necessary to him. D'Alembert then enjoyed all the splendour of his European reputation. It was he who had just informed the court of Turin, that its academy possessed a geometrician of the first order, Lagrange, who, but for this noble testimony to his merits, would have remained long unknown. D'Alembert had announced to the king of Prussia, that there was only one man in Europe fitted to replace at Berlin the illustrious Euler, who, having been recalled by the government of Russia, had consented to return to St Petersburg. Amongst his inedited letters, Baron Fourier discovered the details of the negociation which fixed Lagrange as a resident at Berlin.

About the same time, M. de Laplace commenced that long career which was destined soon to become so illustrious. He presented himself at the house of D'Alembert, preceded by numerous recommendations, which might have been supposed to be all-powerful. But his attempts were vain; he was not even introduced. He then addressed to the man whose suffrage he had in vain solicited, a very remarkable letter on the general principles of mechanics, of which, at an after period of his life, he several times cited various fragments to his friend Baron Fourier. It was impossible that so great a geometrician as D'Alembert should not be struck with the singular profundity of this composition. The same day, he waited upon the author of the letter, and said to him, "Sir, you see that I pay little attention to recommendations; you have no need of them. You have made yourself better known; that is sufficient for me; you may command my support." A few days afterwards, he got M. de Laplace appointed professor of mathematics to the Military School of Paris. From this moment, having devoted himself exclusively to the science which he had selected, the latter gave to all his labours a fixed direction, from which he never afterwards deviated; for the imperturbable constancy of his views and steadiness of his application formed the principal characteristics of his genius. Already he had reached the known limits of the mathematical analysis; he was then master of all that was most ingenious or most powerful in that science; and no one seemed more capable than he of enlarging its domain. Having resolved a capital question of theoretical astronomy, he formed the design of consecrating his efforts to that sublime science, which he was destined to perfect, and which he alone could embrace in its full extent. He meditated deeply his glorious design; and he passed his whole life in accomplishing it, with a perseverance of which the history of the sciences scarcely presents any similar example.

The immensity of the subject flattered the just pride of his genius. He undertook to compose the *Almagest* of his age, we mean the work which he has left us under the title of *Traité de Mécanique Céleste;* a work which is as superior to that of Ptolemy, as the analytical science of the moderns surpasses the elements of Euclid. Time, which alone dispenses literary glory with justice, and which consigns to oblivion contemporary mediocrity, perpetuates the remembrance of great works. It is they only which carry to posterity the character of each age. Thus the name of M. de Laplace will live throughout all ages. But enlightened and faithful history will not separate his renown from that of the other successors of Newton. It will unite in one and the same series the illustrious names of D'Alembert, Clairaut, Euler, Lagrange, and Laplace. After Euler, Lagrange contributed most largely to found the mathematical analysis, which, in the writings of these two great geometricians, became a distinct science, the only one of the mathematical theories of which it could be said that it had been completely and rigorously demonstrated. Lagrange was born to invent and to enlarge all the sciences of calculation. If he had been the contemporary of Archimedes and of Conon, he would have shared the glory of the most memorable discoveries; and at Alexandria he would have been the rival of Diophantes.

M. de Laplace had received from nature all that force of genius which was required for an immense enterprise; and in his *Almagest* of the nineteenth century, he has not only comprised all that had previously been discovered in the mathematical and physical sciences, and which serves as the foundation of astronomy; but he added to this science capital discoveries peculiar to himself, and which had escaped all his predecessors. Either by his own methods, or by those of which Euler and Lagrange had previously indicated the principles, he resolved questions the most important, and certainly the most difficult of all those which had been considered before his time. Thus, in the motions of the moon he discovered an acceleration of which no one had previously been able to explain the cause. It had been supposed that this effect might proceed from the resistance of the ethereal medium in which the heavenly bodies revolved. But if this were so, the same cause, affecting the courses of the planets, would tend more and more to change the primitive order. These stars would be incessantly disturbed in or deflected from their orbits, and would end by precipitating themselves upon the mass of the sun; and it would be necessary for the creative power to interpose anew in order to prevent or to repair the immense confusion which the lapse of time had produced. This cosmological question was assuredly one of the greatest which the human mind could propose to itself; and it is now completely resolved. The early researches of M. de Laplace respecting the invariability of the dimensions of the solar system, and his explanation of the secular equation of the moon, conducted him to this solution.

He had at first inquired if the acceleration of the lunar movement could be explained by supposing that the action of gravity was not instantaneous, but subjected to a successive transmission, like that of light. In this way, however, he could not discover the true cause. But a new investigation, based upon a sounder principle, led him to the desired object; and, on the 19th of March 1787, he gave to the Academy of Sciences a clear and unexpected solution of this capital difficulty, proving distinctly that the acceleration observed is a necessary effect of universal gravitation. This great discovery threw new light upon the most important points in the system of the world. From it he deduced, that if the action of gravitation on the stars was not instantaneous, this principle must be propagated at least fifty million times more rapidly than light, the velocity of which is seventy thousand leagues a second. He also concluded that the medium in which the heavenly bodies revolve opposes no sensible resistance to the courses of the planets; since this cause would especially affect the motion of the moon; in which, however, it produces no observable effect. The same principle is also fertile in remarkable consequences. It follows from it, that the motion of rotation of the earth on its own axis is invariable. The duration of the day has not changed the hundredth part of a second during two thousand years. The distance of the sun from the earth may also be deduced with certainty from the assiduous observation of the lunar motions. But the most striking consequence, perhaps, is that which relates to the figure of the earth, the form of which is imprinted in certain inequalities in the course of the moon, which could not have taken place if the earth had been perfectly spherical. The quantity of the terrestrial oblateness may be determined from the lunar movements alone; and the results which have been deduced from these agree with the actual measures which have been obtained from geodesical operations at the equator, in the northern regions of Europe, in India, and in various other countries.

"The explanation of the moon's acceleration," says Professor Playfair, in his masterly and eloquent review of the *Système du Monde*, "and the proof that it is not constantly increasing, but merely a periodical inequality, is a great step in the philosophy of the heavens. The continual increase of the moon's angular velocity, which this phenomenon seemed to indicate, argued a constant diminution of her distance from the earth, and gave some countenance to the notion that the planetary orbits were continually diminishing, and that there was, amongst the bodies of our system, a tendency to descend to the centre of gravity of the whole, where their union must finally terminate the present order of nature. To this catastrophe an elegant and philosophic poet has beautifully alluded.

> Roll on, ye stars, exult in youthful prime,
> Mark with bright curves the printless steps of time;
> Near and more near your beamy cars approach,
> And lessening orbs on lessening orbs encroach.
> Flowers of the sky! ye too to age must yield,
> Frail as your silken sisters of the field!
> Star after star from heaven's high arch shall rush,
> Suns sink on suns, and systems systems crush;
> Headlong, extinct, to one dark centre fall,
> And death, and night, and chaos mingle all:
> Till o'er the wreck, emerging from the storm,
> Immortal Nature lifts her changeful form;
> Mounts from her funeral pyre on wings of flame,
> And soars and shines another and the same.[1]

The destiny of nature is, however, more noble than that which this magnificent description holds up to the fancy; and the algebraist has extracted from his calculus a more sublime conclusion than the invention of a poet has been able to attain. The constancy of nature, amidst all the changes she undergoes, is upheld by the constitution of those changes, which prescribes to each its limits, and forces it to recur in a series, which in time reduces to nothing the sum of all the deviations from the mean. Thus, the amount of the whole is permanent, though the terms themselves are perpetually changing; and hence nature is rendered immortal, not by emerging from the storm, but by being ever superior to its power; its order is not renovated, but preserved; and the wisdom of its Author has provided an antidote to evil, that renders all remedies unnecessary."[2]

We cannot undertake to indicate here the continuation of his labours, and the discoveries which resulted from them. The bare enumeration, however rapid, would exceed the limits prescribed to us. Besides his researches on the secular equation of the moon, and the discovery, not less important and difficult, of the cause of the great inequalities of Jupiter and of Saturn, we would require to cite his admirable theorems on the libration of the satellites of

---

[1] Darwin's *Botanic Garden*, cant. iv. p. 1.

[2] *Edinburgh Review*, vol. xv. pp. 411, 412.

Jupiter, to recall his analytical labours on the flux and reflux of the sea, and to show the immense extent which he has given to that question. In fact, there was no point of importance in physical astronomy which he did not make the object of profound study and discussion; and he subjected to calculation the greater part of the physical conditions which his predecessors had omitted. In the question, already so complex, of the form and the motion of rotation of the earth, he considered the effect of the presence of the waters distributed between the continents of land, the compression of the interior strata, and the secular diminution of the dimensions of the globe. Amongst these researches may also be remarked those which relate to the stability of the grand phenomena of nature. No subject can possibly be more worthy the attention of philosophers. Thus, it has been ascertained that the causes, whether fortuitous or constant, which disturb the equilibrium of the seas, are subjected to limits which cannot be passed. The specific gravity of the waters being much less than that of the solid earth, it follows that the oscillations of the ocean are always included within very narrow limits, which would not happen if the liquid diffused over the globe was much more heavy. In general, nature keeps in reserve conservative forces, which, being always present, act as soon as the disturbance commences, and with a vigour proportioned to the alteration, until the accustomed order has been re-established. In the primitive and liquid state of the terrestrial globe, the heaviest substances must, by their own weight, have approached nearest the centre; and this condition has determined the stability of the seas.

Whatever may be the physical cause of the formation of the planets, it has impressed upon all these bodies a motion of projection in the same direction around an immense globe; and by this motion the solar system has become stable. The same effect is produced in the system of the satellites and the rings. In these, order is also maintained by the power of the central mass. It is not, then, as Newton and Euler had both suspected, an adventitious force, which might one day repair or prevent the disturbance caused by time. It is the law of gravitation itself; a law which regulates all, is sufficient for all, and maintains variety and order amongst all. Having once emanated from the supreme wisdom, it has presided since the origin of time, and rendered all disorder impossible. Newton and Euler did not know all the perfections of the universe. In general, as often as any doubt has arisen in regard to the universality of the Newtonian law, and the accession of some new cause has been proposed to explain apparent irregularities, it has always happened that, after a profound investigation, the primordial law has been verified. It now explains all the known phenomena. The more precise observations have become, the more conformable they are found to be to the theory of gravitation. Of all geometricians, M. de Laplace is the one who has most profoundly investigated these great questions, which, if we may so express it, he has also terminated. It cannot indeed be affirmed that it was given to him to create an entirely new science, like Archimedes and Galileo; or to give to mathematical doctrines original principles and an immense extent, like Descartes, Newton, and Leibnitz; or, like Newton, to be the first to transport to the heavens, and extend throughout the whole universe, the terrestrial dynamics of Galileo. But, to use the words of Baron Fourier, M. de Laplace was born "pour tout perfectionner, pour tout approfondir, pour reculer toutes les limites, pour résoudre ce que l'on aurait pu croire insoluble." He would have completed the science of the heavens, if that science could have been completed.

Professor Playfair thus sums up his analysis of the great work of Laplace, the *Traité de Mécanique Céleste*, wherein the discoveries which had first been communicated by the author, in the Memoirs of the Academy of Sciences, are brought together into one view, and the general results deduced from them by one uniform method of investigation.

"Such is the work of Laplace," says he, "affording an example, which is yet solitary in the history of human knowledge, of a theory entirely complete; one that has not only accounted for all the phenomena that were known, but that has discovered many before unknown, which observation has since recognised. In this theory, not only the elliptic motion of the planets, relatively to the sun, but the irregularities produced by their mutual action, whether of the primary on the primary, of the primary on the secondary, or of the secondary on one another, are all deduced from the principle of gravitation, that mysterious power, which unites the most distant regions of space, and the most remote periods of duration. To this we must add the great truths brought into view and fully demonstrated, by tracing the action of the same power through all its mazes:—That all the inequalities in our system are periodical; that, by a fixed appointment in nature, they are each destined to revolve in the same order, and between the same limits; that the mean distances of the planets from the sun, and the time of their revolutions round that body, are susceptible of no change whatsoever; that our system is thus secured against natural decay,—order and regularity preserved in the midst of so many disturbing causes,—and anarchy and misrule eternally proscribed.

"The work where this sublime picture is delineated, does honour, not to the author only, but to the human race; and marks, undoubtedly, the highest point to which man has yet ascended in the scale of intellectual attainment. The glory, therefore, of having produced this work, belongs, not to the author alone, but must be shared, in various proportions, among the philosophers and mathematicians of all ages. Their efforts, from the age of Euclid and Archimedes, to the time of Newton and Laplace, have all been required to the accomplishment of this great object; they have been all necessary to form one man for the author, and a few for the readers, of the work before us. Every mathematician who has extended the bounds of his science; every astronomer who has added to the number of facts, and the accuracy of observation; every artist who has improved the construction of the instruments of astronomy,—all have co-operated in preparing a state of knowledge in which such a book could exist, and in which its merit could be appreciated. They have collected the materials, sharpened the tools, or constructed the engines employed in the great edifice, founded by Newton, and completed by Laplace.

"In this estimate we detract nothing from the merit of the author himself; his originality, his invention, and comprehensive views, are above all praise; nor can any man boast of a higher honour, than that the Genius of the human race is the only rival of his fame."[1]

The same general character is exemplified in his researches on the analysis of probabilities; a science altogether modern, but of immense extent, and one the applications of which will one day embrace the whole range of human knowledge, forming a happy supplement to the imperfection of our nature. The doctrine of probabilities owes its origin to a single glance of the intuitive and fertile genius of Pascal; and it was from the first cultivated by Fermat and Huygens. A geometrician and philosopher, James Bernoulli, was its principal founder. A singularly happy discovery of Stirling, the researches of Euler, and, above all, an ingenious and important application made by Lagrange, improved this doctrine; whilst new light was shed upon it by the objections of D'Alembert, and by the philosophical views of Condorcet. But it was reserved for M. de Laplace to collect and to fix its principles. In his hands it became a new science, subjected to a single analytical method, and of prodigious extent. Fertile in useful applications, this science will one day serve to illustrate all the branches of natural philosophy.[1]

---

[1] *Edinburgh Review*, vol. xi. pp. 277, 278.

After what has been said of these brilliant discoveries, it is scarcely necessary to add, that M. de Laplace was a member of all the learned academies of Europe. He was also invested with high political dignities. After the 18th Brumaire, the First Consul appointed him minister of the interior; but in this office, it appears, he gave little satisfaction. "A geometrician of the first class," says Napoleon, "he did not reach mediocrity as a statesman. From the first, the consuls became sensible they had made a mistake in the appointment. He never viewed any subject in a true light; he was always occupied with subtleties; his notions were all problematic; and he carried the spirit of the *infiniment pétit* into the administration." Accordingly, at the end of six weeks, he surrendered to Lucien Bonaparte the portefeuille of his office. But he was created a senator, then made vice-chancellor, and at length chancellor of the conservative senate, and at the same time a member of the legion of honour. In 1805, he presented a report to the senate, in which he proved the necessity of restoring the Gregorian calendar, and abolishing that of the republic. In 1814, he voted for the abdication of Napoleon, an act which reflects no great honour on his memory. During the Hundred Days he did not make his appearance at the Tuilleries, apprehensive, no doubt, of being reproached with tergiversation and ingratitude. Soon after the restoration, he was created a peer of France with the title of Marquis; an honour for which he was more indebted, perhaps, to the vote he had given in 1814, than to all his eminence in science. But the immortal author of the *Mécanique Céleste* required none of those arbitrary and adventitious distinctions, which are so often the reward of political subserviency. His genius and his fame were incapable of receiving any secondary or reflected illustration. The only points of real importance in his life are the eternal truths which he discovered, not the dignities with which he was invested; the immutable laws of the stability of the world which he unfolded, not the rank which he for several years held in the senate called conservative; and the example which he has left to all those who cultivate the sciences of patient thinking and incomparable perseverance.

M. de Laplace enjoyed an advantage which fortune does not always afford to great men. From his early youth, his merits were fully appreciated by his illustrious friends. D'Alembert, as we have seen, lost no time in introducing him to the Military School of France, and in providing for him, had it been necessary, a better establishment at Berlin. The President Bochard de Saron caused to be printed, at his own expense, the early works of Laplace. All the testimonies of friendship which were given him recall great labours and great discoveries; but nothing could contribute more to the progress of physical knowledge than his relations with the illustrious Lavoisier, whose name, hallowed in the history of the sciences, has become an object of eternal respect and sorrow. These two celebrated men combined their efforts for the advancement of science. They undertook and completed extensive researches, in order to measure one of the most important elements of the physical theory of heat. They made also, about the same time, a long series of experiments on the dilatations of solid substances. The works of Newton show the importance which that great geometrician attached to the special study of the physical sciences. Of all his successors, M. de Laplace is the one who has made most of his experimental method; he was almost as great a natural philosopher as a geometrician. His researches on refraction, capillary attraction, barometrical measurements, the statical properties of electricity, the propagation of sound, molecular action, and the properties of gas, prove that every thing connected with the investigation of nature was familiar to him. He desired above all things the perfection of instruments, and caused to be constructed, at his own expense, by a celebrated artist, a valuable astronomical instrument, which he presented to the Observatory of France.

All sorts of phenomena were perfectly known to him. He was connected by ancient friendship with two natural philosophers, whose discoveries have thrown light upon all the arts and all the chemical theories. History will associate the names of Berthollet and of Chaptal with that of M. de Laplace. He took pleasure in meeting them together, and the conversations which then ensued had all for their object the advancement of science. The gardens of Berthollet at his house at Arcueil were contiguous to those of M. de Laplace. Interesting recollections and great regrets have illustrated this locality. It was there that Laplace received celebrated foreigners, and men in power, from whom science had received, or hoped to receive, benefits, but, above all, those whom a sincere zeal had attached to the sanctuary of the sciences. He received all with extreme politeness—those who were just commencing their career, as well as the veterans who were soon to finish it; and he carried this so far, that persons who did not know the full extent of his genius would perhaps have supposed that he derived some advantage from their conversation.

In referring to the mathematical works of M. de Laplace, we have particularly noticed the depth of his researches and the importance of his discoveries. But these works are distinguished by another quality, which all readers have appreciated, we mean the literary merit of the composition. The *Système du Monde*, in particular, is remarkable for the elegant simplicity of the style and the purity of the language. There had hitherto been no example of a work of this kind; but it would be a mistake to suppose that a real knowledge of the phenomena of the heavens can be acquired from such writings. The suppression of the signs peculiar to the language of the calculus cannot conduce to clearness, or render the perusal more easy. The work is a perfectly regular exposition of the results of profound study; it is an ingenious and admirable summary of the principal discoveries. The precision of the style, the choice of the methods, the grandeur of the subject, give a singular interest to this vast picture; but its real utility consists in recalling to geometricians the theorems, the demonstrations of which were previously known to them. "C'est, à proprement parler," says M. Fourier, "une table de matières d'un traité mathématique." The purely historical works of Laplace have another object. He therein presents to geometers, with admirable talent, the progress of the human mind in the invention of the sciences. The most abstract theories have, in fact, a beauty of expression which is peculiar to them. This is what may be observed in several treatises of Descartes, and in some pages of Galileo, of Newton, and of Lagrange. The novelty of the views, the elevation of the thoughts, and their relation to the great objects of nature, attach and occupy the mind. It is sufficient that the style be pure, and of a noble simplicity. It is this species of literature which M. de Laplace selected; and it is certain that he placed himself in its first rank. If he writes the history of great astronomical discoveries, he becomes a model of elegance and precision. No leading feature of the subject ever escapes him, and the expression is never either ambitious or obscure. Every thing that he calls great is in fact great; whatever he omits does not deserve to be mentioned.

---

[1] See an admirable account of the *Essai Philosophique sur les Probabilités* (which is only an abstract of the large work by the same author, entitled *Théorie Analytique des Probabilités*, Paris, 1812), in the *Edinburgh Review*, vol. xxiii. p. 320, *et seqq.* and which is known to have proceeded from the pen of Professor Playfair.

M. de Laplace retained at a very advanced age that extraordinary memory for which he had been so remarkable from his earliest years; a precious endowment, which, though not genius itself, enables genius to acquire and to preserve. He had not cultivated the fine arts, but he appreciated them. He loved the music of Italy and the verses of Racine; and he often amused himself in reciting from memory various passages of that great poet. The compositions of Raffaelle adorned his apartments. Beside them were the portraits of Descartes, Vieta, Newton, Galileo, and Euler. M. de Laplace had always accustomed himself to a light diet, which he diminished more and more even to excess. His very delicate sight required continual precautions, and he succeeded in preserving it without any alteration. His care of himself had never any other object than that of reserving all his time and all his powers for the labours of the mind. He lived for the sciences, and the sciences in return have rendered his memory immortal.

At the commencement of the malady which ultimately carried him off, his friends observed with dismay an instant of delirium. But even in that state the sciences still occupied him. He spoke with unusual ardour of the motion of the stars, and then of an experiment in physics, which he declared to be a capital one; announcing to the persons he believed to be present, that he would soon communicate these questions to the Academy. Meanwhile his strength rapidly declined. His physician, Majendie, who merited all his confidence by superior talents, and by those attentions which friendship alone could inspire, watched beside his bed. M. Bouvard, his fellow-labourer and friend, never quitted him for an instant. The persons who attended him at his last moments recalled the titles of his glory, and spoke of his most splendid discoveries. "What we do know," replied the dying man, "is a small matter; what we do not know is immense." This is all that could be collected; these were the last articulate expressions that dropped from his lips. He soon afterwards expired without pain; the powerful genius which had so long animated him separated itself from its mortal habitation, and returned to the God who gave it. He died on the 5th of March 1827, in the seventy-eighth year of his age.

The successors of this great man will see accomplished the phenomena, the laws of which he discovered. They will observe in the lunar motions the changes which he has predicted, and of which he alone could assign the cause. The continual observation of the satellites of Jupiter will perpetuate the memory of the inventor of the theorems which express the laws according to which their courses are regulated. The great inequalities of Jupiter and of Saturn, pursuing their long periods, and giving to these planetary stars new situations, will incessantly recall one of his most astonishing discoveries. These are the titles of a true glory, which nothing can ever destroy. The spectacle of the heavens will be changed; but, at the remote epoch when this shall occur, the glory of the discoverer will remain unchanged. The traces of his genius bear the stamp of immortality.

The following list of the works of M. de Laplace, for which we are chiefly indebted to *La France Littéraire* by M. Quérard, includes not only the titles of his different publications which appeared in a separate form, but also those of the numerous memoirs with which, during a period extending to rather more than half a century, he enriched the collections of the Academy and the Institute, and the Journal of the Polytechnic School:—

1. *Essai Philòsophique sur les Probabilités*, Paris, 1814, in 4to. Another edition of this work was published the same year in 8vo, and the work was reprinted in 1816, 1819, and 1825. The *Essai Philosophique* is merely an abstract of the large work on the same subject.

2. *Exposition du Système du Monde*, in five books, the fifth edition, revised and augmented by the author, Paris, 1824, in 4to, and in two vols. 8vo. The first edition of this work appeared in 1796, in two vols. 8vo. In five books the author treats, 1st, of the apparent motions of the heavenly bodies; 2d, of the real motions of those bodies; 3d, of the laws of their motions; and, 4th, of the theory of universal gravitation. The fifth book contains an abridgment of the history of astronomy.

3. *Précis de l'Histoire de l'Astronomie*, Paris, 1821, in 8vo. This is merely the fifth book of the fifth edition of the *Exposition du Système du Monde*, published separately.

4. *Théorie Analytique des Probabilités*, third edition, revised and augmented by the author. The first edition of this work appeared in 1812, in 4to. From 1816 to 1825 M. de Laplace published four supplements, which the publisher, after having sold them for some years separately, added to the volume to which they now serve as a complement. These supplements treat, 1st, of the application of the calculus of probabilities to natural philosophy; 2d, of the application of the calculus of probabilities to geodesical operations; and, 3d, of the application of geodesical formulæ of probability to the meridian of France. The fourth contains an abridgment of the theory of probabilities.

5. *Théorie des Attractions Sphéroïdes, et de la Figure des Planètes*, Paris, 1785, in 4to. This is a memoir extracted from the collection of the Academy of Sciences.

6. *Théorie du Mouvement et de la Figure elliptique des Planètes*, Paris, 1784, in 4to. This work was printed at the expense of President Bochard de Saron, who only caused two hundred copies to be struck off, for the purpose of being distributed gratuitously.

7. *Traité de Mécanique Céleste*, in sixteen books, Paris, 1799–1825, in five vols. 4to, with four supplements published at different times. The first book treats of the general laws of the equilibrium of motion; the second, of the law of universal gravitation, and the motion of the centres of gravity of the heavenly bodies; the third, of the figure of the heavenly bodies; the fourth, of the oscillations of the sea and the atmosphere; the fifth, of the motions of the heavenly bodies around their proper centres of gravity; the sixth, of the theory of the planetary motions; the seventh, of the theory of the moon; the eighth, of the theory of the satellites of Jupiter, Saturn, and Uranus; the ninth, of the theory of comets; the tenth, on different points relative to the system of the world; the eleventh, on the figure and rotation of the earth; the twelfth, on the attraction and repulsion of spheres, and the laws of the equilibrium and motion of elastic fluids; the thirteenth, on the oscillation of the fluids which cover the planets; the fourteenth, on the motions of the heavenly bodies around their centres of gravity; the fifteenth, on the motions of the planets and the comets; and the sixteenth, on the motions of the satellites. A second edition of the first two volumes of this work was published at Paris in 1829, 1830. In this country no attempt has yet been made, so far as we know, to translate the *Traité de Mécanique Céleste* into English; but, in 1830, an English translation of the first volume, with a commentary, was published at Boston in the United States of America. Both the translation and

the commentary are by Dr Bowditch of Boston; but the amount of the latter is out of all proportion to the text, being intended to enable persons but moderately skilled in the mathematics to comprehend the profound analytical investigations of the great astronomer, and to follow him to his beautiful and striking results.

8. Besides the works which we have just enumerated, M. de Laplace is also the author of a series of very important Memoirs, in which, from 1772 to 1823, he published the collections of the old and the new Academy of Sciences, that of the Institute, and the Journal of the Polytechnic School. The subjects of these Memoirs are exceedingly various. We give the following list in the chronological order of their impression, viz. 1. On the Particular Solutions of Differential Equations, and on the Secular Inequalities of the Planets, 1772; 2. On the Integral Calculus, and on the System of the World, 1772; 3. On the Integral Calculus of Partial Differences, 1773; 4. On recurring Series, and their Uses in the Theory of Chances, 1774; 5. On the Probability of Causes afforded by Events, 1774; 6. On some Points in the System of the World, 1775 and 1776; 7. On the Integration of Differential Equations with Finite Differences, 1776; 8. On the mean Inclination of the Orbits of Comets, id.; 9. On the Use of the Calculus of Partial Differences in the Theory of recurring Series, 1777; 10. On the Precession of the Equinoxes, id.; 11. On the Integration of Differential Equations by Approximation, id.; 12. On Probabilities, 1778; 13. On Series, 1779; 14. On the Determination of the Orbits of Comets, id.; 15. On Heat, id.; 16. On the Electricity which Bodies absorb when reduced to Vapour, 1781; 17. On the Approximations of Formulæ which are functions of very great numbers, 1782, 1783; 18. On the Figure of the Earth, 1783; 19. On the Births, Marriages, and Deaths at Paris from 1772 to 1784; 20. On the Population of France, and the Number of Inhabitants in the Country, 1783–1788; 21. On the Secular Inequalities of the Planets and of the Satellites, 1784; 22. Theory of Jupiter and of Saturn, 1787; 23. On the Secular Equation of the Moon, 1786; 24. On the Theory of Saturn's Ring, 1787; 25. On the Secular Variations in the Orbits of the Planets, id.; 26. Theory of the Satellites of Jupiter, 1788, 1789; 27. On the Theory of the Satellites of Jupiter, 1789; 28. On the Flux and Reflux of the Sea, 1790; 29. On the Determination of a Plane which remains always parallel to itself, in the movement of a system of bodies acting upon each other in any manner whatsoever, and free from all foreign action, 1798; 30. On Mechanics, id.; 31. On the Motions of the Heavenly Bodies round their Centres of Gravity, id.; 32. On the Secular Equations of the Motions of the Moon, of her Apogee, and of her Nodes, 1799; 33. On the Motion of the orbits of the Satellites of Saturn and Uranus, 1801; 34. On the Theory of the Moon, id.; 35. On Different Points of Analysis, 1809; 36. On the Motion of Light in Diaphanous Media, id.; 37. On the Approximations of the Formulæ which are functions of very great numbers, and on their application to Probabilities, id.; 38. On the Figure of the Earth, 1817; 39. On the Flux and Reflux of the Sea, 1818; 40. Addition to the Memoir on the Figure of the Earth, id.; 41. On the Developments of the true Anomaly, and of the Elliptical Radius Vector, in series arranged according to the powers of the eccentricity, 1823. Lastly, the Marquis de Laplace contributed, in the mathematical department, to the *Leçons de l'Ecole Normale.*

(See *Eloge Historique de M. le Marquis de Laplace*, by Baron Fourier, in the *Mémoires de l'Académie Royal des Sciences de l'Institut de la France*, tom. x. p. lxxxi.; Quérard, *La France Littéraire*, art. LAPLACE; *Revue Encyclopédique*, tom. xxxiii. p. 880; *Edinburgh Review*, vol. xi. p. 249, et seqq. vol. xv. p. 396, et seqq. and vol. xxiii. p. 320, containing masterly criticisms on the *Mécanique Céleste*, the *Exposition du Systême du Monde*, and the *Essai Philosophique sur les Probabilités;* and Dissertations Third and Fourth, prefixed to the present work.) (A.)

LAPLAND, the most northerly country of Europe, is bounded on the north by the Arctic Ocean, on the south by Sweden, on the east by the White Sea, and on the west by Norway and the Atlantic Ocean. Its limits are not very accurately laid down by travellers or geographers; but it seems to be divided from the rest of Scandinavia by a line nearly corresponding with the polar circle, in latitude 66. 32. and is consequently almost entirely an arctic region. North Cape, its most northerly point, is situated in latitude 71. 10. 15. consequently its length from north to south is about 330 miles, and not 500, as is usually stated. From Cape Orlov, on the White Sea, to the Atlantic on the west, it extends about 700 miles; but, besides this continental territory, there are a vast number of islands which are included in the general name of Lapland. The whole country is divided into three parts, called Russian, Swedish, and Norwegian Lapland or Finmark, and is recognised by the Swedes and Norwegians by the name of Lapmark, *mark* signifying, both in Swedish and Norse, land or tract of country. The very early writers, however, do not notice any country under the name of Lapmark, whilst Finmark is alluded to, though not with such clearness as would admit of our defining the exact extent of country which went by that appellation. It has been conjectured that, in former ages, the parts of the north now known by the names of Swedish and Russian Lapland, were distinguished as Russian and Swedish Finmark, previously to the period when the Finns obtained the name of Lapper or Laplanders. Throughout Norway and Finmark they are uniformly termed Finns, which was their ancient and most proper designation; it is only in Sweden, and Swedish and Russian Lapland, that the name of Lap is given to the inhabitants of the country. They were called Lappes by Laxo in the twelfth century; but still the etymology of the word is thus very obscure, though circumstances seem to favour the supposition that the term Lap was applied to this race of people by their neighbours the Swedes, and hence was transferred to the country which they inhabited. In the old Russian annals they are always styled *Lepori*, a word most probably of Finnic origin. Finmark, which forms the most northern part of this wild and extensive territory, constitutes one extremity of the kingdom of Norway, to which it now belongs; though doubtless in ancient times it was a separate kingdom, governed by its own sovereigns. Its present boundary on the west is Loppen, the first island in Finmark, and which forms a line between it and the Nordlands, a part of Norway sometimes erroneously confounded with Lapland. On the north-west and north-east it is washed by the Polar Ocean, whilst to the east it is bordered by Russian Lapland, which also, with Nordland, bounds it to the south; the boundary line between the two countries being the river Tana. Its extent from north to south, that is, from the borders of Russian Lapland to the North Cape, is nearly three degrees of latitude; its greatest breadth being from west to east, namely, from the western side of Faroe to the coast above Waranger, near the borders of Russian Lapland. At the eastern extremity of Finmark there is a considerable tract, to which both Norway and Russia lay claim. It lies between the acknowledged boundaries of each of these powers, and being now considered as neutral ground, is free to the Laplander of both countries to hunt and fish in. This district extends a little to the westward of Bugefiord, stretching nearly south to the Enara Lake, where it bends to the east, and afterwards to the north-east, where it joins the coast. Russian Lapland lies to the south and east of the debateable ground above mentioned. The river Muonio, which for a considerable portion of its early course receives the name of the Köngärnäelf, constitutes the boundary between Sweden and Russia. The circle of Kola, and the northern part of Eastern Kemi, constituted at one time Russian Lapland; but, by subsequent treaties, two extensive districts, all the Lapmark of Western Kemi, and the greater part of the Lapmark of Torneo, have been ceded to Russia. Thus nearly two thirds of the regions inhabited by the Laplanders are included in the dominions of the emperor of Russia. Swedish Lapland, the most southerly division, occupies the interior part of the country to the west of the river Torneo; the maritime district of Nordland, a portion of Norway, being situated between it and the North Sea. How much of the northern part of Sweden is entitled to be called Swedish Lapland, it is impossible to say. If the arctic circle be taken as the boundary line, only that portion of Sweden called North Bothnia can be considered as belonging to Lapland; but Pitea Lapmark and Umea Lapmark are sometimes mentioned as forming part of the latter country, and these are situated in West Bothnia. The cause of error may be traced to the circumstance of these nomadic tribes frequently inhabiting, at least for a portion of the year, districts of country far down in the interior of Sweden and Norway. Thus, in the latter country, the Roraas Mountains, situated between Christiania and Drontheim, are inhabited, during summer at least, by a family of Laplanders, with the never-failing herd of rein-deer. But the exact boundary line is not very material, as it has reference only to different portions of a tract of country which is under one government.

Mountains.

Lapland is not intersected by alps or very high mountains, as is sometimes asserted; but, from Nordland onwards, the whole region is a table-land, crowned only on its western frontier with a mountainous chain, which forms the extremity of the Scandinavian Alps, and descends from Sulitelma, of which the elevation is 6760 feet, to the height of Norwegian Finmark. These are about 3600 feet high on the continental coast, and nearly 4000 on some islands. The sea-coast presents a remarkably bold and rugged, if not magnificent appearance. Mountain is seen piled on mountain in stern grandeur, and white with the snows of ages; and the sublimity of the scene is enhanced by the myriads of islands which are scattered in an extraordinary manner along the Norwegian and Lapland coast, as far as North Cape. Ravines and valleys intersect the interior; the elevation of the highest plains has been estimated at about sixteen hundred feet, but towards the east and the south they descend. Rocks and hills rise from the table-land, varying, to the east of 18° west longitude, from 2000 to 2400 feet above the level of the sea, but only from 500 to 600 feet above their base. These hills are rather isolated groups than a continuous chain; and at twenty leagues to the south of them the streams and rivers separate in different directions between the North Sea and the Bothnian Gulf, and between the Gulfs of Alten and Torneo. The central ridge is supposed to descend without interruption to the entrance of the White Sea, and that part of Lapland consists of extensive marshes, studded with rocks. These have been called the Koelin Mountains, and, strictly speaking, may be said to form one great chain; but the branches which it casts off to the right and to the left, the mountainous isles of Lofoden, which are merely the summits of some of its branches, and the mountains which terminate near Lake Enara in Russian Lapland, entitle it to the name of a group. Other ranges of hills, which traverse Lapland, and are connected with Finland, are lost round the numerous lakes in that country. Sulitelma, already mentioned, is the highest mountain in Lapland. The islands of Waag and Hurd have each heights rising 4264 feet above the level of the sea; and a glacier on the island of Seyland is 4155 feet high. The mineralogical structure of the Lapland Mountains has not been thoroughly ascertained. M. de Buch informs us that the hills which he examined on the higher part of the table-land are composed of granite and gneiss. The latter rock is said to be by far the most abundant in Scandinavia, all the other primitive rocks appearing in some degree subordinate to it. Quartz is very abundant on the island of Mageröe. On the Dovrefield, and other mountains, it is met with in scattered blocks; but at the North Cape the surface of the ground is wholly covered with it. M. de Buch also observed, in an excursion which he made towards the Gulf of Bothnia, a succession of calcareous and schistose rocks. These substances likewise abound in the country between the last-named gulf and that of Kandala. The land is intersected with ravines, but its elevation is inconsiderable. The whole region is supposed to rest on a base of red *decomposable* granite, or, as it is generally called by the natives, *rapakivi.* There is abundance of metal found in Lapland, particularly iron, of which whole mountains exist in that part of the country belonging to Sweden. Copper, lead, zinc, silver, and even traces of gold, have been found; but iron ore is the chief mineral treasure of the country, and might assist in introducing cultivation and an extensive trade into this desert portion of Europe, did not the scarcity of timber, and the great difficulty of conveying goods, constitute insuperable obstacles to the working of the mines in the inland and eastern parts of the country, where it would appear to be most abundant. The marshy lands are impregnated with this valuable metal, and in gneiss it occurs in beds which are sometimes nearly forty feet in thickness. Numerous minerals are found in Lapland; rock crystal in particular is very common, and the inhabitants occasionally dispose of it for amethysts and topazes.

Lakes and rivers.

There are numerous lakes and rivers in Lapland. Of the latter, several take their rise in the Koelin Mountains, and flow in various directions into the Atlantic Ocean or the Gulf of Bothnia. The principal rivers of the country are the Tana or Tarna, which takes a north-eastern course through Finmark, and empties itself into a bay or sound of the same name; the Alten or Alata, which is very rapid, forcing its way through the mountains of Finmark in a north-westerly direction, empties itself into a bay of the same name; the Torneo, which issues from a lake so named, and, after being enlarged by a number of streams uniting in one channel and running nearly due south through a long course, falls into the northern extremity of the Bothnian Gulf at Torneo; and the Muonio, which rises from the Killpis Jaure, at the foot of the alpine chain of Norway, is a considerable stream, and constitutes the boundary line between Sweden and Russia, till it unites with the river Torneo, when the latter marks the limits of either country in this quarter. There are also other rivers which take their rise in Lapland, and fall into the Gulf of Bothnia, such as the Lulea, Pitea, Kalix, and others. In Russian Lapland there are several considerable streams, but these have not been so well defined, nor has this part of Lapland been so fully described, as the others. The Kemi takes its rise amongst the Kemi Mountains, situated near the centre of the country, and flows into the Gulf of Bothnia. It has many imposing cataracts, of which the *Taival Koski*, or the fall of the heavens, is the only one which the adventurous boatmen never attempt to cross. The *Passe*, or holy stream, is the outlet of the great lake Enara, flowing thence to the Arctic Ocean. The eastern declivities of Russian Lapland are watered by the Panoi, which discharges itself into the White Sea. The Tuloma falls from a great height, enters the lake Kola, which name it afterwards takes, and falls into Kola Bay, on the Arctic Ocean. Besides these, there are numerous other rivers which traverse the country in various directions, and either give rise to lakes, or issue from them. The abundance of lakes is the most prominent feature of Lapland, as it generally is of all countries situated in such latitudes. Sometimes these sheets of water occur singly, sometimes in chains, and many of them are of considerable size; but there exists such a confusion of nomenclature, that it is difficult to distinguish one from another, and apply to each its proper designation.[1] Very often the rivers, such as the Muonio, become so broad in some parts, as often to assume the appearance of lakes, and there is little doubt they have occasionally been so termed. The most considerable lakes are, the Enara, in Russian Lapland, which is about forty miles in length by sixteen in breadth; the Imandra, which has an elevation of four hundred feet above the level of the sea, and is discharged into the Gulf of Kandala; the Biggi Lobee, and Biggi Jaure, one or other of which, Sir Capel Brooke supposes, is that designated by Von Buch the Jess Jaure; and many others which do not require to be enumerated. Besides these inland bodies of water, the shores are indented by extensive *fiords* or arms of the sea, which frequently run thirty, or even forty miles into the heart of the country.

Finmark and Swedish Lapland, including all the modern provinces belonging to Russia, have been carefully examined by Wahlenberg and De Buch, and the vegetable kingdom distinguished into six zones, concentric with the Gulf of Bothnia, each differing from the others in climate and productions. The first or lower region of the forests rises from the level of the sea to the height of five hundred feet, forming a zone generally eighty miles in breadth; and here the spruce and Scotch fir abound. The second is higher and colder than the first, rising from five hundred to eight hundred feet, and being generally only from six to eight miles in breadth. This portion has been denominated the upper region of the forests, and here the Scotch fir is still found, but the other plants disappear. The third is higher than any of the preceding, rising from 800 to 1200 feet, and for the most part about twelve miles in breadth, excepting at one place, where this becomes very great. The fir here is rarely seen, but pines are abundant. The fourth or subalpine region, rising from 1200 to 1800 feet, is a zone of about the same dimensions as the preceding, and contains birch, but coniferous trees do not grow there. The fifth is called the alpine region, or the country of the dwarf birch; and the sixth, which is the highest and most northern of all, varies in breadth according as it is indented by the sea. It is the region of perpetual congelation and eternal snow, producing no trees, and scarcely any vegetation whatever. The vegetable scale in Norwegian Lapland has been marked by Von Buch. The following table is intended for seventy degrees of north latitude:—Limit of the red pines, 730 feet; of the birch, 1483; of the *vaccinium myrtillus*, 1908; of the dwarf birch, 2576; of the *salix myrsinites*, 2908; of the *salix lanata*, 3100; and of perpetual snow, 3300. The species of plants which constitute the *Flora Laponica* are not numerous, but they abound in individuals, and the vegetation here is decidedly superior to that of the other countries round the Frozen Ocean. Mosses and lichens cover the plains and rocks which are elevated more than a thousand feet; and were the inhabitants more industrious, these might be rendered useful as dye-stuffs. The rein-deer's lichen is of a bright yellow colour, which, however, is fugitive, the yellow giving place to white as the plant dries or withers. The mosses and lichens constitute the food of the cattle, and from a species of the latter a wholesome and nutritious flour is extracted. The rocky country is the region of these cryptogamia. The *rubus chamœmorus*, and the *vaccinium myrtillus*, occur in the neighbourhood of the extensive marshes; but reeds or aquatic plants are found on the banks of lakes or rivers. A plain surrounded by rocks, and covered with moss and other alpine herbage, forms a Lapland meadow. Rein-deer moss is quite indispensable to the Laplander's herd. It is hardly to be met with on the Finmark coast, but on the continent it is found in abundance, though not so plentifully as in the interior parts. It thrives best in a flat extent of low ground, consisting of morass or forest well saturated with moisture. On this account Finmark, which is rocky and mountainous, does not abound so greatly in this moss as the level plains and morasses of Russian Lapland, where it grows in the greatest profusion, immense tracts of country being wholly covered with it. Of trees, twenty-six kinds have been enumerated, including the *salices*. There are no less than nineteen species of willows; the others consist of Scotch and spruce fir, birch, alder, poplar, mountain ash, and bird cherry. Apples, pears, plums, and cherries, scarcely grow at all, although carefully cultivated; but considerable varieties of berries are spontaneously produced, amongst which are black currants, and raspberries of an exquisite fragrance. It may be stated, that in Swedish Lapland the vegetable productions bear a nearer resemblance to those of Siberia than the plants of the western part of Lapland, which, towards the sea, are analogous to those of Scotland and Iceland. The most abundant indigenous vegetables are the sorrel, which is prized on account of its antiscorbutic properties; the angelica, a highly-relished article of food; and the *lichen rangiferinus*, the staple of the rein-deer during winter. Towards the south are gardens in which the vegetables of the temperate zone are cultivated; and various flowers, including roses, carnations, and the like, also adorn these enclosures. Potatoes reach the size of poppy-heads (those of Finmark are very sweet, and of a waxy consistency); French beans, broad beans, and tobacco, where care is taken with it, are raised, but neither peas nor white cabbage come to perfection.

With respect to the climate and vegetable productions of Alten, Sir Arthur de Capel Brooke observes, "in speaking of its horticulture, it might be supposed that the produce of a country under the latitude of 70° would be extremely scanty. This, however, is not the case. Most kinds of vegetables succeed perfectly well, and are cultivated in sufficient abundance for the wants of the inhabitants." This traveller then proceeds to mention the cultivation of the potato, which is raised to some extent in Finmark.

Animals.

Most of the wild animals common to Norway and Sweden are found in Lapland. Bears are numerous; and though the rein-deer evades destruction by the rapidity of its flight, yet cows, goats, and sheep frequently fall victims to their rapacity. These animals are extremely partial to a certain kind of berry which is abundant in the country; but they likewise feed on grass. Wolves and foxes are plentiful, and the former are likewise very destructive to the tame animals; the skins of the latter are much prized in the north of Europe. The glutton, which is strongly furnished with teeth, as well as very sharp nails, is common; and its skin, on account of a white shining streak with which the neck is marked, is held in great estimation. In the woods the glutton frequently surprises the rein-deer, by suddenly descending upon it from the branch of a tree, and killing it by mangling the neck with its teeth. Otters of different kinds, ermines, a species of white weasel, squirrels whose skins are beautiful and much valued, the *mus lemmis*, a species of marmot peculiar to the country, and field-mice in vast numbers, are all natives of these high latitudes. The beaver is found in some parts, but seldom on the rivers. The wool and the skin of this animal are marketable commodities. Hares are bred in great numbers; and they are distinguished by the striking peculiarity of changing their colour from gray to white during winter. Coverlets are made from their skins. There are three species of martens found; the *steen-maar*, which inhabits the rocks; the *birfe-maar*, which makes the birch-tree thicket its home; and the *furr-maar*, which haunts the fir-trees. There are said to be a few elks, but of wild rein-deer the number is very great. From these to the individuals of the race which have been domesticated, the transition is natural. The most valuable part of a Laplander's possessions, and the chief object of his care, is the rein-deer. It unites in itself the best qualities of almost every other animal which has been found essential to the comfort of man in other countries to which it is a stranger, being at once the horse, the cow, the sheep, and the stag of Lapland. Its milk is so rich as to require being diluted before it is used. Its flesh is superior to that of the sheep; and, from its tractability and natural power of endurance, it drags the sledge of the Laplander with extraordinary speed and perfect safety over the desolate and chilling regions of snow which he inhabits. It is, moreover, easily maintained, finding its food, the favourite moss which goes by its name, amongst the frozen wastes during winter with perfect ease. These animals are also said to feed on frogs, snakes, and mountain-rats, and to be very partial to human urine, which they lick up with avidity whenever it comes within their reach. But the possession of this invaluable quadruped is very uncertain, for the wandering herds sometimes disperse themselves in the woods, from which it is difficult for the shepherd to dislodge them. They are, besides, not easily milked, and yield but a small quantity at a time, so that a large flock is necessary before the head of a family can be supplied with a sufficiency of food and milk. In shape they resemble stags; and their hair, at first gray, becomes blanched before it falls off. They cast their horns annually; those of the male are often two feet and a half in length, and their points are frequently as far asunder. They are generally four feet in height from the foot to the top of the back; and the length from the shoulder to the tail is two feet. A crackling noise is heard when they walk, which is asserted by some writers to result from the hoofs striking together when the foot is raised, but there are other opinions upon this subject.

---

[1] Much confusion exists regarding the names of places and things in Lapland, and every writer must experience difficulty and be exposed to error in describing any portion or feature of that country or its inhabitants. Mountains, lakes, and rivers have frequently, indeed in almost every instance, more than a single appellation assigned to them; so that what is called by one name in any given work, will be found described under another designation in every other. This is particularly the case with regard to rivers, which, from their source to the sea, sometimes change their names two or three times.

The rein-deer is subject to various diseases from which other animals appear to be exempt, and during summer they are attacked by the *œstrus tarandi*, a large kind of bee, whose eggs, deposited in the skin, produce ulcerations not unfrequently destructive to the fawns. This great enemy of the rein-deer will pursue it for many miles; and in hot weather the Laplander takes a journey of some hundred miles to the sea-coast, principally for the purpose of avoiding its attacks. The *œstrus nasalis*, another tormentor of the rein-deer, makes small punctures within the nostrils, and there deposits its eggs. It is a singular fact, observed by Sir Arthur de Capel Brooke, that the rein-deer increases in size the farther north it is found. Cows, sheep, goats, and horses, have been naturalized in Lapland; but the management of these animals, together with other particulars regarding the rein-deer, we will afterwards have occasion to recur to.

Birds.

Of birds there are many found in Lapland which are unknown in other countries, such as the Lapland woodcock, the Swedish mock-bird or nightingale, called, from its melodious notes, "the bird of an hundred tunes," together with a peculiar species of the owl, magpie, woodpecker, woodcock, and others of the feathered races. Flocks of birds of passage resort to Lapland during summer for the purpose of breeding, amongst which may be enumerated the eagle and falcon tribe, owls larger than common, and occasionally white, crows or rooks in great numbers, ravens, partridges, large bustards, magpies, pigeons, plovers, ptarmigans, swans, wild geese, eider ducks, cocks of the wood, varieties of grouse, curlews, and various other feathered frequenters of the field or lake. Only a very few species of birds remain during winter, there being little subsistence for them in such chilly wastes of snow and ice. Common frogs and lizards are the only amphibious animals found. No venomous animal is to be met with in Lapland, but insects are in hot weather as numerous and annoying as in tropical climes. Besides the two already mentioned, the interior forests of Lapland swarm with gnats, which attack both man and beast with the greatest fury. The rivers abound in excellent salmon, and the lakes in perch, pike, trout, char, and other fish. The seas are also well replenished with the finny tribes, such as cod, tusk, and ling; and whales, particularly that species called the fin whale, so difficult to be captured, abound upon the Lapland coast. These enormous animals are very plentiful about Cape North; and Sir Arthur Capel Brooke was informed by the Laplanders that they are extremely partial to cows and horses, and will pursue a boat in which these are until they are landed.

Climate.

The climate of Lapland is of course very cold, but it is milder than that of any other region on the same parallel, the coasts of Siberia, for instance. The temperature of the air is regulated by the height above the level of the sea, and the distance from the Gulf of Bothnia, and may be divided into two regions, the inland and the maritime. It may be laid down as a principle which generally holds true, that in the former the winter is severe and the summer hot, whilst in the latter the winter is comparatively mild and the summer cold. An open and ever agitated sea is one great cause of the mildness of temperature which is experienced on the northern coasts of Finmark; but the maritime climate is much colder on the other side of Cape North, and the harbours on the coast of Eastern Lapland are sometimes blocked up in the middle of June. In the inland parts the summer is short; but in the sixty-six days during which there is no night, the crops are sown, ripened, and reaped. At this time the enlivening songs of birds are heard, and the earth is in some places covered with flowers. There is no darkness, and the coolness of evening is never felt. The heat is thus very oppressive, particularly in confined places, such as valleys. At this time insects are exceedingly troublesome. Acerbi, a traveller in Sweden and Lapland, found the degree of heat fifty-two of Fahrenheit in the shade, and eighty-one in the sun. The ground was so hot as to give uneasiness to the feet, whilst it oppressed the lungs; and the shrubs which were met with at distant intervals afforded little or no shelter to the traveller. In various parts of Lapland the days during summer are in brightness, geniality, and sereneness, equal to those of more propitious latitudes, and both delightful and healthy. Von Buch found the mean temperature of the month of July nearly sixty-three degrees at Altengaard, in north latitude sixty-nine degrees. In winter the cold is so excessive, that mercury, and even brandy, frequently freeze in the open air. All the lakes and rivers are covered with ice of great thickness, and the whole face of nature is buried beneath a sheet of snow several feet in depth. During the winter solstice the sun continues seven consecutive weeks below the horizon, when only a partial twilight prevails; but this "darkness visible" is to a considerable extent compensated by the superior brightness of the moon and stars, and the vivid beams of the aurora borealis, the light of all these luminaries being augmented by the whiteness of the snow, which keeps up a perpetual reflection from the earth's surface. Thunder storms sometimes occur during the depth of winter. When a thaw comes on, the atmosphere is filled with vapours; but during the prevalence of the north wind the air is clear and the sky is serene.

Vegetation depending more upon the heat of summer than the cold of winter, Enontekis is superior to the North Cape in bringing the productions of the ground to maturity, notwithstanding that the mean temperature is lower, because the heat during the summer is higher at the former than at the latter place. The covering of snow here also, as elsewhere, serves to retain the heat which the earth has imbibed during the warmer months, and preserves it in a better state for vegetation. At Enontekis the snow continues on the ground from October till May, whilst at the North Cape, being open to the sea-breezes, it is exposed to frequent thaws; nor is it likely, under such circumstances, it can ever lie so deep. On some of the inland elevations, particularly in Finmark, if the summer be very cold, it lies during the whole year, and entirely prevents vegetation from making its appearance, with the exception of some of the *cryptogamia*.

Agricl-
ure.

The soil of Lapland is generally sterile. The greater part of the country is covered with rocks or moss, or gravelly plains, or a kind of turf composed of mosses decayed by the frost, and impregnated with standing water. There are a few tracts of tolerable soil, especially in the more southern districts. The agriculture of Lapland is hence very trifling, for the soil yields but a very inadequate return for the labour which the hardy native bestows upon it; and in general he finds a more ready means of supplying himself with what he requires, by barter with the Russians. The following quotation, however, from Sir Arthur de Capel Brooke, presents a more favourable view of the climate and its productions than might have been anticipated. After mentioning the culture of the potato, already alluded to, and which is likely to be very beneficial to the country, as rendering it less dependent upon Russia for a supply of bread corn, he proceeds: "To this it may be added, that barley and rye are cultivated to some extent in parts of Finmark, particularly at Alten, although no agriculture is carried farther north; and this circumstance alone would induce us to form no unfavourable opinion of the climate of a place situated near four degrees beyond the polar circle. The Scotch fir, too, reaches Talvig in seventy degrees; and the *moltebær* (*rubus chamæmorus*) flourishes to the very verge of the North Cape, in 71. 10. 15. where the winter night is ten weeks in length."

rig of
aces.

Much obscurity veils the origin and early history of the inhabitants of Lapland. The Samoyedes, Esquimaux, Greenlanders, and Laplanders, appear to have been originally the same people. The more immediate ancestors of the latter were probably the ancient Finns, for the description which Ptolemy and Tacitus give of the Finni exactly corresponds to that of the highland Laplanders of the present day. We have already stated that the term Lap is only applied to them by Swedes and strangers. In their own language, the country, and Finmark itself, is called *Same Edman*, whilst the people are designated by the word *Samlash*. Thus a Norwegian Laplander, who is called by the Swedes and Norwegians Norsh Lap, would be in their tongue *Dadz Samlash*; a Swedish Laplander (Swensk Lap), *Lade Samlash*; and a Russian Laplander (Russisk Lap), *Ruosh Samlash*. Much confusion takes place regarding this nomadic race, for one day they may receive the name of Laplanders, and the next that of Finns, as they chance to wander either into the territories of Norway, or into those of Sweden. And there is another cause of error, arising from there being a race of people inhabiting Finmark, quite distinct from the Laplanders. These people are called Quäns; they are Finlanders who have naturalized themselves in some parts of Lapland, but at what time they settled in the country has by no means been well ascertained. It is, however, perfectly certain that all over Finland, Nordland, and parts of Swedish and Russian Lapland, they are and have ever been distinguished by the name of Quäns. The native of Finmark is considered as the most genuine specimen of the singular race which is generally designated by the term Laplanders. The circumstances in which he is placed have secured to him for centuries past, and will for centuries to come, a sort of rude independence. Born amongst barren mountains, to which agriculture can never be extended, there is nothing to tempt power to usurp his dominions, or circumscribe his liberty, with the feeling of which he is strongly impressed, as well as with a distaste for the restraints of civilized life. The Finmark Laps have been divided into two classes, the fishing or shore Laplanders, and the rein-deer or highland Laplanders. From their different habits of life, there is a marked distinction between the two; and there is yet another class of poorer Laplanders, who are numerous in all parts of Swedish and Russian Lapland. These are called *Skogslapper*, or wood Laps, dwelling almost entirely in the wooded parts of the country, their herds of deer being too small to enable them to live in the mountains, and trust to them alone for subsistence. They live in tents during summer; but when winter sets in they construct a more durable habitation, composed of sods, somewhat resembling the *gammies* or huts of the coast Laps. In the latter season they are stationary, and subsist partly on their rein-deer, but more on game and wild animals, which are abundant, and the constant pursuit of which renders them very expert at the rifle.

This kind of Laplander is unknown in Finmark, the country being mountainous, and nearly destitute of forests. The mountain Laps of the latter country are for the most part wild and savage, both in appearance and habits. They exhibit a degree of haughtiness and proud independence of spirit, which is wanting in individuals of the race who inhabit the plains of Russian Lapland or the shores of the northern coast. Until softened by a present, they are surly and morose in disposition; and their suspiciousness of temper detracts much from any hospitality which is apparent in them. The stranger must therefore remove this natural mistrust of the Lap before he can expect to receive from him any attention; and brandy, above all things, is the most potent softener of his feelings. This, or a present of tobacco, is so efficacious as to render him quite a different person, and willing to perform any service to the donor.

Dress,
manners,
character,
&c. of the
people.

The dress of the mountain Laplander of Finmark does not materially differ from that of the inhabitants of other parts of Lapland. In winter they are entirely clothed in rein-deer skins, consisting of a *pæsk*, or frock of rein-deer fur, or, what is more common, a *muadda* or sheep-skin garment. This is belted up by the leathern girdle (*buagan*), to which is suspended the knife, the tobacco pouch, and shooting apparatus when they follow the chase. The first is a long knife, not unlike that of a butcher, the handle of birch root, and the blade of great substance and strength.

The driving pæsk is composed of the thickest and best skins his deer afford; and, as a further protection whilst travelling, a broad bear-skin tippet covers the shoulders, and reaches nearly as low as the elbows. The lower part of the dress consists of the *bællinger*, a sort of loose spatterdashes or leggins, which, being drawn over a pair of long, loose deer-skin pantaloons, reach from the ancles high up the thigh. These are whole, and fastened or tightened at the top by a running string, and covered over at the bottom by the *skallkomager*, or high rein-deer shoes, and the *komager baand*, which is a long, narrow band, going several times round the ancle, keeping the whole tight together, and preventing the possibility of any snow from getting in; for the upper parts of the *bællinger* are of course covered by the pæsk, which, when girded up, reaches just below the knees, but, when loose, falls down nearly to the ground. In summer, the heat of the weather compels them to make an alteration in their dress, and the rein-deer pæsk is exchanged for a round frock of wadmal cloth. This *gappe* or summer frock, which is generally made of the skins of young deer, extends below the knees. On the head is worn a small low cloth cap (*gappir*), turned up all round, with a facing of fine rein-deer fur. No shirt is worn next the skin, linen being a luxury with which the Laplanders are entirely unacquainted. The use of stockings is likewise unknown, but a substitute is found in the soft dried grass called *sena*, with which the shoes are well stuffed. The hands are protected by rein-deer gloves, or rather mittens, being without fingers, but stuffed with the same kind of grass as the shoes. Almost every part of the winter dress of the Laplander is thus furnished by the useful animal which is the companion of his wanderings. The pæsk is made from the whole hide of the deer killed during winter; the bællinger and gloves, of the skin covering the legs and thighs of the animal; and the shoes are taken from the skin between the horns, and covering the crown of the head. The fur is worn on the outside, and, from the peculiar closeness and thickness of its texture, it is impossible for the cold to penetrate it. Every part of a Laplander's dress is worn loose, and thus the blood is allowed to circulate freely, an advantage which could not be enjoyed were the clothes tight on the skin. The dress of the coast Laplander is entirely similar to that of the mountaineer, except that when the weather is not warm, he usually wears a sheep-skin garment called *muadda;* and the wool being next the skin, it is rendered nearly as warm as the rein-pæsk, though this also he commonly wears in winter. The former, however, being the produce of his own flock, and made up by himself, is naturally in more general use. The rein-deer skins are obtained by barter from the highland Laplanders, and being made into garments by the inhabitants of the coast, who are expert at this kind of work, are again sold or exchanged for silver money, or the necessaries they may require. The women have some skill in embroidery, and collars and cuffs of the wadmal dresses, both male and female, exhibit their taste in the art of adorning. The dress of the females very much resembles that of the men. In winter a frock or pæsk of sheep-skin, worn with the woolly part inside, is bound to the waist by a belt, to which a small knife is suspended. In summer the sheep-skin frock is exchanged for one of wadmal cloth. The cap is sometimes made of various kinds of cloth, and it is usually encircled by a ribbon. The fondness of these people for anything gaudy is very conspicuous in their summer dress, for the necessities of winter compel them to keep it more unvaried. During the hot months the Lapland costume is very picturesque, from the variety of colours combined in it. It is then, particularly on the sabbath-day and on holidays, that he shows his pride, by making his appearance in all the finery that his means will afford. The usual colour of his *koften* or daily frock is white, with several edgings of blue and red cloth round the bottom and cuffs, but his Sunday garment is of a more ornamental nature, and frequently of thin cloth, richly embroidered in party colours round the cuffs and collars. In some parts of Lapland koftens of black cloth are met with, and those that are wealthy sometimes array themselves in scarlet ones. On extraordinary occasions, other parts of their dress are also of a finer nature than what is commonly worn. As may be supposed, even the best species of cloth which finds its way to these regions, is of a very inferior quality; it is chiefly of German manufacture, although cotton from England is also found here. Those of the women who can afford it, adorn their persons with rings, and ribbons of the gayest colours flutter around their bonnets. Like the Greenlanders, and other inhabitants of high latitudes, females wear pantaloons like the men, a practice which was in all probability had recourse to for personal comfort, in regions where open garments would have unnecessarily exposed the body to the cold. It may be mentioned, that the dresses of the families of the merchants who live on the coast are very superior, in point of elegance, to the garments of the native Laplanders.

The difference of character between the highland and coast Laplander has already been adverted to. The former is known by his haughty expression of countenance, and proud independence of demeanour. The more domestic habits of life of the coast Laplander, render him a more quiet and inoffensive being, and give to his features a milder and a somewhat vacant expression. Speaking of the Laplanders in general, they must be considered as a diminutive race, though not such pigmies as is commonly supposed. The Norwegian Laplander is superior in stature to the rest of the race, and this difference is probably to be attributed to the freer and purer air of his mountains rendering him more hardy and robust. The average height of the highland Laplander may be considered as varying from five feet to five feet two inches. They sometimes, but very rarely, exceed this stature. The characteristic features of the race are small elongated eyes, high cheek-bones, wide mouth, and a pointed chin, with little or no beard. Their hair is generally brown, or dark coloured. Their bodies, from their habits, are naturally spare, and devoid of corpulence, though in general they are ill made. They are bony and muscular, possessing greater strength than their stature would seem to indicate, active, and capable of enduring almost any fatigue. Their hands and feet are remarkably small; their voice is weak, and its tones have a squeaking effect upon the ear of a foreigner. In their moral character the Laplanders exhibit some marked peculiarities. Their passions partake of the torpor of the climate, and flow in a slow, cool, and regular course, unbroken by those sudden ebullitions and transports which characterize the men of warmer latitudes. Love, or the amatory feeling, is but a lingering spark, only sufficient to answer the purposes of nature. They possess in a remarkable degree the virtue of continency, and the conjugal relation is rarely or never violated, although both their parental and filial affections are weak. Anger and bloodthirstiness are unknown to them; and Sir A. Capel Brooke found, in 1823, that, during the space of twenty years, only one murder had been committed in Finmark. Although they are generally cautious, mistrustful, and suspicious, especially of strangers, as well as cunning in their commercial dealings, yet theft is almost unknown amongst them. The absence of this vice is proved by the fact, that locks, bolts, and other safe-guards, are considered as unnecessary appendages to a door. They have been accused of avarice, but without any just reason; for whatever strictness they may observe in bargain-making does not arise from a wish to hoard up money, but that they may be more bountifully supplied with their favourite beverage, brandy, of which they are excessively fond. Drunkenness is not only common, but may be said to constitute a feature of their character. In temper the coast Laplander is of a kinder nature than the mountaineer, and he is more inclined to hospitality, although this virtue is by no means very conspicuous in either. They are generally passive, without much courage, and altogether of a very peaceable and inoffensive disposition. They now exhibit little of a warlike spirit, although in former ages they were frequently the cause of terror to the Norwegians. Notwithstanding their ebriety, health is a blessing which the inhabitant of Lapland enjoys in a high degree. They were formerly addicted to degrading superstitions; and the witchcraft in particular which was exercised amongst them has passed into a proverb. Milton alludes to this circumstance when he speaks of dancing "with Lapland witches." They were famous for their empire over the winds, which they disposed of in bags to the credulous mariners. In performing their infernal rites, the instrument used was the magical drum, by beating which as an accompaniment to other ceremonies, they fancied they had the power of foretelling future events, curing diseases, and exorcising evil spirits. Their mythology was distinguished by an universal idolatry, in which the elements were typified, and a polytheism, by which every object in nature was changed into a god. But on these wild creations of the human mind in a state of ignorance and barbarism it is unnecessary to dwell. The rites by which the worship of their deities and idols were celebrated are now unknown, being supplanted by those which have their origin in the milder and purer genius of Christianity.

Habitations.

The habitations of the Laplanders now demand description. The mountaineers live in tents, which differ in no respect in summer and winter, and are of very simple construction. They are formed by six beams of wood rising in a pyramidal form, and meeting nearly at the top, covered with thick and coarse cloth, a flap of which, left loose between two of the beams, constitutes the door. The height of the tent is generally about six feet, and the whole circumference of the inside seldom exceeds fifteen or eighteen feet. The floor is strewed with rein-deer skins, having the hair upwards, and which thus serve for either lying or sitting on, the tent being too low to permit of the occupants assuming the erect posture, except in one place. A stone frame is made in the middle for the fire, and there is a hole at the top to which the smoke must find its way; but its speedy egress is by no means considered as necessary to comfort. The fumes thickly impregnate the whole tent, as well as "all which it inhabit;" a species of japanning highly valued, as affording a protection in winter against the cold, and in summer against the swarms of musquitoes. Cabined and confined in this limited domicil, it is here that the Laplanders, seated on their heels in the manner of the eastern nations, or squat like toads, spend in all the beatitude of idleness the moments which they can spare from their pastoral avocations. The different provisions are kept in boxes attached to the stakes; and boxes are ranged on the inside round the cloth or covering; but these precautions are often unavailing against the impetuosity of the blast, whilst the thinness of the tent naturally exposes the inmates to the severity of the weather. In regard to habitation, the shore Laplanders have a decided superiority over those of the mountains. The gammie or hut of the former is usually about five feet in height. It is generally of a circular or oblong form, having the appearance of a large rounded hillock, which name it may be said to deserve, being composed of turf laid on branches of the birch, and supported underneath by a wooden frame-work of stronger materials, to bear the weight of the whole. The entrance is by a low, narrow passage, at the extremity of which is the door communicating with the part inhabited. Around them are generally enclosures for the cattle, and several racks of coarse fodder for their winter food. The farming stock of the coast Laplander consists of a few sheep, and sometimes a cow or two, which are kept in the enclosure during the summer season, and in winter occupy the same buildings with their owner, being supported during the latter partly by the coarse fodder which he has been able to collect, but chiefly by the remnant of his fishing produce.

Habits and modes of life.

Necessity has rendered the highland Laplander a wanderer, and habit has made that mode of life a second nature to him. It is upon the rein-deer that he almost entirely, if not altogether, depends for subsistence; and hence their welfare is the chief object of his care, in promoting which he is compelled annually to take long journeys to the sea-shore for the purpose of avoiding the attacks of insects. His habits of life are thus in a great measure formed; and the year is divided between his abode on the mountains and his migrations to the coast, whilst his life as a whole consists of the extremes of bodily fatigue and total inaction, plenty and want. When he is hungry, and has the power of gratifying his appetite without restraint, he is perfectly ravenous, and devours a quantity sufficient to support him for several days. Those who inhabit high latitudes, where subsistence is precarious at certain seasons, seem all to have a remarkable capacity of stomach, and to be capable of eating an enormous quantity at a meal, so as to serve them for five or six days, without being annoyed by the load. The necessities of their situation have compelled them to practise this frequently, and custom has rendered it easy. The Laplander's household economy, it may readily be imagined, is simple in the extreme. His food during the period of his summer rambles is spare and frugal, and without any indulgence in rein-deer venison, his favourite food and the luxury of the winter season. In summer he is intent only on increasing the number of his flock, and on providing against his future wants. He contents himself then generally with milk, and the remains of the curd and whey after making his cheese. The first is taken sparingly, on account of the small quantity which a single deer yields, as well as of the great importance it is to him to secure a good quantity of cheese for his winter stock, and to guard against any disaster that might befal his herd and reduce him to want. As he milks his herd during the summer season only, when this approaches a close, some milk is generally preserved for the purpose of being frozen. This serves not only for his own individual use during the winter, but, being highly prized for its exquisite delicacy in this state, it constitutes an article of trade; and the merchants with whom the Laplander deals, and who then repair to the interior, gladly purchase it at any price. Though the rein-deer milk is thus of a very rich quality, yet the cheese made from it is extremely bad, and unpalateable to any one but a native. It is made by simply placing the milk in a large iron pot over the fire, which, with the addition of rennet made from the stomach of the deer, quickly coagulates. The curd is then pressed, and the whey, being separated from it, is put into shallow moulds of about the size of a small plate. Bad as it is, the hardy Laplander is very partial to it both raw and roasted; in the latter state it appears at the tables of the merchants, and is rather more eatable than when unprepared. When heated, an oily juice exudes from it, which is found of great use in removing the effects arising from being frost-bitten. Butter is seldom if ever made of rein-deer milk by the Laplanders, but it is so by the Finland settlers, who in many parts of Lapland keep herds of rein-deer, the colour of which, it is said, is peculiarly white. The Laplanders sometimes vary their dishes by mixing different kinds of wild berries with the whey, the latter being previously boiled till it acquires some degree of consistency. They are no less fond of the roots of the angelica, which has an agreeable taste, and likewise possesses antiscorbutic properties. Much value is set upon the blood of the rein-deer, from which a variety of dishes is prepared, care being always taken to preserve it when the animal is killed. It is also supposed to possess antiscorbutic properties. Those who reside upon the coast subsist chiefly on fish, with a little beef and mutton occasionally. The furniture consists of horn spoons, pots and kettles made of brass or copper, and sometimes of stone, wooden bowls capable of holding about twelve quarts, a basket for holding cheese, and a barrel for oil and other liquids. Some of the richer natives possess the more showy utensils, such as pewter plates, and spoons of silver. The highland Laplanders obtain all the artificial light which they require from the fire alone, but those on the coast use a rude sort of lamp. One or two shelves for cheese run along the upper part of the house; and a few rennet bags, containing the milk for winter use, are suspended from the roof. Oval fir boxes, answering for panniers, are employed in transporting their goods; two of them, weighing about two pounds each, are carried by one rein-deer. The most ornamental article of furniture is the cradle, which is a piece of wood hollowed out, and having a recess for receiving the head of the child, and being provided with cords, by which it is fastened to the mother's back when she travels. In shape it somewhat resembles the sledge, with the lower part open, and the upper protected by an arched covering made of leather, which shelters the head of the infant. It is stuffed with soft moss, is portable and safe, and, when slung on the back, the head of the child appears above the shoulders of the mother, whose hands are left at liberty, and who is otherwise little incommoded by her burden in travelling.

Herds.

The herds of the Laplanders vary much in size, and this circumstance constitutes their riches or poverty. He who has 1000 rein-deer is accounted rich, though instances are by no means rare of one individual possessing 1500 or 2000 animals of this description. With three hundred a family may live in tolerable comfort, but with one hundred subsistence is precarious, and fifty reduces a Laplander to the state of a menial. He is no longer independent and able to keep a separate establishment, but generally joins his herd to that of a richer proprietor, whom he serves in the capacity of a servant, milking and tending the herd. Sometimes when thus reduced he migrates to the sea-coast, where he supports himself by fishing or otherwise. If successful in his efforts, he returns, purchases a herd, and resumes his pastoral habits. It more generally happens, however, that having once become a coast Laplander, he remains so to the last, being naturally too thoughtless and improvident to carry his views beyond the exigencies of the moment. Should the herd of the mountain Laplander be at all numerous, it rarely happens that the possessor is aware of the exact number, there being a superstition prevalent amongst them, that counting the flock, like numbering the heads of the Israelites, will be attended with evil. During the day they are allowed to wander over the hills where they please, but watched by a shepherd, who observes their motions, and is assisted in his duties by several dogs. These are in readiness not only to guard against any attack of wolves, but also to prevent the herd from being too widely dispersed, and to assist in bringing them to the fold in the evening to be milked. After they are brought into this enclosure, and secured by a cord attached to the horns, and held either in the hands, or fastened to some shrub, the women bring their bowls from the tent, and proceed in the operation in the usual way. Many of the deer are very refractory whilst this is going on, and, butting with their horns, not unfrequently overthrow the female in attendance. The Laplander justly sets a very high value upon his dogs, the services of which are invaluable. The breed is remarkable for the smallness of its size, resembling the arctic fox in every thing but colour.

Employments.

The employment of the highland Laplander may be said to be entirely confined to the care of his deer; and when not actively engaged in tending them, he most frequently stretches himself in his tent in a state of listless ease, or amuses himself by fashioning a rein-deer's horn into a spoon. But this monotony is occasionally broken by a hunting excursion, in which he pursues the bear and other animals. Ptarmigans, foxes, gluttons, martens, and other animals, he either shoots, or catches by means of traps and snares. He has several kinds of sledges, both for the conveyance of himself and of his effects. The pulk, which is intended for the use of merchants and other travellers, in form resembles a boat, and is about seven feet in length by sixteen inches in breadth, and generally about eight inches in depth, the back board or stern part being about sixteen. The head of the pulk comes to a point like a canoe; the stern is flat, and the bottom or keel convex. Above it has an oval half deck in front, covered with seal-skins. This is the close pulk; the open sledge wants the deck, but its general dimensions are similar to the other, and it is made, like it, of birch wood, although of ruder construction, and finished with less care. For the conveyance of goods, there is another open sledge of much larger dimensions, being about eight or nine feet in length, and of proportionate breadth. One deer is sufficient for a sledge, to which it is attached by a very simple harness, consisting of a collar of rein-deer fur for the neck, a trace which passes between the legs of the deer, and through a broad belly-band of cloth fastened round the body of the deer. There is of course a bridle and rein, and round the neck is a loose band of cloth, to which a bell is suspended, the sound serving to keep the party together. Although the difficulty of preserving the equilibrium of the pulk is at first very great, yet, so expert is the Laplander in guiding it, that the chief accidents that happen to him in his winter expeditions arise either from losing his way, or being caught by snow-storms or snow-drifts. Without these convenient vehicles it would be impossible to traverse a country so rugged and broken as Lapland, and even with this advantage as to locomotion, the difficulty is very great. The speed with which the animal travels is remarkable, ten miles an hour being easily accomplished at a trot, and probably double that space at a gallop. In the interior parts of Lapland travelling is suspended during summer, roads being unknown here; and it is only in winter that, by the aid of this invaluable animal, the country can be traversed. In some parts of Lapland, rein-deer have been made available for agricultural purposes, such as ploughing and harrowing; but this only happens when the proprietor is very poor. They are likewise employed during the winter season in drawing hay and fodder loaded upon trays. The Laplanders, especially those of Finmark, have a mode of travelling by means of the *skie* or snow-skait. It is made of wood, is very narrow, but frequently more than seven feet in length. In many parts of Lapland the greatest use made of them is in pursuit of wild rein-deer, and the other animals with which the country abounds. With these he makes rapid progress, and undertakes very long journeys without any other means of locomotion.

Migrations.

Various reasons induce the mountaineer to repair to the coast during the summer season. First, that his herd of deer may escape the gad-fly, with which, in June, July, and August, the rein-deer are much tormented; and secondly, to sell or barter the disposable commodities which he has collected during winter. These consist of the skins and horns of the deer which he has killed for the support of his family during winter; and the skins of other animals which he has succeeded in capturing, such as the bear, fox, glutton, and marten, and the feathers of the ptarmigans which he has shot or ensnared. All these are valuable articles of commerce to him; and, by bartering them with the merchants of the coast, he is enabled to procure others that are necessary to his comfort in winter, such as coarse cloth, meal, gunpowder, and tobacco. It is also a matter of belief with the Laplander that it is absolutely necessary to the existence of his rein-deer, that they should once during the summer drink salt water; and this forms another and a very strong inducement for him to visit the coast. The deer eagerly drink salt water, and the draught is said to be efficacious in destroying the larvæ of the gad-fly, which lays its eggs in the hide of the animal previously to quitting the forest. The annual migration of the Laplander commences in June, by which time the snow is generally off the ground, and consequently his mode of travelling is no longer in sledges. These, with all his winter necessaries, are left behind him in his summer expedition, and he commonly deposits them in the storehouse which almost every highland Laplander possesses, near his church, in the neighbourhood of which he generally remains during the winter. The distance which he has to travel varies according to the situation of the coast to which he is bound, but sometimes exceeds three hundred miles. Sir Arthur de Capel Brooke, speaking of migrations, observes, "the Swedish Laplanders that repair to the coasts of Tromsöe and Senjen belong chiefly to Tornea Lapmark, inhabiting the shores of the Tornea Träsk. These parts are also the resort of those from Enontekis, in Russian Lapland. The Laplanders from the other Lapmarks make for other parts of the Norwegian coasts which are nearest to them; and, though the distance may be less, they do not, I believe, ever bend their steps toward the Gulf of Bothnia, preferring the coasts of Norway, from the absence of wood, the freshness of the breezes, and the freedom from the insects which swarm in the forests that skirt the shores of the gulf, as well as in their own."

In studying the health and safety of their herd, they generally make choice of the numerous islands on the western coasts of Norway and Lapland, from their superior coolness, as well as from the absence of bears and wolves. These also present a great advantage in being very convenient stations for fishing, and possessing good harbours; whilst fish likewise resort in great numbers to the numerous fiords or bays, and narrow channels between them. This is the reason why on the whole of the northern line of coast the mainland is nearly uninhabited, with the exception of the borders of the fiords, though the only supply of wood is to be found there; whilst almost all the rocky isles so profusely scattered along the coast possess inhabitants, although generally barren in the extreme. After the mountain Laplander has reached his fishing station, he erects his tent of coarse wadmal cloth, and proceeds to barter his skins, furs, and other articles of commerce, for necessaries which he requires, but principally for brandy, which he drinks to excess. Indeed it sometimes happens, that when he is about to return to his winter quarters, he is occasionally obliged, though reluctantly, to part with his deer, in order to supply himself with what is absolutely necessary to his existence. The mountain Laplander makes it a point to be paid in silver in all his dealings with the merchants; and he frequently amasses a considerable quantity of dollars, which he usually buries in the ground in some spot near his tent. In September, he breaks up his summer quarters, and gradually retires into the interior parts of the country. The circumstances which oblige him to return is the want of rein-deer moss on the islands, and also of fuel, both of which are readily procured in the interior parts of the country. The want of the latter is said to have led to the gradual and almost entire depopulation of the Finmark coasts. His stock of necessaries and household utensils are packed in a kind of wicker pannier, one of which hangs on each side of the deer, and, by slow and easy stages of six or seven miles a day, he reaches that part of the continent where he intends to fix his winter abode. Venison constitutes the principal article of food of the highland Laplander in winter, the only season when he kills his deer for supporting himself and his family.

Fishery, &c.

The coast Laplanders support themselves entirely by the fishery, which is astonishingly productive, 2000 lbs. weight of cod-fish being caught in a day by means of lines alone. From the great number of small Russian vessels which frequent the coast at certain seasons, they find a ready sale for the fruits of their industry, receiving in exchange chiefly meal, brandy, tobacco, and the like. Whales are abundant, particularly what is called the fin whale, which is long, active, swimming with great strength and speed, and consequently difficult to capture. It is usually killed by darting the harpoon into the body, and then breaking it close off. No more notice is taken of it at the time, but the wound generally proves mortal, and in a few days the animal is found cast upon some part of the neighbouring shore. The value of a good whale of this kind is about L.150, or 1000 specie dollars. The owner is known by a mark on the barb of his harpoon, by which he identifies his property; but law entitles the finder to one third of the booty. Great quantities of other kinds of fish, particularly the sey or coal-fish, are likewise caught. The latter are taken by means of nets, and this fishery constitutes one of the most lucrative branches of the Finmark trade, as does the down of the eider-duck. Plaice of a huge size, halibut, and echini of all hues and sizes, are likewise amongst the fish taken; but of shell-fish there are few or none, the northern shores, from their nature, being particularly barren of testacea. Halibut of 500 lbs. weight is frequently taken, and it is esteemed a great delicacy. The farming stock of the coast Laplander consists of a few sheep and goats, and sometimes a cow or two; but pigs are little known in Finmark, and do not constitute part of his property, sheep being of superior utility in furnishing him both with food and raiment; and his wants are, besides, very limited. On the approach of winter the whole of the cattle are brought from the mountains, where they are sent to graze during summer, and are shut up in stables. The weight of the cattle is not considerable. During winter, as a substitute for fodder, they are almost entirely fed upon fish, to which they are very partial. Some of the shore Laplanders keep rein-deer, but these animals very rarely constitute part of their property.

Arts, manufactures, amusements, &c.

In their manual arts and manufactures, that is, making the various utensils which their mode of life requires, the Laps display some ingenuity. Their sledges and canoes are very strongly and closely put together, so as to be entirely impervious to water. They tan hides with the first inner bark of the birch, make strong cordage and thread of the sinews of the rein-deer, weave coverings for their tents, knit gloves, fashion wooden utensils for domestic purposes; and the women prepare the skins of foxes, fawns, otters, and other animals for sale, by stripping off the membraneous parts, and curing them with fish-oil. The Laplanders have a few amusements, but the chief is hunting, which, however, rather constitutes a part of their professional avocations, than of their choice pastimes. The bow and arrow, which formerly constituted their offensive weapons, are now supplanted by fire-arms, particularly rifles, in the use of which they are very expert. A taste for music and poetry have been attributed to the Laplanders; but this, Sir Arthur de Capel Brooke observes, is a mistake, arising from travellers mistaking Finns for Laplanders, a circumstance which very frequently takes place. Amongst the amusements of the Laplanders may be mentioned their occasionally assembling at feasts, where the favourite beverage, brandy, freely circulates, and mirth and noisy loquacity prevail. At marriage-feasts hundreds meet, and the ceremony is conducted with great formality and decorum; but the more solemn ritual of a funeral is characterized by an appropriate want of any thing like parade or show.

General description.

In order to present a view of those parts of the Lapland continent, as well as of the numerous islands with which the shores are crowded, we shall follow the route of a recent traveller.[1] Loppen, the first island in Finland, coming from the south, is about ten miles in circumference, but very narrow. It contains five or six families, and has a church and a resident clergyman. Scattered patches of the soil are good, and might produce corn if cultivated; but this is no motive for doing so, as it is more cheaply and easily obtained from the Russians in exchange for fish. At a few miles' distance from Loppen is Soroe, the largest island in Finmark, and inferior in size to few in Norway. Its dimensions have not been definitely stated, but it is supposed considerably to exceed one hundred miles in circumference. It is thinly peopled by a few Norwegians and shore Laplanders; and the whole of the western coast is uninhabited, on account of its great exposure to the fury of the northern storms. It merely consists, like the rest of the island, of high precipitous rocks and mountains, enclosing deep valleys, which in summer are not without considerable luxuriance of vegetation, being penetrated by numerous fiords or arms of the sea, which run a considerable way inland. The principal place here is called Havsig; and it has a church, where the clergyman of Loppen ministers, the two parishes being under his care. They contain between them only about two hundred inhabitants. Seyland is a pretty large island, but very mountainous. Qualöen, or Whale Island, where Hammerfest, a town founded by government, is situated, presents a miserably naked and barren appearance, hardly a shrub being seen, and only rocks piled upon each other in wild magnificence. The town consists of a few scattered houses belonging to the merchants, which are built of wood, and painted all over with a kind of red ochre. Behind them is a church, and near it the residence of the clergyman. Close to these, and overlooking the sea, there is a small battery. The Hammerfesters are extremely lively, and fond of dancing, singing, and merriment. Balls are very frequent, at which the ladies appear in very gay, even elegant dresses, of English manufacture. Since 1808, when this place was visited by Von Buch, its trade and population has improved so considerably as to afford sanguine hopes of the future. In the year 1810, the population was only seventy-five, and in twelve years it had increased to considerably more than two hundred. Their commerce consists, first, with the foreigners, who supply the merchants with their own manufactures, and different kinds of colonial produce, and receive payment in the native staples, fish and oil; and, secondly, in the local or home trade between the dealer and the natives, who barter the fruits of their industry for meal, cloth, brandy, and other articles. The whole of the commerce of Hammerfest, however, is inconsiderable, compared with that carried on by the Russians, which constitutes the most important feature of the trade of Finmark; and, though still in its infancy, is of such importance as to deserve being mentioned. The Russians who visit Finmark come chiefly from Kola, the Gulf of Kandalax, and the borders of the White Sea. They belong to the poorest class, and conduct their trade solely in small three-masted vessels of from thirty to one hundred tons burden. Several hundreds of these make their appearance about July, and anchor in the vicinity of the fishing banks, to be in the way of the mountain Laplanders when they return to the coast, with whom a traffic is carried on chiefly on the principle of barter. The Russian delivers his cargo of meal, hemp, flax, copper, tar, sailcloth, lines, and other articles, and receives in exchange any foreign produce he may require, but, generally, the various kinds of fish which are bought by the vog, which is about forty pounds English. The importance of this trade, both to Russia and Finmark, may be estimated from a statement made regarding this particular branch of commerce, that no less than 100,000 vogs of fish were annually taken from Finmark by the Russians. A considerable trade is also carried on in fox-skins, which fetch from two to four specie dollars. The bay of Hammerfest is well sheltered, and the harbour, though small, is very secure, and frequently contains a number of vessels from different countries, England included.

Passing over a few desolate and unimportant islands, such as the Stappen Isles, well known to English mariners under the name of Mother and Daughters, we come to that of Mageroe or Lean Island, where North Cape is situated. This name is sometimes applied to the whole island, but properly only belongs to its northern extremity. This island is about seventy miles in circumference, and is very narrow, being intersected by long and extensive *fiords*, which cut deep into the land on both sides, and nearly meet. On the mountains about two hundred deer may exist, the property of Laplanders, whom the breadth and turbulent nature of Mageroe Sound confine permanently to the island. On some parts of it there is brushwood, but its characteristics are sterility and desolation. The North Cape is a long extended headland or tongue of rock, narrowest near its root, and enlarging itself towards its other extremity, where it takes a circular form, and is indented by several chasms that form small creeks. Its surface is flat, and destitute of vegetation, but thickly strewed with fragments of rock, particularly quartz. Foxes are here abundant, and at certain seasons of the year sea-fowl frequent the island in vast numbers.

On the continent, the place which first demands attention is Alten, or Altengaard, a name applied also to a district the most populous and fertile in Finmark. The forests are the most extensive in the country, though now considerably diminished. The principal inhabitants are the Quäns, who occupy an entire village in the immediate neighbourhood of Alten. The situation of the latter is very advantageous in respect to the interior trade of Finmark, as it forms the principal means of communication, not only with the inland parts, but also with Sweden; and all kinds of merchandise being brought by sea to Alten, are forwarded to the various other parts of Lapland by rein-deer. During winter it is the scene of considerable life and bustle, from the continual arrival of strangers; and in February a fair is held, attended both by the merchants and by the coast and mountain Laplanders. It is situated in north latitude 70°, and is considered the coldest place in Finmark, yet here vegetation is by no means so contemptible, as we have already shown. The salmon fishery was once very considerable, and constituted one of the chief articles of export, but it has now much declined. About one hundred and fifty miles south from Alten is Koutokeino, which is also the name of a district of considerable size, but mountainous and barren. At this place there is a resident clergyman, who has a parsonage-house, which, like the abodes of other Lapland ministers, is a mere log-hut, consisting of one story, and comprising a small room and a back kitchen. The whole place, indeed, consists merely of a few log-huts, situated on the banks of the river Alten. Kangis, in Swedish Lapland, is celebrated for its fair, which is the great point of union for the whole of the Northern Laps. It lasts five days, but its importance has greatly diminished, on account of the reduced value of the mines. On the Muonio or Muonioniska River, is a town of the same name, the houses of which are much superior to those farther north. Here the population consists principally of Finns, the number of which tribe increases as the traveller proceeds towards the Gulf of Bothnia.

---

[1] "A Winter in Lapland and Sweden, with various Observations relating to Finmark and its Inhabitants, made during a Residence at Hammerfest, near the North Cape, by Sir Arthur de Capel Brooke, Bart."

Population. The whole population of Finland is supposed not to exceed 60,000. The degrading superstition in which they were formerly sunk has now in a great measure disappeared, along with those numerous deities which they worshipped: the wild creations of unenlightened nature have been superseded by Christianity, and a knowledge of the true God. Regular clergymen are established in the country by the different governments, and the Laps exhibit much reverence and devotional feeling during divine service, although its purport is only known to them through an interpreter. Finmark, in regard to ecclesiastical regulations, is under the jurisdiction of the Bishop of Nordland and Finmark, both of which form one diocese. As may be supposed, the revenues of the crown are not materially benefited by the contributions of the poor Laplander. Every one, however, whether his abode be on the shore or on the mountains, pays a yearly tribute of four-and-twenty shillings, which may be considered merely as an acknowledgment of their being subjects of the power by which it is collected. A Laplander that is taxable has likewise to make an annual offering of a rein-deer ham and tongue to the *sorenskiver* or judge; and to the priest half a rein-deer with the exception of the breast part, a pair of rein-deer gloves, nine pounds of tallow, and a rein-deer cheese, which donation is called a *ritterbil.* This applies only to the Laplanders who derive their subsistence from their herds of deer; the shore Laplander pays his dues in fish. To collect the taxes for the crown, the *fogeds* or sheriffs, and *lendsmen* or sheriffs' officers, appoint general meetings of the Laplanders, at stated times of the year, when they receive their payments.

Language. The language of the Laplanders is a Finnish dialect, with so great an infusion of foreign words, that the inhabitants of the two nations require an interpreter before they can understand each other's meaning. "The numerous cases," says Malte-Brun, "the varied terminations of nouns and compound verbs, the method of expressing pronouns by *affixa* joined to verbs, and, lastly, the negative conjugations, are characteristics equally applicable to the languages of Finland, Esthonia, and Lapland. The last is in some respects still poorer than the other two; thus there are five words for snow, seven or eight for a mountain; but honesty, virtue, and conscience, must be expressed by a periphrasis. The Lapponic has been mixed, perhaps, still more than the other Finnic tongues, with the German and Scandinavian, which were spoken by the conquerors, who were too often the tyrants, of the Finnic race." Some old Hungarian roots are also found in it, from which circumstance, as well as from others, it has been inferred that the Laplanders are the descendants of a Hunnic mixed with a Finnic people, or perhaps a distinct branch of the great Finno-Hunnic race. The principal roots and derivatives in the Lapponic tongue certainly bear less affinity with those of the languages of Upper Asia, than any other Finnic dialect. (R. R. R.)

LAPSE, in ecclesiastical law, a slip or omission of a patron to present a clerk to a benefice within six months after it becomes void, in which case the benefice is said to be in *lapse*, or *lapsed*, and the right of presentation devolves on the ordinary.

LAQUEARIUS, a kind of athlete amongst the ancients, who in one hand held a *laqueus*, or sort of snare, wherewith to embarrass and entangle his antagonist, and in the other a poniard to stab him.

LAR, the capital of the province of Laristan, in Persia, once a magnificent city, but now in ruins. It is situated at the foot of a range of hills in an extensive plain, which is covered with palm trees. The houses are commodious and neatly furnished, each having a *badgeer* and *surdab;* the former to cool the inner apartments, and the latter to retire to in the summer season, in order to avoid the intolerable heat of the climate. The residence of the khan, or governor, is in the middle of the city, and is surrounded by a strong wall flanked with towers. The celebrated castle of Lar, now in ruins, is situated on the summit of a hill, immediately behind the town, and is said by the Persians to have been impregnable. The city is decorated with many handsome buildings; and the bazaar, which is in good repair, is said to be the noblest structure of the kind in Persia. It is very ancient, and is built in the same manner as that of Shiraz, but on a much grander scale, the arches being lofty, the breadth and length greater, and the workmanship in every way superior. It still contains 12,000 inhabitants, and is celebrated for the manufacture of muskets and of cotton cloth. Long. 52. 45. E. Lat. 27. 30. N. (Kinneir's *Geographical Memoir of the Persian Empire.*)

LARACHE, or EL ARACHE, a seaport town of the kingdom of Morocco, in Northern Africa, is situated at the mouth of the Luccos, a river which anciently bore the name of Lixus. This town, which formerly belonged to the Spaniards, has some neat buildings; and, though not regularly fortified, possesses a fort and two batteries in good repair. It has been made the imperial arsenal, and is very strong towards the sea. The town contains about four hundred houses, which extend from the banks of the river up the steep declivity of a hill facing the north. It was built, as well as the principal fortifications, by Christians. The streets are paved; there are several mosques, and a decent bazaar, surrounded with very handsome stone piazzas; but there is a great deficiency of water. The depth and security of the river, which is about half a mile across at the ferry, render it the best port which the emperor possesses for his larger vessels; but ships exceeding two hundred tons burden cannot get in, on account of the bar, which is continually on the increase. The road is not secure in winter during the prevalence of southerly and westerly winds, but from April to September inclusive it affords a safe anchorage. The climate is mild, and the same as in Andalusia. Larache is situated in long. 6. 1. 30. W. and lat. 35. 13. 15. N.

LARARIUM was a chapel which the Romans frequently had in their houses for the household gods, called *lares.* Spartian informs us, that Alexander the son of Mammeus kept in his *lararium* the figure of our Saviour, together with his other idols.

LARBOARD, amongst seamen, the left-hand side of the ship when you stand with your face towards the head.

LARCENY, or THEFT, by contraction for latrociny, *latrocinium*, is distinguished by the law into two sorts; the one called *simple larceny*, or plain theft, unaccompanied with any other atrocious circumstance; and the other, *mixed* or *compound larceny*, which also includes in it the aggravation of a taking from one's house or person.

Simple larceny, when it is the stealing of goods above the value of twelvepence, is called *grand larceny*, but when of goods to that value, or under, is *petit larceny;* offences which are considerably distinguished in their punishment, but not otherwise. *Mixed* or *compound* larceny is such as has all the properties of the former, but is accompanied with either one or both of the aggravations of a taking from the *house* or the *person*.

LARDNER, Nathaniel, an eminent English dissenting divine, was born at Hawkhurst, in Kent, on the 6th of June 1684. After receiving a grammatical education, he was sent first to a dissenting academy in London, which was under the care of the Rev. Dr Joshua Oldfield; and thence, in his sixteenth year, he went to prosecute his studies at Utrecht, under Professors d'Uries, Grævius, and Burmann. Here he remained above three years, and then removed for a short time to Leyden. In 1703 he returned to England, and at his father's house employed himself in the most close and diligent preparation for the sacred profession. But, notwithstanding his qualifications, it was not till 1709 that he preached his first sermon, on the authenticity and truth of the Christian revelation.

A few years after this, Lardner was received into Lady Treby's family as domestic chaplain, and tutor to her son, and continued in this situation till her ladyship's death in 1721. This event threw him into some perplexity, having preached to several congregations, during his residence with Lady Treby, without obtaining the approbation or choice of any one. It has been said that it reflects no honour upon the dissenters, that a man of such merit should so long have been neglected. But the pulpit was not the place in which Mr Lardner was calculated either to convey improvement or to acquire reputation. Dr Kippis informs us, "that his mode of elocution was very unpleasant; that from his early and extreme deafness he could have no such command of his voice as to give it a due modulation; and that he greatly dropped his words." It cannot, then, be matter of surprise that he was not popular; nor can it be any reflection upon the congregations to which he occasionally preached, that they did not choose a man who, notwithstanding his great learning and eminent virtues, was so deficient as a public speaker, that it was impossible to hear him with any pleasure, and scarcely without pain.

Though Mr Lardner had no church at which he officiated as minister, he was engaged with some of his dissenting brethren in preaching a Tuesday evening lecture at the Old Jewry. Acquainted probably with the direction of his studies, they also appointed him to preach on the proof of the credibility of the gospel history. This he discussed in two sermons; and prosecuting the subject which he had taken up in these discourses, he, in February 1727, published, in two volumes octavo, the first part of the Credibility of the Gospel History, or the Facts occasionally mentioned in the New Testament, confirmed by Passages of Ancient Authors who were contemporary with our Saviour or his Apostles, or lived near their time. An appendix was subjoined, relating to the time of Herod's death.

Thus Mr Lardner commenced author, and began his literary career with singular reputation. "It is scarcely necessary to say," observes Dr Kippis, "how well this work was received by the learned world. Not only was it highly approved by the Protestant dissenters, with whom the author was more immediately connected, but by the clergy in general of the established church; and its reputation gradually extended into foreign countries. It is indeed an invaluable performance, and has rendered the most essential service to the cause of Christianity. Whoever peruses this work will find it replete with admirable instruction, sound learning, and just and candid criticism." These two, with the subsequent fifteen volumes octavo, and the four thin quartos entitled Jewish and Heathen Testimonies, occupied him, with the interruption arising from some smaller productions, during the space of forty-three years.

Dr Kippis gives us a particular account of the time when each volume was published, and of the subjects discussed in each. Speaking of the Supplement to the Credibility, he says, "I cannot avoid strongly recommending this work to the attention of all young divines. Indeed, I think that it ought to be read by every theological student before he quits the university or academy in which he is educated. There are three other works which will be found of eminent advantage to those who are intended for, or beginning to engage in, the Christian ministry. These are, Butler's Analogy, Bishop Law's Considerations on the Theory of Religion, and Dr Taylor's Key to the Apostolical Writings, prefixed to his Paraphrase on the Epistle to the Romans. Without agreeing with every circumstance advanced in these works, it may be said of them with the greatest truth, that they tend to open and enlarge the mind; that they give important views of the evidence, nature, and design of revelation; and that they display a vein of reasoning and inquiry which may be extended to other objects besides those immediately considered in the books themselves. It must not be forgotten, that the Supplement to the Credibility has a place in the excellent collection of treatises on divinity which have been published by Dr Watson, bishop of Landaff. For a collection which cannot fail of being eminently conducive to the instruction and improvement of younger clergymen, and for the noble, manly, and truly evangelical preface by which it is preceded, this great prelate is entitled to the gratitude of the Christian world." It may not be improper to add, that the Supplement to the Credibility has been published separately by the booksellers, under the title of the History of the Gospels and Epistles.

Applauded as Dr Lardner's works were, he received little recompense for them. Some of the latter volumes of the Credibility were published at a loss; and at last he sold the copyright and all the remaining printed copies to the booksellers, for the trifling sum of L.150. His object, however, was not private emolument, but to serve the interests of truth and virtue; and it pleased divine providence to spare his life, both to complete his extensive plan, and to see the last volume, the fourth of the Testimonies, published. This was in 1767. But he was seized with a decline in the following summer, and carried off in a few days, at Hawkhurst, the place of his nativity, where he had a small paternal estate. He died in the eighty-fifth year of his age.

LARENTINALIA, in *Antiquity*, a feast held amongst the Romans on the 23d day of December, but ordered to be observed twice a year by Augustus. It was supposed by some to have been instituted in honour of the Lares, but by others, with more probability, in honour of Acca Laurentia, and to have been the same with Laurentalia.

LARES, amongst the ancients, derived by Apuleius from *lar familiaris*, a kind of domestic genii or divinities, worshipped in houses, esteemed the guardians and protectors of families, and supposed to reside more immediately in the chimney corner. The Lares were distinguished from the Penates, as the former were supposed to preside over housekeeping, the servants in families, and domestic affairs; whilst the latter were the protectors of the masters of families, their wives, and children. Accordingly the Lares were dressed in short, succinct habits, to show their readiness to serve; and they held a sort of cornucopia in their hands, as a signal of hospitality and good housekeeping. According to Ovid, there were generally two of them, who were sometimes represented with a dog at their feet. Plutarch distinguishes good and evil Lares, as he had before done good and evil genii. There are also some public, others private Lares. Apuleius tells us the domestic Lares were no more than the souls of departed persons, who had lived well, and had discharged the duties of their station;

whereas those who had done otherwise were vagabonds, wandering about and frightening people, called *Larvæ* and *Lemures*. The Lares were also called *Penates*, and were worshipped under the figures of little marmosets, or images of wax, silver, or earthen ware. The public Lares were also called *Compitales*, from *compitum*, a cross-way; and *Viales*, from *via*, a way or public road; as being placed at the meetings of roads and in the highways, and esteemed the patrons and protectors of travellers. The private Lares took care of particular houses and families, and were also called *Præstites*, from *præsto*. The Lares were likewise genial gods, and were supposed to take care of children from their birth. It is for this reason that, when Macrobius tells us the Egyptians had four gods who presided over the births of children, viz. Genius, Fortune, Love, and Necessity, called *Præstites*, some interpret him as if he had said the Egyptians had Lares, and they have mentioned that there was a great difference between the Lares of the Romans and the Præstites of the Egyptians. However, the learned Mr Bryant affirms that they were the same. The ancients differ extremely about the origin of the Lares. Varro and Macrobius say that they were the children of Mania; Ovid makes them the issue of Mercury, and the Naiad Lara or Larunda; Apuleius assures us that they were the posterity of the Lemures; Nigridius, according to Arnobius, makes them sometimes the guardians and protectors of houses, and sometimes the same with the Curetes of Samothracia, which the Greeks call *Idæi Dactyli*. Nor was Varro more consistent in his opinion of these gods; sometimes making them the manes of heroes, and sometimes gods of the air. Titus Tatius, king of the Sabines, was the first who built a temple to the Lares. The chimney and fire-place in the house were particularly consecrated to them. Tertullian is of opinion that the custom of worshipping the Lares arose from this, that they anciently interred their dead in their houses; and hence the credulous people took occasion to imagine that their souls continued there also, and thus proceeded to pay them divine honours. To this it may be added, that the custom being afterwards introduced of burying in the highways, they might hence take occasion to regard them as gods of the highways. The victim offered to the Lares in the public sacrifices was a hog; but in private they were offered wine, incense, a crown of wool, and a little of what was left at the table. They also crowned them with flowers, particularly the violet, myrtle, and rosemary. Their symbol was a dog, which was usually represented by their side, on account of its fidelity and the service it does to a man in watching his house. They were sometimes also represented as clothed in a dog's skin. The term *Lares*, according to Mr Bryant, was formed from *laren*, an ancient word by which the ark was represented. He supposes that the Lares and Manes were the same domestic deities under different names; and that by these terms the Etruscans and Latins denoted the *dii arkitæ*, who were no other than their arkite ancestors, or the persons preserved in the laren or ark, the genius of which was Isis, the reputed parent of the world. He observes further, that they are described as demons and genii, who once lived upon earth, and were gifted with immortality. Arnobius styles them *Lares quosdam genios et functorum animas*; and he says that, according to Varro, they were the children of Mania. Huetius (*Demonst. Prop.* iv. p. 139) adds, that Mania had also the name of Larunda; and that she is styled the mother of the demons. By some she is called Lara, and was supposed to preside over families; and children were offered at her altar in order to procure her favour. Instead of these, they offered in after times the heads of poppies and pods of garlic.

LARGE, a nautical term applied to the wind when it crosses the line of a ship's course in a favourable direction, particularly on the beam or quarter. Thus, if a ship steers west, then the wind in any point of the compass to the eastward of the south or north may be called *large*, unless when it is directly east, and then it is said to be right aft. Sailing large is, therefore, advancing with a large wind, so as that the sheets are slackened and flowing, and the bowlines entirely disused. This phrase is generally opposed to sailing close-hauled.

LARGITIO, in Roman antiquity, was a distribution of corn, provision, clothes, money, and the like, amongst the people. Gracchus, when tribune, in order to render himself popular, passed a law for supplying the Roman citizens with corn out of the public granaries at a very low rate. Claudius, another tribune, with the same view to popular applause, procured it to be distributed *gratis*. Cato, to win the common people from Cæsar, persuaded the senate to do the same; and three hundred thousand citizens shared in the distribution. Cæsar, after his triumph, extended his bounty to a hundred and fifty thousand, giving them each a mina. The Roman emperors enlarged still further the list of those who were to partake of their distributions. *Largitio* is frequently taken in a bad sense, to signify masked or secret bribery, by which candidates purchased votes when they stood for places of honour or trust in the state. The distribution of money was called *congiarium*, and the distributors *divisores* and *sequestres*.

LARGO, Upper and Nether, is the name of two small villages of Fifeshire, situated near the shore of the Frith of Forth. The former is a very agreeable place, about a mile from the sea, on the road between Leven and Anstruther. It has a parish church, an ancient Gothic fabric, with a spire rising from the middle. Nether Largo is an extensive fishing village, much resorted to as summer quarters. This was the birth-place of Alexander Selkirk, the accredited prototype of the fictitious Robinson Crusoe. The weaving of linen is a source of emolument both here and at Upper Largo.

LARGS, a small village on the west coast of Scotland, opposite to the island of Bute. It contains only about 500 inhabitants, but is rendered memorable by the defeat which the Norwegians sustained here, in their last invasion of Scotland.

LARISSA, a city of ancient Thessaly, in the Turkish province of Tirhala. It is situated on the river Salambria, the ancient Peneus, over which is a fine bridge of ten arches. It is surrounded with walls, and contains two large and twenty smaller mosques, several Greek churches, and 4000 houses, with 25,000 inhabitants. It is the greatest manufacturing town in the Turkish empire, producing silk and cotton goods, leather, and ironmongery. The environs are pleasant and fertile, yielding abundance of grapes, figs, raisins, and excellent corn and pulse; but the situation is marshy, and somewhat unhealthy. It is in long. 22. 46. E. and lat. 39. 48. N.

LARISTAN, a province of Persia, which extends along the northern shore of the Persian Gulf, from the fifty-fifth to the fifty-eighth degree of east longitude. It is bounded by Fars on the north-west, and Kerman on the north-east, and is the poorest and least productive province of Persia. The country is arid, and so destitute of wholesome water, that it would be uninhabitable were it not for the periodical rains, which fill the cisterns of the natives, and enable them to cultivate the date tree, together with a small quantity of wheat and barley. The coast is in possession of the different Arab tribes, who, under the government of their own sheiks, maintain their independence, and pay a trifling tribute to the king. They subsist chiefly by piracy, and reside in small towns or mud forts scattered along the shore of the gulf. The chief town, besides Lar, the capital, is Congoon, containing 6000 or 7000 inhabitants.

LARK. See Ornithology.

LARMIER, in *Architecture*, a flat square member of the cornice, below the cimasium, and jetting out farthest. It is so called from its use, which is to disperse the water, and cause it to fall at a distance from the wall, drop by drop, or as if by tears, the French word *larme* signifying a tear.

LARREK, a small island in the Persian Gulf, about fifteen miles in circumference, with a little conical hill in its centre. It has no harbour, and is destitute both of water and vegetation. It is ten miles south-west of Ormuz.

LARVA, in *Natural History*, a name given by Linnæus to insects in that state which is called by other writers *eruca* or *caterpillar*.

LARVÆ, in *Antiquity*, derived from the Etruscan word *lar* or *lars*, signifying "prince or lord," denoted the ghosts of the deceased, considered as wicked and mischievous. Hence is formed the term *larvatus*, that is, *larva indutus* or *demoniac*. The ingenious Mr Farmer urges the etymology and use of this term to prove that the heathen demons were human ghosts. The *larvæ* were also called *lemures*.

LARUS, the gull. See ORNITHOLOGY.

LASCARIS, CONSTANTINE, one of those illustrious Greeks who, having been expelled from their native country in the fifteenth century, contributed greatly to the revival of letters in Europe. He was descended of the imperial family of the same name, and born at Constantinople, though in what year has not been ascertained. In 1454, he left the imperial city, destined soon afterwards to become the prey of the Turkish invaders, and went to seek an asylum in Italy, where he was favourably received by Francisco Sforza, who intrusted him with the education of his daughter Hippolyta, afterwards married to Alfonzo king of Naples. From Milan he proceeded to Rome, where he lived some time in habits of intimacy with Cardinal Bessarion, and then set out for Naples, whither he had been invited by King Ferdinand, in order to profess Greek and rhetoric in that city. Having spent some years in this occupation, he formed the resolution of going to end his days in one of the isles of Greece; but the vessel in which he had embarked having touched at Messina, the principal inhabitants made to him such urgent applications, that he consented to give lessons in their city. The reputation of this great master of learning soon attracted thither numerous pupils, amongst whom the celebrated Bembo is said to have been one; and he received the honour of citizenship, which he merited equally by his virtues and his erudition. He lived to an advanced age, and died towards the end of the year 1493. In gratitude for the proofs of regard which he had received from the senate, he bequeathed to it, by his will, his library, consisting of valuable manuscripts, which were afterwards transported to Spain, where they may still be seen in the Royal Library of the Escurial. His published works are, 1. Grammatica Græca, sive Compendium octo Orationis partium, Milan, 1476, in 4to, being the first book printed in Greek; 2. Two *Opuscula* on the Sicilians and Calabrese who had written in Greek, published, for the first time, by Maurolico in 1562; 3. A Dissertation on Orpheus, printed in the first volume of the *Marmora Taurinensia*, from a manuscript in the library of the king of Sardinia. (A.)

LASCARIS, *Andrew John*, a learned Greek, of the same family with the preceding, and surnamed *Rhyndacenus*, probably because he was originally from Rhyndacus, a small town between the Hellespont and Phrygia. He abandoned his native country after the overthrow of the lower empire, and took refuge at the court of Lorenzo de' Medicis. This great protector of letters sent him back to the East to collect such manuscripts as had escaped the fury of the Turks; and having obtained permission to examine the libraries, he derived from them a great number of valuable works. Some years afterwards, he made a second voyage to Greece; but before his return Lorenzo died, and the troubles which broke out in Florence determined Lascaris to accept the offers made to him by Charles VIII. in order to draw him to France. He was at Paris in the year 1495; and it was he who taught the principles of the Greek language to Budé and to Danes. In 1503, Louis XII. appointed him to the embassy of Venice; a mission in which he must have acquitted himself in a satisfactory manner, since he was sent thither a second time in 1505. Nevertheless, Wicquefort pretends that Lascaris was but ill qualified for an employment which required a knowledge of the interests of princes, and great experience of the world; and he even asserts that the Venetians complained that France had sent them a pedant instead of an ambassador. His functions ceased in consequence of the rupture which took place between the republic and France; and Lascaris resumed the teaching of the Greek language. Leo X. having conceived the design of extending the knowledge of this language, called him to Rome, to put him at the head of the college of young Greeks which he had just founded; and at the same time confided to him the direction of a printing establishment destined to multiply impressions of Greek books. In 1515, the pope intrusted him with a mission to Francis I.; and this prince, sensible of his merits, endeavoured to retain him in France. Lascaris, however, returned to Rome the same year; but he revisited Paris in 1518, and, along with Budé, was employed to form the royal library of Fontainebleau. Francis I. then appointed Lascaris his ambassador to Venice, as his predecessor had done; and he remained in that city until Pope Paul III. testified a desire to have him at Rome. He yielded to the solicitations of the pontiff, though suffering from the gout, and immediately set out for the capital of the Christian world; but the fatigue of the journey augmented his sufferings, and he died, in 1535, a few months after his arrival, at the advanced age of nearly ninety. Lascaris did not deem it unworthy of him to act as corrector of the press, first in the office of F. Alopa at Florence, and next in the printing-house established by Pope Leo X. in Monte-Cavallo; and we are indebted to him for excellent editions of the following works, viz. I. Anthologia Epigrammatum Græcorum, libri vii. Græce, Florence, 1494, in 4to; 2. Callimachi Hymni Gr. cum scholiis Græcis, ibid. in 4to, the *editio princeps*, executed with the same characters as the preceding work; 3. Scholia Græca in Iliadem, in integrum restituta, Rome, 1517, in folio, a very rare edition; 4. Homericarum Quæstionum, liber, et de Nympharum antro in Odyssea opusculum, ibid. 1518, in small 4to, the *editio princeps;* 5. Commentarii [Græci] in septem Tragœdias Sophoclis, ibid. 1518, in small 4to. Lascaris wrote in Latin with equal facility and elegance; and he was entreated to undertake the translation of several Greek authors, but he has only rendered some treatises of Polybius on the military art. Several smaller works are also ascribed to him, viz. 1. Epigrammata Græca et Latina, Paris, 1527, in 8vo, and 1544, in 4to; 2. De veris Græcarum Litterarum formis ac causis apud Antiquos, Paris, 1536, in 8vo; 3. Orationes, Francfort, 1575. The *Nuova Scielta di Lettere*, by Bernardo Pino, contains one of Lascaris. (A.)

LASH, or LACE, in nautical language, signifies to bind or make fast; as, to lash the bonnet to the course, or the drabbler to the bonnets. The carpenter takes care that the spare yards are lashed fast to the ship's side; and in a rolling sea, the gunners mind that the guns are well lashed, lest they should break loose. Lashers are properly those ropes which bind fast the tackles and the breechings of the ordnance, when hauled or made fast within board.

LASPHE, a town of Prussian Westphalia, in the government of Arensburg, and circle of Witgenstein. It stands on the river Lahn, and contains 160 houses, with 1720 inhabitants, who are chiefly occupied in making iron wares. Adjoining to the city is the palace of Prince Witgenstein, whose dominions, now mediatised, extended over 170 square miles, and comprehended two towns, twenty-eight villages, and 120 houses, with 8800 inhabitants.

LASSA, a town of Thibet, and capital of a province of the same name. It is the capital of the country, and the seat of the Delai Lama. It belongs, however, to the Chinese, who have a viceroy here, with a garrison, commanded by a general officer, whose influence is superior to that of the lamas. It has been visited by few Europeans, and only by Catholic missionaries, who have left no very accurate or satisfactory description of it. The territory extends as far west as Kheroo, distant 350 miles west-south-west, which is within its limits. The city of Lassa is usually crowded with royal and noble personages from all parts of Asia, who come to present their homage, with splendid offerings, to the Delai Lama. His temple is crowned with a gilded dome, and adorned with numerous pyramids, either gilt or crowned with silver. Long. 91. 25. E. Lat. 29. 30. N.

LAST, in general, signifies the burden or load of a ship. It signifies also a certain measure of fish, corn, wool, leather, and the like. A last of cod-fish, white herrings, meal, and ashes for soap, is twelve barrels; of corn or rapeseed, ten quarters; of gunpowder, twenty-four barrels; of red herrings, twenty cades; of hides, twelve dozen; of leather, twenty dickers; of pitch and tar, fourteen barrels; of wool, twelve sacks; of stock fish, one thousand; of flax or feathers, 1700 lbs.

LASTAGE, or Lestage, a duty exacted in some fairs and markets, for carrying things bought whithersoever one pleases to order. It signifies also the ballast or lading of a ship, and is sometimes used for garbage, rubbish, or such like filth.

LASUS, or Lassus, a Greek poet and musician, respecting whom only a few facts have been transmitted to us. He was the son of Charbinus, a native of Hermione, in Argolis, and flourished about the sixty-ninth olympiad (B. C. 504), during the reign of Darius I. king of Persia. Some of the ancients put Lasus in the number of the seven wise men of Greece, to the exclusion of Periander of Corinth. He was the first who wrote on the theory of music, and joined example to precept, being also an excellent musician. According to Clemens of Alexandria, he was the inventor of dithyrambic verse; he was at least the first to introduce it at the public games, and instituted prizes for the successful candidates. (Suidas, *Aristoph. Schol. Vesp.* 1401.) We are informed by Herodotus (vii. 6), that Lasus caused the poet Onomacritus to be banished from Athens by Hipparchus, because he interpolated the poetry of Musæus with false prophecies. He was the contemporary of Simonides, and the instructor of Pindar. (*Thom. Mag. Vit. Pind.*) Athenæus (viii. 20) has preserved some witticisms of Lasus, which do not tend to raise him in our estimation. He quotes also a hymn to Ceres of Hermione, and an ode entitled the Centaurs, in neither of which he had made use of the letter S (x. 455; xiv. 624). (See *Les Remarques de Burette sur le Dialogue du Plutarque touchant la Musique*, in the *Mém. de l'Acad. des Inscrip.* xv. p. 324.)

LASWAREE, a small village of Hindustan, in the province of Delhi, the scene of a desperate battle fought between the British army and Scindia, in which the former obtained a complete victory.

LATERAN was originally the proper name of a man, from whom it descended to an ancient palace in Rome, and to the buildings since erected in its place, particularly a church called St John of Lateran.

Councils of the Lateran are those which were held in the basilica of the Lateran. Of these there have been five, which were held in 1123, 1139, 1179, 1215, and 1513, respectively.

Canons Regular of the Congregation of the Lateran is a congregation of regular canons, of which that church is the principal place or seat.

It is pretended that there has been an uninterrupted succession of clerks, living in community, from the time of the apostles; and that a number of these were established in the Lateran in the time of Constantine. But the canons were not introduced till the time of Leo I.; and these held the church eight hundred years, till the reign of Boniface, who took it from them, and placed secular canons in their room. A century and a half thereafter, the regulars were reinstated.

A LATERE, a term used to denote the qualifications of the cardinals whom the pope sends as legates into foreign countries. They are called "legates *a latere*," as being his holiness's assistants and counsellors in ordinary. They are the most considerable of all the legates, being such as the pope commissions to take his place in councils; and they are so called because he never confers this office on any but his favourites and confidants, who are always *a latere*, at his side. A legate *a latere* has the power of conferring benefices without a mandate, and of legitimating bastards; and a cross is carried before him as the ensign of his authority.

De Latere, legates who are not cardinals, but yet are intrusted with an apostolic legation.

LATEEN Sail, a long triangular sail extended by a lateen yard, and frequently used in xebecs, polacres, setees, and other vessels which navigate in the Mediterranean Sea.

LATH, in building, a long, thin, and narrow slip of wood nailed to the rafters of a roof or ceiling, in order to sustain the covering.

LATHAM, a township in the parish of Ormskirk, in the hundred of West Derby, in the county of Lancaster, 210 miles from London. The castle here formerly belonged to the Earls of Derby, and was boldly defended against the parliament forces in the civil war in 1648. There is a mineral spring, from which Epsom salt is made. The population amounted in 1801 to 2179, in 1811 to 2514, in 1821 to 2997, and in 1831 to 3272.

LATHE, a very useful engine for the turning of wood, ivory, metals, and other materials. The invention of the lathe is very ancient. According to Diodorus Siculus, the first who used it was a grandson of Dædalus, named Talus. Pliny ascribes it to Theodore of Samos, and mentions one Thericles, who rendered himself famous by his dexterity in managing the lathe. With this instrument the ancients turned all kinds of vases, many of which they enriched with figures and ornaments in bas-relief. The Greek and Latin authors make frequent mention of the lathe; and Cicero calls the workmen who used it *vascularii*. It was a proverb amongst the ancients, to say a thing was formed in the lathe, in order to express its delicacy and justness. The lathe is composed of two wooden cheeks or sides, parallel to the horizon, having a groove or opening between, and perpendicular to these are two other pieces called *puppets*, made to slide between the cheeks, and to be fixed down at any point at pleasure. These have two points, between which the piece to be turned is sustained. The piece is turned round backwards and forwards by means of a string put round it, and fastened above to the end of a pliable pole, and underneath to a treadle or board moved with the foot. There is also a rest which bears up the tool, and keeps it steady. As it is the use and application of this instrument that forms the greatest part of the art of turning, we refer for the particular description of it, as well as the manner of applying it in various works, to that head. See TURNING.

LATHREVE, LEIDGREVE, or TRITHENGREVE, was an officer under the Saxon government, who had authority over a third part of the county, and whose territory was therefore called *trithing*, otherwise a *leid* or *leithin*, in which manner the county of Kent is still divided. As to the jurisdiction of this officer, those matters which could not be determined in the hundred court were thence brought to the trithing, where all the principal men of the three or more hundreds being assembled by the *lathreve* or *trithingreve*, debated and decided it; or if they could not, then the *lathreve* sent it up to the county court, to be there finally determined.

LATIAR, in Roman antiquity, a feast or ceremony instituted by Tarquinius Superbus, in honour of Jupiter Latiaris or Latialis.

LATICLAVE (*Laticlavium*), in Roman antiquity, was an honourable distinction, peculiar, in the times of the republic, to the senators; but whether it was a particular kind of garment, or only an ornament upon it, the critics are not agreed. The more general opinion, however, is, that it was a broad stripe of purple sewed upon the fore part of the tunic, and round the middle of the breast. There were buttons set on the *latus clavus* or *laticlave*, which appeared like the heads of large nails, from which some think it derived its name. The senators, prætors, and chief magistrates of colonies and municipal cities, had a right to wear it. The prætexta was always worn over it; but when the prætor pronounced sentence of death, the prætexta was then put off, and the laticlave retained. The *laticlavium* differed from the *angusticlavium;* but authors do not agree in what this difference consisted. The most general opinion, however, seems to be, that the slips or stripes of purple were narrower in the angusticlave.

LATIMER, HUGH, bishop of Worcester, was born about the year 1480, at Thurcaston, in Leicestershire. He was the only son of a yeoman of that village. At the age of fourteen he was sent to Christ's College, Cambridge, where he applied himself to the study of divinity, and in proper time took the degree of bachelor in that science. At this time he was a zealous Catholic, and was honoured with the office of keeper of the cross to the university; but when he was about thirty years of age, he became a convert to the Protestant religion; and being then one of the twelve licensed preachers of Cambridge, he promulgated his opinions with great freedom. It was not long before he was accused of heresy; and being summoned before Cardinal Wolsey, he was obliged to subscribe certain articles of faith, which he certainly did not believe. About the year 1529 he was presented by the king to the rectory of Westkinton, in Wiltshire, to which place, after residing some time at court with his friend and patron Dr Butts, he retired; but having resumed his former invectives against the Catholic doctrines, he was again summoned to answer certain interrogatories, and again obliged to subscribe a recantation. In 1535, he was promoted to the bishopric of Worcester, a dignity which he continued to enjoy till the year 1539, when, rather than assent to the act of the six articles, he resigned his mitre, and retired into the country; but in a short time he was accused of speaking against the six articles, and committed to the Tower, where he continued prisoner till the death of Henry VIII. which happened in January 1547. On the accession of Edward VI. Latimer was released, but not restored to his bishopric, though he had preached several times before the king, and continued to exercise his ministerial functions with unremitting zeal and resolution. But young Edward finished his short reign in the year 1553; and Mary having ascended the throne, Latimer was immediately doomed to destruction, and, together with Cranmer and Ridley, confined in the Tower. In April 1554, they were removed to Oxford, that they might dispute with the learned doctors of both universities. Latimer declined the disputation on account of his great age and infirmities, but delivered his opinion in writing; and, having refused to subscribe the Romish creed, was condemned for heresy, and, in the October following, burned alive, along with Bishop Ridley. He behaved with uncommon fortitude on the occasion, and died a real martyr to the Reformation. His general character is that of a learned, virtuous, and brave man. His works are, 1. Sermons, 1635, in folio; 2. Letters in Fox's Acts and Monuments (vol. ii.), 1580; 3. An Injunction to the Prior and Convent of St Mary's in Worcestershire.

LATIN, a dead language, first spoken in Latium, and afterwards at Rome. See LANGUAGE and PHILOLOGY.

LATINUS, king of the Latins in Italy, was the son of Faunus, and, it is said, began to reign about 1216 years before the Christian era. Lavinia, his only daughter, married Æneas, after that Trojan prince had killed Turnus king of the Rutulians.

LATISANA, a town of Italy, the capital of a district in the Austrian delegation of Frioul, on the river Tagliamento. There is a fine palace belonging to the Mocenego family. It contains 3890 inhabitants, whose trade is chiefly in timber. Long. 13. 8. 40. E. Lat. 45. 54. 10. N.

LATITUDE, in *Astronomy*, is the distance of a star north or south from the ecliptic. In geography it signifies the distance of any place north or south from the equator. See ASTRONOMY, and GEOGRAPHY, *passim*.

LATITUDINARIAN, a person of moderation respecting religious opinions, who believes there is a latitude in the road to heaven, which may admit people of different persuasions.

LATIUM, in *Ancient Geography*, the country of the Latins, at first contained within very narrow bounds, but afterwards increased by the accession of various tribes and races. The appellation, according to Virgil, is *a latendo*, from Saturn's lying hid there from the hostile pursuit of his son Jupiter; and from *Latium* comes *Latini*, the name of the people, though Dionysius of Halicarnassus derives it from King Latinus, who reigned about the time of the Trojan war. But, be this as it may, it is certain, that Latium, when under Æneas and his descendants, or the Alban kings, contained only the Latins, exclusive of the Æqui, Volsci, Hernici, and other people; but that Æneas reckoned the Rutulians, after their conquest, amongst the Latins. And this constituted the ancient *Latium*, confined to the Latins; but afterwards, under the kings, and subsequently, it reached from the Tiber to Circeii. Under the consuls, the country of the Æqui, Volsci, Hernici, and others, after long and bloody wars, was added to Latium, under the appellation of *adjectitious* or *superadded Latium*, as far as the river Liris, the eastern boundary, and to the north as far as the Marsi and Sabines. The various people which in succession occupied Latium, were the aborigines, the Pelasgi, the Arcades, the Siculi, the Arunci, the Rutuli; and beyond Circeii, the Volsci, the Osci, and the Ausones; but the question as to who first, and who next, occupied the country, it is exceedingly difficult to resolve.

LATMUS, in *Ancient Geography*, a mountain of Ionia, or on the confines of Caria, famous for the fable of Endymion, of whom the Moon was said to be enamoured: hence called *Latmius Heros*, and *Latmius Venator*.

LATOMIA properly signifies a *stone quarry;* but the places whence stones had been dug having been made use of sometimes as dungeons, jails, or prisons for criminals, it is often applied as a name for a prison. There was a place of confinement of this sort at Rome, near the Tullianum, and another at Syracuse, in which Cicero says Verres had shut up Roman citizens.

LATONA, in *Mythology*, a goddess, whose history is very obscure. Hesiod makes her the daughter of Titan Coeus, and Phœbe his sister. She was admired for her beauty, and celebrated for the favours which she granted to Jupiter. Juno, always jealous of her husband's amours, made Latona the object of her vengeance, and sent the serpent Python to disturb her peace and persecute her. Latona wandered from place to place during the time of her pregnancy, continually alarmed for fear of Python. She was driven from heaven; and Terra, influenced by Juno, refused to give her a place where she might rest and bring forth. Neptune, moved with compassion, struck with his trident and made immoveable the island of Delos, which had before wandered in the Ægean, appearing sometimes above and sometimes below the surface of the sea. Latona, changed into a quail by Jupiter, came to Delos, where she resumed her original shape, and gave birth to Apollo and Diana, leaning against a palm tree or an olive. But her repose was of short duration. Juno discovered the place of her retreat, and obliged her to fly from Delos. She wandered over the greater part of the world; and in Caria, where her fatigue compelled her to stop, she was insulted and ridiculed by the peasants, of whom she asked for water whilst they were weeding a marsh. Their refusal and insolence provoked her, and she entreated Jupiter to punish their barbarity. They were all changed into frogs. She was also insulted by Niobe, who boasted herself greater than the mother of Apollo and Diana, and ridiculed the presents which the piety of her neighbours had offered to Latona. At last, Latona, though persecuted and exposed to the resentment of Juno, became a powerful deity, and saw her children receive divine honours. Her worship was generally established where her children received adoration; particularly at Argos, Delos, and other places, where she had temples. She had an oracle in Egypt, celebrated for the true and decisive answers which it gave. Latona, Venus, and Diana, were the three goddesses most in veneration amongst the Roman women.

LA TOUR DU PIN, an arrondissement of the department of the Isère, in France, 556 square miles in extent. It comprehends eight cantons, divided into 125 communes, and contains 106,500 inhabitants. The capital is the city of the same name, situated in a pleasant valley on the river Bourbon, but containing only 1550 inhabitants.

LATRINÆ were public houses, or necessaries, amongst the Romans. We do not find, in the writings or buildings that remain of antiquity, that they had any such in their dwellings.

LATRUNCULI, a game amongst the Romans, of much the same nature with our chess. The *latrunculi* were properly the chess-men, called also *latrones* and *calculi*. They were usually made of glass, and distinguished by black and white colours; but sometimes they were made of wax or other convenient substances. The invention of this game is by some ascribed to Palamedes when at the siege of Troy; Seneca attributes it to Chilon, one of the seven Grecian sages; others honour Pyrrhus with the invention; and others again contend that it is of Persian origin. But is not this *lis de lana caprina?* Frequent allusions to this game are met with in the Roman classics; and a little poem was written upon it, addressed to Piso, which some say was the work of Ovid, others of Lucan, in the end of some editions of whose works it is to be found, and to which we refer for a fuller account of the game. This game expresses so well the chance and order of war, that it is, with great appearance of probability, attributed to some military officer as the inventor. One Canius Julius was so exceedingly fond of chess, that after he was sentenced to death by Caligula, he was found playing, and was interrupted in his game by a call to execution; he obeyed the summons, but first desired the centurion who brought the fatal order, to bear witness that he had one man upon the board more than his antagonist, that he might not falsely brag of victory when he should be no more.

LATTALATTA, one of the small islands adjacent to Gilolo, and about twenty-five miles in circumference. It is separated from the island of Jappa by a strait above a mile and a half in length, and in some places not above forty-six yards broad, in others eight miles. There is also a cluster of small islands lying off the west coast of Gilolo, a few minutes to the north of the equinoctial line, and about the 127th degree of east longitude.

LATTEN denotes iron plates tinned over, of which tea-cannisters are made. Plates of iron being prepared of a proper thinness, are smoothed by rusting them in an acid liquor, as common water made eager with rye. With this liquor they fill certain troughs, and then put in the plates, which they turn once or twice a day, that they may be equally rusted over. After this they are taken out, and well scoured with sand; and, to prevent their rusting again, are immediately plunged into pure water, in which they are to be left till the instant they are to be tinned or blanched. The manner of doing this is as follows: They flux the tin in a large iron crucible, which has the figure of an oblong pyramid with four faces, of which two opposite ones are less than the two others. The crucible is heated only from below, its upper part being luted with the furnace all round. The crucible is always deeper than the plates which are to be tinned are long; they always put them in downright, and the tin ought to swim over them; to this purpose artificers of different trades prepare plates of different shapes, though M. Reaumur thinks them all exceptionable. But the Germans use no sort of preparation of the iron to make it receive the tin, more than the keeping it always steeped in water till the time; only when the tin is melted in the crucible, they cover it with a layer of a sort of suet, which is usually two inches thick, and the plate must pass through this before it can come to the melted tin. The first use of this covering is to keep the tin from burning; for if any part should take fire, the suet would soon moisten it, and reduce it to its primitive state again. The blanchers say, this suet is a compound matter. It is indeed of a black colour; but M. Reaumur supposed that to be only an artifice to make it a secret, and that it is only coloured with soot or the smoke of a chimney. But he found it true so far, that the common unprepared suet was not sufficient; for after several attempts, there was always something wanting to render the success of the operation certain. The whole secret of blanching, therefore, was found to lie in the preparation of the suet; and this at length he discovered to consist only in the first frying and burning it. This simple operation not only gives it the colour, but puts it in a condition to give the iron a disposition to be tinned, which it does surprisingly.

The melted tin must also have a certain degree of heat. For if it be not hot enough, it will not stick to the iron; and if it be too hot, it will cover it with too thin a coat, and the plates will have several colours, as red, blue, and purple, and, upon the whole, will have a cast of yellow. To prevent this, by knowing when the fire has a proper degree of heat, they might try with small pieces of iron; but, in general, use teaches them to know the degree, and they put in the iron when the tin is at a different standard of heat, according as they would give it a thicker or thinner coat. Sometimes also they give the plates a double layer, as they would have them very thickly covered. This they do by dipping them into the tin when very hot the first time, and when less hot the second. The tin which is to give the second coat must be fresh covered with suet; and that with the common suet, not the prepared.

LATTEN *Brass*, plates of milled brass reduced to different thickness, according to the uses they are intended for.

LAUBAN, a city, the capital of a circle of the same name, in Prussian Silesia, within the government of Liegnitz. It stands on the Queis, is walled, and contains four churches and 784 houses, inhabited by 4560 persons. Many are employed in making linen and woollen goods and hosiery. A celebrated convent of St Mary Magdalen existed here till 1817, when it was dissolved; its estates comprised six large villages, and 8800 inhabitants.

LAUD, William, archbishop of Canterbury in the seventeenth century, was born at Reading in 1573, and educated in St John's College, Oxford, of which he was afterwards a fellow and reader. In 1610, he took orders. In 1611, he was elected president of St John's College; but his election being disputed, it was confirmed by his majesty. The same year he was sworn the king's chaplain. In 1621, he was nominated bishop of St David's. In 1628, he was translated to the bishopric of London. In 1630, he was elected chancellor of the University of Oxford. In 1633, he attended the king into Scotland, and was sworn a privy councillor of that kingdom. During his stay in Scotland, he formed the resolution of bringing the church of that country to an exact conformity with the church of England. In the same year he succeeded Archbishop Abbot in the see of Canterbury; and soon afterwards came out his majesty's declaration about lawful sports on Sundays, which the archbishop was charged with having revived and enlarged, besides encouraging the vexatious prosecutions of such clergymen as refused to read it in their churches. In 1634–35, the archbishop was put into the great committee of trade and the king's revenue; on the 4th of March following, he was appointed one of the Commissioners of the Treasury; and on the 6th of March 1635–36, he received the staff of lord high treasurer of England. In order to prevent the printing and publishing of what he thought improper books, he procured a decree to be passed in the Star-chamber, on the 11th of July 1637, by which it was enjoined that the master printers should be reduced to a certain number, and that none of them should print any books until they were licensed either by the archbishop or the bishop of London, or by some of their chaplains, or by the chancellors or vice-chancellors of the two universities. A new parliament being summoned, met on the 13th of April 1640, and the convocation assembled the day following; but the Commons launching out into complaints against the archbishop, and insisting upon a redress of grievances before they granted any supply, the parliament was dissolved on the 7th of May. The convocation, however, continued sitting, and made seventeen canons, which were supposed to be formed under the immediate direction of the archbishop. In the beginning of the long parliament he was attacked on account of those canons, which were condemned by the House of Commons on the 16th of December 1640, "as containing many things contrary to the king's prerogative, to the fundamental laws and statutes of this realm, to the rights of parliament, to the property and liberty of the subject, and tending to sedition, and of dangerous consequence." On the 18th of December, he was accused by the Commons of high treason, and committed to the Tower. Being tried before the House of Lords, for endeavouring to subvert the laws, and to overthrow the Protestant religion, he was found guilty, and beheaded on Tower-hill on the 10th of January following, in the seventy-second year of his age. Laud was temperate in his diet, and regular in his private life; but his fondness for introducing new ceremonies, in which he showed a hot and indiscreet zeal, his encouraging of sports on Sundays, his illegal and cruel severity in the Star-chamber and High Commission Courts, and the fury with which he persecuted the dissenters, and all who presumed to contradict his sentiments, exposed him to popular hatred. The following is a correct list of his works, viz. 1. Seven Sermons preached on several occasions, 1651, in 8vo; 2. Short Annotations upon the Life and Death of the most August King James; 3. Answer to the Remonstrance made by the House of Commons in 1628; 4. His Diary by Wharton in 1694, with six other pieces, and several letters, especially one to Sir Kenelm Digby on his embracing Popery; 5. The second volume of the Remains of Archbishop Laud, written by himself, 1700, in folio; 6. Officium Quotidianum, or a Manual of Private Devotions, 1650, in 8vo; 7. A Summary of Devotions, 1667, in 12mo. About eighteen Letters of Laud to Gerard John Vossius have been printed by Colomesius in his edition of *Vossii Epistolæ*, London, 1690, in folio; some others are published at the end of the Life of Usher by Parr, 1686, in folio; and a few more have been inserted by Dr Twells in his Life of Dr Pococke, prefixed to the theological works of that author, 1645, in two vols. folio.

LAUDATIO, in a legal sense, was anciently the testimony delivered in court, to the good behaviour and integrity of life of the person accused. It resembled the custom which prevails in our trials, of calling persons to speak to the character of the prisoner. The least number of the *laudatores* amongst the Romans was ten.

LAUDER, William, a native of Scotland, was educated at the University of Edinburgh, where he finished his studies with great reputation, and acquired a considerable knowledge of the Latin tongue. On the 22d of May 1734, he received a testimonial from the heads of the university, certifying that he was a fit person to teach humanity in any school or college whatsoever. In 1739 he published at Edinburgh an edition of Johnston's Psalms. In 1742, he was recommended by Mr Patrick Cumming and Mr Colin Maclaurin, the professors of church history and mathematics, to the mastership of the grammar school at Dundee, then vacant. Whether he succeeded in his application or not, is uncertain; but a few years afterwards we find him in London, contriving to ruin the reputation of Milton, by an attempt which ended in the destruction of his own. His reason for the attack probably sprung from the virulence of party-spirit, which triumphed over every principle of honour and honesty. He began, in 1747, to retail part of his design in the Gentleman's Magazine; and, finding that his forgeries were not detected, he was encouraged in 1751 to collect them, with additions, into a volume, entitled An Essay on Milton's Use and Imitation of the Moderns in his Paradise Lost, in 8vo. But the fidelity of his quotations had been doubted by several people; and the falsehood of them was soon afterwards demonstrated by Dr Douglas, in a pamphlet entitled Milton Vindicated from the Charge of Plagiarism brought against him by Lauder, and Lauder himself convicted of several Forgeries and gross Impositions on the Public, in a Letter humbly addressed to the Right Honourable the Earl of Bath, 1751, in 8vo. The appearance of this detection overwhelmed Lauder with confusion. He subscribed a confession, dictated by a learned friend, in which he ingenuously acknowledged his offence, which he professed to have been occasioned by the injury he had received from the disappointment of his expectations of profit from the publication of Johnston's Psalms. This misfortune he ascribed to a couplet in Mr Pope's Dunciad (book iv. ver. 3), and thence originated his rancour against Milton. But he afterwards imputed his conduct to other motives, abused the few friends who continued to countenance him, and, finding that his character was not to be retrieved, quitted the kingdom, and went to Barbadoes, where for some time he taught a school. His behaviour there, however, was mean and despicable. He passed the remainder of his life in universal contempt; and died unregretted by any one, some time about the year 1771.

LAUDICOENI, amongst the Romans, applauders, who for reward entered the rehearsal-rooms, attended the repetition of plays, and were in waiting when orations were pronounced, to raise or increase the acclamation and applause.

LAUDOHN, Field-Marshal, a celebrated general in the imperial service, born in 1716, was a native of Livonia, and descended from a Scotch family. He made his first campaigns under Marshal Munich, in the war of 1738, between the Russians and Turks, and was present at the taking of Oczakow, as well as at Choczim, and Stawutzchane, where the Turks were entirely defeated. In 1741 Frederick the Great refused to take young Laudohn into his service, saying he did not like his countenance; but this monarch, who was considered as the greatest general of his age, afterwards observed that he had often admired the positions of other generals, but that he had ever dreaded the battles of Laudohn. In 1756, when but just entered into the service of the house of Austria, with the rank of lieutenant-colonel, he made such rapid progress, that within less than a year he became a general of artillery, and within three years commander-in-chief of the army. He rescued Olmutz when besieged by the Prussians, beat the king himself at Frankfort-on-the-Oder, took General Fouquet prisoner at Zorndorf, carried Glatz and Schweidnitz by assault, and stopped the progress of Frederick in a war which might have proved fatal to the house of Austria. In 1778, when elevated to the rank of field-marshal, at the head of sixty thousand men, he prevented Henry, brother to the king of Prussia, from joining his army to that of the king. At Dubicza, Novi, Grandisca, and Belgrade, in the war between the emperor and the Turks, he had but to present himself before the enemy, and say with Cæsar, *Veni, vidi, vici.* But at his head-quarters in Moravia he was seized with a fever, in consequence of an operation he underwent for an obstruction in the urethra. His impatience under the medical applications, the impetuous ardour of his character, and, above all, the knowledge of his importance in the war, contributed to irritate his mind, and promote the violence of the fever. He resisted the application of cataplasms, before and after the incisions were made, with a fatal obstinacy, which raised the inflammation to such a height, that he expired under an access of fever, on the 14th of July 1790, in the seventy-fourth year of his age.

LAUDS, Laudes, the second part of the ordinary office of the breviary, said after matins, though heretofore it ended the office of the night. The laudes consist principally of psalms, hymns, and the like, and hence they took their name from *laus, laudis*, praise.

LAUENBURG, a duchy in Germany, formerly a part of Hanover, but at the congress of Vienna transferred to Denmark. It extends in longitude from 9. 56. to 10. 37. E. and in latitude from 53. 21. to 53. 48. N., and contains 443 square miles, with one city, one town, and 123 villages, with 34,650 inhabitants. It borders on the Elbe, where there are some rich meadows; but the greater part of the duchy is a poor and sandy soil, yielding little grain excepting rye. There are some extensive woods in the western parts, which afford good oak and beech timber. There are few even of domestic manufactures beyond the spinning of flax, and very little commerce of any kind; and the roads are in the present day by far the worst which are to be met with in Germany. The capital is a city of the same name, situated on the river Elbe, where the Stecnitz falls into that stream. It is an ancient town, with pleasant walks on the side of the smaller river, and contains 460 houses, with 2980 inhabitants. It was built in the year 1157, by Henry the Lion, duke of Saxony, and was the residence of a member of that family till 1697. The church contains many monuments of that race, and has a lofty tower visible over a large circle. Long. 10. 17. 10. E. Lat. 53. 21. 5. N.

LAUFFEN, a city of the kingdom of Wirtemberg, in the circle of the Neckar. It stands on the river of the same name, and contains three churches, 600 houses, and 3630 inhabitants, who grow wine, and have some manufactures.

LAUGHARNE, a market-town of South Wales, in the county of Carmarthen, and hundred of Derlis, 223 miles from London. It stands at the mouth of the river Towy. The market is held on Saturday. The population amounted in 1801 to 1484, in 1811 to 1561, in 1821 to 1953, and in 1831 to 2020.

LAUGHTER, an affection peculiar to mankind, occasioned by something that tickles the fancy.

In laughter the eye-brows are raised about the middle, and drawn down next the nose; the eyes are almost shut; the mouth opens and shows the teeth, the corners of the mouth being drawn back and raised up; the cheeks seem puffed up, and almost hide the eyes; the face is usually red; the nostrils are open; and the eyes are moistened.

Authors attribute laughter to the fifth pair of nerves, which, sending branches to the eye, ear, lips, tongue, palate, and muscles of the cheek, part of the mouth, præcordia, &c. there hence arises a sympathy, or consent, between all these parts; so that when one of them is acted upon, the others are proportionally affected. Hence a savoury thing seen or smelt affects the glands and part of the mouth; a thing seen or heard that is shameful, affects the cheeks with blushes; on the contrary, if it please and tickle the fancy, it affects the præcordia and muscles of the mouth and face with laughter; if it cause sadness and melancholy, it likewise affects the præcordia, and demonstrates itself by causing the glands of the eyes to emit tears. Dr Willis accounts for the pleasure of kissing from the same cause; the branches of this fifth pair being spread to the lips, the præcordia, and the genital parts, hence arises a sympathy between these parts.

The affection of the mind by which laughter is produced is seemingly so very different from the other passions with which we are endowed, that it has engaged the attention of very eminent persons to discover it. Aristotle, in the fifth chapter of his Poetics, observes of comedy, that "it imitates those vices or meannesses only which partake of the ridiculous;" but "the ridiculous," says he, "consists of some fault or turpitude not attended with great pain, and not destructive." "The passion of laughter," says Hobbes, "is nothing else but sudden glory arising from some sudden conception of some eminency in ourselves, by comparison with the infirmity of others, or with our own formerly. For men," continues he "laugh at the follies of themselves past, when they come suddenly to remembrance, except when they bring with them any sudden dishonour." Akenside, in the third book of his poem, treats of ridicule at considerable length. He gives a detail of ridiculous characters; ignorant pretenders to learning, boastful soldiers, and lying travellers; hypocritical churchmen, conceited politicians, and old women that talk of their charms and virtue; ragged philosophers who rail at riches, virtuosi intent upon trifles, romantic lovers, wits wantonly satirical, fops that out of vanity appear to be diseased and profligate, dastards who are ashamed or afraid without reason, and fools who are ignorant of what they ought to know. Having finished the detail of characters, he makes some general remarks on the cause of ridicule, and explains himself more fully in a definition in prose, illustrated by examples. "That which makes objects ridiculous," he observes, "is some ground of admiration or esteem connected with other more general circumstances comparatively worthless or deformed: or it is some circumstance of turpitude or deformity connected with what is in general excellent or beautiful; the inconsistent properties existing either in the objects themselves, or in the apprehension of the person to whom they relate, belonging always to the same order or class of being, implying sentiment and design, and exciting no acute or vehement commotion of the heart." Hutcheson has given another account of the ludicrous quality, and seems to think that it is the contrast or opposition of dignity and meanness which occasions laughter.

But all these opinions are combated by Dr Beattie in his *Essay on Laughter and Ludicrous Composition.* "To provoke laughter," says he, "is not essential either to wit or humour. For though that unexpected discovery of resemblance between ideas supposed dissimilar, which is called *wit,* and that comic exhibition of singular characters, sentiments, and imagery, which is denominated *humour,* do frequently raise laughter, they do not raise it always. Addison's poem to Sir Godfrey Kneller, in which the British kings are likened to heathen gods, is exquisitely witty, and yet not laughable. Pope's *Essay on Man* abounds in serious wit; and examples of serious humour are not uncommon in Fielding's *History of Parson Adams,* and in Addison's account of Sir Roger de Coverley. Wit, when the subject is grave, and the allusions sublime, raises admiration instead of laughter; and if the comic singularities of a good man appear in circumstances of real distress, the imitation of these singularities in the epic or dramatic comedy will form a species of humour, which, if it should force a smile, will draw forth a tear at the same time. An inquiry, therefore, into the distinguishing characters of wit and humour has no necessary connection with the present subject.

"Some authors have treated of ridicule, without marking the distinction between *ridiculous* and *ludicrous* ideas. But I presume the natural order of proceeding in this inquiry, is to begin with ascertaining the nature of what is *purely ludicrous.* Things *ludicrous* and things *ridiculous* have this in common, that both excite laughter; but the former excite pure laughter, the latter excite laughter mixed with disapprobation and contempt. My design is to analyze and explain that quality in things or ideas which makes them provoke *pure laughter,* and entitles them to the name of *ludicrous* or *laughable.*

"When certain objects, qualities, or ideas, occur to our senses, memory, or imagination, we smile or laugh at them, and expect that other men should do the same. To smile on certain occasions is not less natural than to weep at the sight of distress, or cry out when we feel pain.

"There are different kinds of laughter. As a boy, passing by night through a churchyard, sings or whistles in order to conceal his fear, even from himself; so there are men who, by forcing a smile, endeavour sometimes to hide from others, and from themselves too, perhaps, their malevolence or envy. Such laughter is unnatural. The sound of it offends the ear; the features distorted by it seem horrible to the eye. A mixture of hypocrisy, malice, and cruel joy, thus displayed on the countenance, is one of the most hateful sights in nature, and transforms the 'human face divine' into the visage of a fiend. Similar to this is the smile of a wicked person pleasing himself with the hope of accomplishing his evil purposes. Milton gives a striking picture of it in that well-known passage:

> He ceas'd; for both seem'd highly pleas'd; and Death
> Grinn'd horrible a ghastly smile, to hear
> His famine should be fill'd, and blest his maw
> Destin'd to that good hour.

But enough of this. Laughter that makes a man a fiend or a monster I have no inclination to analyze. My inquiries are confined to that species of laughter which is at once natural and innocent.

"Of this there are two sorts. The laughter occasioned by tickling or gladness is different from that which arises on reading the *Tale of a Tub.* The former may be called *animal laughter,* the latter, if it were lawful to adopt a new word which has become very common, I should term *sentimental.* Smiles admit of similar divisions. Not to mention the scornful, the envious, the malevolent smile, I would only remark, that of the innocent and agreeable smile there are two sorts. The one proceeds from the risible emotion, and has a tendency to break out into laughter. The other is the effect of good humour, complacency, and tender affection. This last sort of smile renders a countenance amiable in the highest degree. Homer ascribes it to Venus in an epithet (φιλομμειδης) which Dryden and Pope, after Waller, improperly translate *laughter-loving;* an idea that accords better with the character of a romp or hoyden than with the goddess of love and beauty.

"Animal laughter admits of various degrees; from the gentle impulse excited in a child by moderate joy, to that terrifying and even mortal convulsion which has been known to accompany a change of fortune. This passion may, as well as joy and sorrow, be communicated by sympathy; and I know not whether the entertainment we receive from the playful tricks of kittens and other young animals, may not in part be resolved into something like a fellow-feeling of their vivacity. Animal and sentimental laughter are frequently blended; but it is easy to distinguish them. The former is often excessive; the latter never, unless heightened by the other. The latter is always pleasing, both in itself and in its cause; the former may be painful in both. But their principal difference is this: The one always proceeds from a sentiment or emotion exited in the mind, in consequence of certain ideas or objects being presented to it, of which emotion we may be conscious, even when we suppress laughter; the other arises not from any sentiment or perception of ludicrous ideas, but from some bodily feeling or sudden impulse on what is called the *animal spirits,* proceeding, or seeming to proceed, from the operation of causes purely material. The present inquiry regards that species that is here distinguished by the name of *sentimental laughter.*

"The pleasing emotion, arising from the view of ludicrous ideas, is known to every one by experience; but, being a simple feeling, admits not of definition. It is to be distinguished from the laughter that generally attends it, as sorrow is to be distinguished from tears; for it is often felt in a high degree by those who are remarkable for gravity of countenance. Swift seldom laughed, notwithstanding his uncommon talents in wit and humour, and the extraordinary delight he seems to have had in surveying the ridiculous side of things. Why this agreeable emotion should be accompanied with laughter as its outward sign, or sorrow express itself by tears, or fear by trembling or paleness, I cannot ultimately explain, otherwise than by saying, that such is the appointment of the Author of nature. All I mean by this inquiry is to determine, What is peculiar to those things which produce laughter, or, rather, which raise in the mind that pleasing sentiment or emotion whereof laughter is the external sign.

"Philosophers have differed in their opinions concerning this matter. In Aristotle's definition, quoted above, it is clear that he means to characterize, not laughable qualities in general (as some have thought), but the objects of comic ridicule only; and in this view the definition is just, however it may have been overlooked or despised by comic writers. Crimes and misfortunes are often in modern plays, and were sometimes in the ancient, held up as objects of public merriment; but if poets had that reverence for nature which they ought to have, they would not shock the common sense of mankind by so absurd a representation. The definition from Aristotle does not, however, suit the general nature of ludicrous ideas; for it will appear by and by, that men laugh at that in which there is neither fault nor turpitude of any kind.

"The theory of Mr Hobbes would hardly have deserved notice, if Addison had not spoken of it with approbation in the 47th paper of the *Spectator*. He justly observes, after quoting the words of Mr Hobbes formerly mentioned, that, 'according to this account, when we hear a man laugh excessively, instead of saying that he is very merry, we ought to tell him that he is very proud.' It is strange that the elegant author should be aware of this consequence, and yet admit the theory; for so good a judge of human nature could not be ignorant, that laughter is not considered as a sign of pride; persons of singular gravity being often suspected of that vice, but great laughers seldom or never. When we see a man attentive to the innocent humours of a merry company, and yet maintain a fixed solemnity of countenance, is it natural for us to think that he is the humblest, and the only humble person in the circle?

"Another writer in the *Spectator* (No. 249), remarks, in confirmation of this theory, that the *vainest* part of mankind are most addicted to the passion of laughter. Now, how can this be, if the *proudest* part of mankind are also most addicted to it, unless we suppose vanity and pride to be the same thing? But they certainly are different passions. The proud man despises other men, and derives his chief pleasure from the contemplation of his own importance; the vain man stands in need of the applause of others, and cannot be happy without it. Pride is apt to be reserved and sullen; vanity is often affable, and officiously obliging. The proud man is so confident of his merit, and thinks it so obvious to all the world, that he will scarcely give himself the trouble to inform you of it; the vain man, to raise your admiration, scruples not to tell you, not only the whole truth, but even a great deal more. In the same person, these two passions may, no doubt, be united; but some men are too proud to be vain, and some vain men are too conscious of their own weakness to be proud. Be all this, however, as it will, we have not as yet made any discovery of the cause of laughter; in regard to which, I apprehend, that the vain are not more intemperate than other people; and I am sure that the proud are much less so.

"Hutcheson's account of the origin of laughter is equally unsatisfactory. Granting what he says to be true, I would observe, in the first place, what the ingenious author seems to have been aware of, that there may be a mixture of meanness and dignity where there is nothing ludicrous. A city, considered as a collection of low and lofty houses, is no laughable object. Nor was that person either ludicrous or ridiculous, whom Pope so justly characterizes,

> The greatest, wisest, meanest of mankind.

But, secondly, cases might be mentioned, of laughter arising from a group of ideas or objects, wherein there is no discernible opposition of meanness or dignity. We are told of the dagger of Hudibras, that

> It could scrape trenchers, or chip bread,
> Toast cheese or bacon, though it were
> To bait a mouse trap, 'twou'd not care;
> 'Twou'd make clean shoes, or in the earth
> Set leeks and onions, and so forth.

The humour of the passage cannot arise from the meanness of these offices compared with the dignity of the dagger, nor from any opposition of meanness and dignity in the offices themselves, they being all equally mean; and must therefore be owing to some peculiarity in the description. We laugh when a droll mimics the solemnity of a grave person; here dignity and meanness are indeed united; but we laugh also (though not so heartily perhaps) when he mimics the peculiarities of a fellow as insignificant as himself, and displays no opposition of dignity and meanness. The levities of Sancho Pança, opposed to the solemnity of his master, and compared with his own schemes of preferment, form an entertaining contrast; but some of the vagaries of that renowned squire are truly laughable, even when his preferment and his master are out of the question. Men laugh at puns; the wisest and wittiest of our species have laughed at them; Queen Elizabeth, Cicero, and Shakspeare, laughed at them; clowns and children laugh at them; and most men, at one time or other, are inclined to do the same; but in this sort of low wit, is it an opposition of meanness and dignity that entertains us? Is it not rather a mixture of sameness and diversity; sameness in the sound, and diversity in the signification?

"In the characters mentioned by Akenside, the author does not distinguish between what is *laughable* and what is *contemptible;* so that we have no reason to think that he meant to specify the qualities peculiar to those things which provoke *pure laughter;* and whatever account we may make of his definition, which to those who acquiesce in the foregoing reasonings may appear not quite satisfactory, there is in the poem a passage that deserves particular notice, as it seems to contain a more exact account of the ludicrous quality than is to be found in any of the theories above mentioned. This passage we shall soon have occasion to quote."

Dr Beattie then proceeds to give his own theory concerning the origin of laughter, which he supposes to arise from the view of things incongruous united in the same assemblage. "However imperfect," says he, "the above-mentioned theories may appear, there is none of them destitute of merit; and indeed the most fanciful philosopher seldom frames a theory without consulting nature in some of her more obvious appearances. Laughter very frequently arises from the view of dignity and meanness united in the same object; sometimes, no doubt, from the appearance of assumed inferiority, as well as of small faults and unimportant turpitudes; and sometimes, perhaps, though rarely, from that sort of pride which is described in the passage already quoted from Hobbes.

"All these accounts agree in this, that the cause of laughter is something compounded; or something that disposes the mind to form a comparison, by passing from one object or idea to another. That this is in fact the case, cannot be proved *a priori;* but this holds in all the examples hitherto given, and will be found to hold in all that are given hereafter. May it not then be laid down as a principle, that laughter arises from the view of two or more objects or ideas disposing the mind to form a comparison? According to the theory of Hobbes, this comparison would be between the ludicrous object and ourselves; according to those writers who misapply Aristotle's definition, it would seem to be formed between the ludicrous object and things or persons in general; and if we incline to Hutcheson's theory, which is the best of the three, we shall think that there is a comparison of the parts of the ludicrous object, first with one another, and secondly with ideas or things extraneous.

"Further, every appearance that is made up of parts, or that leads the mind of the beholder to form a comparison, is not ludicrous. The body of a man or woman, of a horse, a fish, or a bird, is not ludicrous, though it consists of many parts; and it may be compared to many other things without raising laughter; but the picture described in the beginning of the epistle to the Pisoes, with a man's head, a horse's neck, feathers of different birds, limbs of different beasts, and the tail of a fish, would have been thought ludicrous 1800 years ago, if we believe Horace, and in certain circumstances would no doubt be so at this day. It would seem, then, that 'the parts of a laughable assemblage must be in some degree unsuitable and heterogeneous.'

"Moreover, any one of the parts of the Horatian monster, a human head, a horse's neck, the tail of a fish, or the plumage of a fowl, is not ludicrous in itself; nor would those several pieces be ludicrous if attended to in succession, without any view to their union. For, to see them disposed on the different shelves of a museum, or even on the same shelf, nobody would laugh, except, perhaps, the thought of uniting them were to occur to his fancy, or the passage of Horace to his memory. It seems to follow, that 'the incongruous parts of a laughable idea or object must either be combined so as to form an assemblage, or must be supposed to be so combined.'

"May we not then conclude, 'that laughter arises from the view of two or more inconsistent, unsuitable, or incongruous parts or circumstances, considered as united in one complex object or assemblage, or as acquiring a sort of mutual relation, from the peculiar manner in which the mind takes notice of them?' The lines from Akenside formerly referred to, seem to point at the same doctrine:

> Where'er the pow'r of ridicule displays
> Her quaint-ey'd visage, *some incongruous form,*
> *Some stubborn dissonance of things combin'd,*
> Strikes on the quick observer.

And to the same purpose, the learned and ingenious Dr Gerard, in his *Essay on Taste*: 'The sense of ridicule is gratified by an inconsistence and dissonance of circumstances in the same object, or in objects nearly related in the main; or by a similitude or a relation unexpected between things on the whole opposite and unlike.'

"And therefore, instead of saying with Hutcheson, that the cause or object of laughter is an 'opposition to dignity and meanness,' I would say, in more general terms, that it is 'an opposition to suitableness or unsuitableness, or of relation and the want of relation, united, or supposed to be united, in the same assemblage.' Thus the offices ascribed to the dagger of Hudibras seem quite heterogeneous; but we discover a bond of connection among them, when we are told that the same weapon could occasionally perform them all. Thus, even in that mimicry which displays no opposition of dignity and meanness, we perceive the actions of one man joined to the features and body of another; that is, a mixture of unsuitableness, or want of relation, arising from the difference of persons, with congruity and similitude, arising from the sameness of the actions. And here let it be observed in general, that the greater number of incongruities that are blended in the same assemblage, the more ludicrous it will probably be. If, as in Butler's resemblance of the morning to a boiled lobster, there is a mixture of dignity and meanness, as well as of likeness and dissimilitude, the effect of the contrast will be more powerful than if only one of these oppositions had occurred in the ludicrous idea. The sublimity of Don Quixote's mind, contrasted and connected with his miserable equipage, forms a very comical exhibition; but when all this is still further connected and contrasted with Sancho Pança, the ridicule is heightened exceedingly. Had the knight of the lions been better mounted and accoutred, he would not have made us smile so often; because, the hero's mind and circumstances being more adequately matched, the whole group would have united fewer inconsistencies, and reconciled fewer incongruities. Butler has combined a still greater variety of uncouth and jarring circumstances in Ralpho and Hudibras; but the picture, though more elaborate, is less natural. Yet this argues no defect of judgment. His design was, to make his hero not only ludicrous, but contemptible; and therefore he jumbles together, in his equipage and person, a number of mean and disgusting qualities, pedantry, ignorance, nastiness, and extreme deformity. But the knight of La Mancha, though a ludicrous, was never intended for a contemptible personage. He often moves our pity, he never forfeits our esteem; and his adventures and sentiments are generally interesting; which could not have been the case if his story had not been natural, and himself been endowed with great as well as good qualities. To have given him such a shape, and such weapons, arguments, boots, and breeches, as Butler has bestowed on his champion, would have destroyed that solemnity which is so striking a feature in Don Quixote; and Hudibras, with the manners and person of the Spanish hero, would not have been that paltry figure which the English poet meant to hold up to the laughter and contempt of his countrymen. Sir Launcelot Greaves is of Don Quixote's kindred, but a different character. Smollett's design was not to expose him to ridicule, but rather to recommend him to our pity and admiration. He has therefore given him youth, strength, and beauty, as well as courage and dignity of mind; has mounted him on a generous steed, and arrayed him in an elegant suit of armour. Yet, that the history might have a comic air, he has been careful to contrast and connect Sir Launcelot with a squire and other associates of very dissimilar tempers and circumstances.

"What has been said of the cause of laughter does not amount to an exact description, far less to a logical definition; there being innumerable combinations of congruity and inconsistency, of relation and contrariety, of likeness and dissimilitude, which are not ludicrous at all. If we could ascertain the peculiarities of these, we should be able to characterize with more accuracy the general nature of ludicrous combination. But before we proceed to this, it would be proper to evince, that of the present theory thus much at least is true, that though every incongruous combination is not ludicrous, every ludicrous combination is incongruous.

"It is only by a detail of facts or examples that any theory of this sort can be either established or overthrown. By such a detail, the foregoing theories have been, or may be, shown to be ill founded, or not sufficiently comprehensive. A single instance of a laughable object, which neither unites, nor is supposed to unite, incongruous ideas, would likewise show the insufficiency of the present; nor will I undertake to prove (for indeed I cannot), that no such instance can be given. A complete enumeration of ludicrous objects it would be in vain to attempt; and therefore we can never hope to ascertain, beyond the possibility of doubt, that common quality which belongs to all ludicrous ideas that are, or have been, or may be, imagined. All that can be done in a case of this kind is to prove, by a variety of examples, that the theory now proposed is more comprehensive, and better founded, than any of the foregoing." This our author afterwards shows at full length; but as the variety of examples adduced by him would take up too much room to be inserted here, and as every reader must be capable of adducing numberless instances of ludicrous cases to himself, we shall content ourselves with the above explanation of the different theories of laughter, referring those who desire further satisfaction to the treatise already quoted.

LAUINGEN, a city of Bavaria, in the circle of the Upper Danube, the capital of a bailiwick of the same name. It is walled, and has 733 houses, with 3530 inhabitants, who make linen and woollen cloths, and have much trade by the Danube, on which it is situated.

LAUNCESTON, a borough town of the hundred of East, in the county of Cornwall, 213 miles from London. It is pleasantly situated on a gentle elevation overlooking the river Tamer. It has good markets, which are held on Wednesday and Saturday. It is one of the county towns, in which the assizes are held in the spring, as they are at Bodmin in the summer. The corporation consists of a mayor, a recorder, and twelve aldermen. The population amounted in 1801 to 1483, in 1811 to 1758, in 1821 to 2183, and in 1831 to 2231. It formerly returned two members to the House of Commons, but by the reform act elects now only one.

LAUNCH, in the sea language, signifies to put out; as, *launch the ship*, that is, put her out of dock; *launch aft*, or *forward*, speaking of things that are stowed in the hold, is, put them more forward. *Launch, ho!* is a term used when a yard is hoisted high enough, and signifies *hoist no more*. See also LANCH.

LAUNDER, in *Mineralogy*, a name given in Devonshire, and other places, to a long and shallow trough, which receives the powdered ore after it comes out of the box or coffer, a sort of mortar, in which it is powdered with iron pestles. The powdered ore, which is washed into the launder by the water from the coffer, is always finest nearest the grate, and coarser all the way down.

LAUPEN, a town of the canton of Berne, in Switzerland, the capital of a bailiwick of the same name, situated at the junction of the rivers Sense and Laane. It is celebrated for the victory gained by the confederated states in 1339, and contains 1230 inhabitants.

LAURA, in *Ecclesiastical History*, a name given to a collection of little cells at some distance from one another, in which the hermits in ancient times lived together in a wilderness or desert place.

These hermits did not live in community, but each monk provided for himself in his own distinct cell. The most celebrated lauras mentioned in ecclesiastical history were in Palestine; as the laura of St Euthymus, four or five leagues distant from Jerusalem; the laura of St Saba, near the brook Kedron; and the laura of the Towers, near the river Jordan.

POET-LAUREATE, an officer of the household of the kings of Britain, whose business consists only in composing an ode annually on his majesty's birth-day, and the new year; and sometimes also, though rarely, on occasion of any remarkable victory. Of the first institution of poets-laureate, Mr Wharton has given an account in his History of English Poetry. "Great confusion," says he, "has entered into this subject, on account of the degrees in grammar, which included rhetoric and versification, anciently taken in our universities, particularly at Oxford, on which occasion a wreath of laurel was presented to the new graduate, who was afterwards usually styled *Poeta Laureatus*. These scholastic laureations, however, seem to have given rise to the appellation in question. I will give some instances at Oxford, which at the same time will explain the nature of the studies for which our academical philologists received their rewards. About the year 1470, one John Watson, a student in grammar, obtained a concession to be graduated and laureated in that science, on condition that he composed one hundred Latin verses in praise of the university, and a Latin comedy. Another grammarian was distinguished with the same badge, after having stipulated that at the next public act he would affix the same number of hexameters on the great gates of St Mary's Church, that they might be seen by the whole university. This was at that period the most convenient mode of publication. About the same time one Maurice Byrchensaw, a scholar in rhetoric, supplicated to be admitted to read lectures, that is, to take a degree in that faculty; and his petition was granted, with a provision that he should write one hundred verses on the glory of the university, and not suffer Ovid's Art of Love, and the Elegies of Pamphilius, to be studied in auditory. Not long afterwards, one John Bulman, another rhetorician, having complied with the terms imposed, of explaining the first book of Tully's Offices, and likewise the first of his Epistles, without any pecuniary emolument, was graduated in rhetoric, and a crown of laurel was publicly placed on his head by the hands of the chancellor of the university. About the year 1489 Skelton was laureated at Oxford, and in the year 1493 was permitted to wear his laurel at Cambridge. Robert Whittington affords the last instance of a rhetorical degree at Oxford. He was a secular priest, and eminent for his various treatises on grammar, and for his facility in Latin poetry. Having exercised his art many years, and submitting to the customary demand of a hundred verses, he was honoured with the laurel in the year 1512.

"With regard to the poet-laureate of the kings of England, he is undoubtedly the same that is styled the *king's versifier*, and to whom 100 shillings were paid as his annual stipend in the year 1251. But when or how that title commenced, and whether this officer was ever solemnly crowned with laurel at his first investiture, I will not pretend to determine, after the searches of the learned Selden on this question have proved unsuccessful. It seems most probable that the barbarous and inglorious name of *versifier* gradually gave way to an appellation of more elegance and dignity; or rather, that at length those only were in general invited to this appointment who had received academical sanction, and had merited a crown of laurel in the universities for their abilities in Latin composition, particularly Latin versification. Thus the *king's laureate* was nothing more than a *graduated* rhetorician employed in the service of the king. That he originally wrote in Latin, appears from the ancient title *versificator;* and may be moreover collected from the two Latin poems which Baston and Gulielmus, who appear to have respectively acted in the capacity of royal poets to Richard I. and Edward II. officially composed on Richard's crusade, and Edward's siege of Striveling Castle.

"Andrew Bernard, successively poet-laureate of Henry VII. and VIII. affords a still stronger proof that this officer was a Latin scholar. He was a native of Thoulouse, and an Augustine monk. He was not only the king's poet-laureate, as it is supposed, but his historiographer, and preceptor in grammar to Prince Arthur. He obtained many ecclesiastical preferments in England. All the pieces now to be found which he wrote in the character of poet-laureate are in Latin. These are, An Address to Henry VIII. for the most auspicious beginning of the tenth year of his reign, with an *Epithalamium* on the marriage of Francis the dauphin of France with the king's daughter; A New Year's Gift for the year 1515; and Verses wishing prosperity to his majesty's thirteenth year. He has left some Latin hymns; and many of his Latin prose pieces, which he wrote in the quality of historiographer to both monarchs, are remaining.

"I am of opinion that it was not customary for the royal laureate to write in English, till the reformation of religion had begun to diminish the veneration for the Latin language; or, rather, till the love of novelty, and a better sense of things, had banished the narrow pedantries of monastic erudition, and taught us to cultivate our native tongue."

LAURENTALIA, or LARENTALIA, called also *Laurentinalia*, *Laurentales*, and *Larentales*, feasts celebrated amongst the Romans on the tenth of the kalends of January, or twenty-third of December, in memory of Acca Laurentia, wife of the shepherd Faustulus, and nurse of Romulus and Remus. Acca Laurentia, from whom the solemnity took its name, is represented as no less remarkable for the beauty of her person than her lasciviousness, on account of which she was nick-named by her neighbours *lupa*, or she-wolf, which is said to have given rise to the tradition of Romulus and Remus being suckled by a she-wolf. She afterwards married a very rich man, who brought her great wealth, which, at her death, she left to the Roman people; in consideration of which they performed these rites in honour of her, though others represent the feast as held in honour of Jupiter Latiaris.

LAURENTIUS, one of the first printers, and, according to some, the inventor of the art, was born at Haerlem, about the year 1370, and filled several offices in the magistracy of that city. Those writers are mistaken who assign to him the surname of *Coster*, or assert that the office of *ædituus* was hereditary in his family. In a diploma of Albert of Bavaria in 1380, in which, amongst other citizens of Haerlem, Laurentius's *father* is mentioned by the name of *Joannes Laurentii filius*, Beroldus, who was surely of another family, is called *ædituus*; and in 1396 and 1398 Henricus a Lunen enjoyed that office, after whose resignation, Count Albert having conferred on the citizens the privilege of electing their *ædituus*, they soon afterwards fixed on Laurentius, who was subsequently called *Coster* from his office, and not from his family name, as he was descended from an illegitimate branch of the Gens Brederodia. His office was very lucrative; and that he was a man of great property is testified by the elegance of his residence. That he was the inventor of printing, is asserted in the narrative of Junius. His first work was an *Horarium*, containing the Letters of the Alphabet, the Lord's Prayer, the Apostles' Creed, and two or three short Prayers; the next was the *Speculum Salutis*, in which he introduced pictures on wooden blocks; then he printed *Donatus*, in the larger size; and afterwards the same work in a less size. All these were printed on separate moveable wooden types, fastened together by threads. If it be thought improbable, that so ingenious a man should have proceeded no farther than the invention of wooden types, it may be answered, that he printed for profit, not for fame; and wooden types were not only at that time made sooner and cheaper than metal could be, but were sufficiently durable for the small impressions of each book he must necessarily have printed. His press was nearly shaped like the common wine-presses. He printed some copies of all his books both on paper and vellum. It has been commonly supposed, though without reason, that he quitted the profession, and died broken hearted; but it is certain, that he did not live to see the art brought to perfection. He died in 1440, aged seventy; and was succeeded either by his son-in-law, Thomas Peter, who married his only daughter Lucia; or by their immediate descendants, Peter, Andrew, and Thomas, who were old enough to conduct the business, the eldest being at least twenty-two or twenty-three years of age. What books they printed it is not easy to determine, since, after the example of Laurentius, they added to their books, neither their names, nor the place where they were printed, nor the date of the year. Their first essays were new editions of *Donatus* and the *Speculum*. They afterwards reprinted the latter, with a Latin translation, in which they used their grandfather's wooden pictures, and printed the book partly on wooden blocks, partly on wooden separate types, according to Mr Meerman, who has given an exact engraving of each sort, taken from different parts of the same book, which was published between the years 1442 and 1450. Nor did they stop here. They continued to print several editions of the *Speculum*, both in Latin and in Dutch; and many other works, particularly *Historia Alexandri Magni; Flavii Vedatii* [for *Vegetii*] *Renati Epitome de Re Militari*; and *Opera varia a Thomas Kempis*. Of these Mr Meerman has given an engraved specimen. They were all printed with separate wooden types, and, by their great neatness, are a proof that the descendants of Laurentius were industrious in improving his invention. Kempis was printed at Haerlem in 1472, and was the last known work of Laurentius's descendants, who soon afterwards disposed of all their materials, and probably quitted the employment; the use of fusil types having about that time been universally diffused throughout Holland by the settling of Martens at Alost, where he pursued the art with reputation for upwards of sixty years. See PRINTING.

LAURENTIUM, or LAURENS CASTRA, in *Ancient Geography*, a town of Latium, supposed to have been the royal residence of those most ancient kings Latinus, Picus, and Faunus. Hither the Emperor Commodus retired during a pestilence. Its name was derived from an adjoining grove of bay trees, midway between Ostia and Antium, and it is supposed to have stood in the place now called *San Lorenzo*, which seems to be confirmed from the Via Laurentina leading to Rome.

LAURO, PHILIPPO, a celebrated painter, was born at Rome in 1623. He learned the first rudiments of the art from his father Balthasar, who was himself a good painter; but he afterwards studied under Angelo Carosello, his brother-in-law, and proved so great a proficient, that in a short time he far surpassed his tutors in design, colouring, and elegance of taste. He applied himself to painting historical subjects in a small size, enriching the backgrounds with lively landscapes, that afforded the eye and the judgment equal gratification; but though his small paintings are most approved, he finished several grand compositions for altar-pieces which were highly esteemed. He died in 1694; and his works are eagerly bought up at high prices all over Europe.

LAUSANNE, a city, the capital of the canton of Vaud, in Switzerland, in the circle of the same name. It is built on five hills, near the lake of Geneva. The situation is fine, though it is an irregularly built place. There is a fine Gothic cathedral, a council-house, a hospital, and some other public buildings, with 1060 dwelling-houses, and 10,200 inhabitants. The situation is healthy, though cold in winter, from its elevation being 1570 feet above the level of the sea. There is a college with fourteen professors, and a good library. A few manufactures are carried on, chiefly for articles of luxury or ornament. Some good wine is grown near the city. Long. 6. 40. 10. E. Lat. 46. 31. 5. N.

LAUSATIA, one of the circles into which the present kingdom of Saxony is divided. It touches on the south the Austrian kingdom of Bohemia, and on the north and the east the Prussian provinces of Brandenburg and of Silesia. It is extended over 1650 square miles, comprehends sixteen cities and towns, 458 villages, and 336,500 inhabitants, of whom one fifth are of the ancient race of Wenden or Vandals, and still retain their primitive language and manners. The northern portion of the circle is mountainous, but the southern division is more level, and is fertile and well cultivated. The chief city is Bautzen.

LAUTERBACH, a town of Hesse-Darmstadt, in the canton of Upper Hesse. It is the capital of the bailiwick of its name, is situated on the river Altfell, is walled, and contains 538 houses, with 3050 inhabitants, who are employed in linen and woollen manufactures, and in tanneries.

LAVA, a stream of melted minerals, which runs out of the mouths, or bursts out through the sides, of burning mountains, during the time of an eruption. See ÆTNA and VESUVIUS, also VOLCANO.

LAVAL, an arrondissement of the department of the Mayenne, in France, extending over 715 square miles. It is divided into nine cantons and ninety-three communes, and contains a population of 108,600 persons. The chief place is the city of the same name, which is also the capital of the department. It is finely situated on both sides of the Mayenne, but is ill built, with narrow and crooked streets and antique houses, and only agreeable from the walks that surround it. It contains 3520 houses, with 15,500 inhabitants, who are chiefly employed in making linens, which, under the name *toiles de Laval*, have great celebrity throughout the kingdom. There are also some serges and thin stuffs of worsted made. Long. 0. 52. W. Lat. 48. 4. N.

LAVATER, JOHN GASPARD CHRISTIAN, best known by his writings on physiognomy, was born at Zurich, in Switzerland, in 1741. He was brought up a protestant minister, and entered into holy orders in 1761. He was for some time pastor of the orphans' church in that city; but from the year 1778 he was deacon and pastor of St Peter's church in the same place. The eloquence of his discourses in the pulpit, as well as the ardent zeal and Christian benevolence with which he discharged the duties of his office, procured for him an early reputation. Though not much conversant with books, he had a very extensive knowledge of human nature, and a most acute discernment. His theological writings in prose and verse are little known, but his works on physiognomy have extended his fame throughout every part of Europe. We are informed by himself, that he felt an early propensity to study the human face, and frequently drew such features as made a peculiar impression upon his mind; but his choice of physiognomy was fixed by the suggestion of Dr Zimmerman, who, having heard his remarks on the singular countenance of a soldier whom they saw passing by as they stood together at a window, urged him to pursue and methodise his ideas. He soon acquired a full conviction of the reality of physiognomical science, and of his own discoveries in it. His first volume on this subject appeared at Leipzig in 1776, and the twenty sections of which it was composed he modestly denominated fragments. With him it appeared to be an axiom, that the powers and faculties of the mind have representative signs in the solid parts of the countenance. This notion he extended to all animated nature, firmly believing that internal qualities invariably denote themselves by external marks or tokens.

Two more volumes soon appeared in succession, containing a wonderful assemblage of curious observations, refined reasoning, delicate feeling, and philanthropic sentiments, with a number of engravings highly finished and singularly expressive. This work was well translated into the French and English languages, and for some time formed the favourite topic of literary discussion. So much was its author admired, that no foreigner of distinction passed through Zurich without obtaining an interview with Lavater, and asking his opinion of some character from a shade or miniature. His huge volumes, however, are now seldom looked at except for the sake of the plates, and his physiognomical notions appear to be consigned to oblivion with other sciences of a chimerical nature. One of the best known of his miscellaneous publications is his Aphorisms on Man, which contain originality both in sentiment and expression, with deep and philosophical views of human nature.

Lavater was zealously attached to the Christian revelation, and translated Bonnet's Inquiry into the Evidences of Christianity, into the German language. This book he dedicated to the celebrated Jewish philosopher Moses Mendelsohn, with a challenge either to refute it publicly, or profess his conviction of the truth of its arguments. This challenge he afterwards confessed to have been inconsiderate, and allowed that his zeal had misled him. His popularity at Zurich was so extremely great, that in his walks it was no uncommon thing to see the people flocking around him, and kissing his hand in token of respect. He had a most exemplary moral character, and his zeal in doing good was scarcely ever surpassed. He was mild and moderate in conversation, although naturally full of fire and sensibility; he was candid in his estimate of such as differed from him in opinion; he always rose early, and never took his breakfast till he thought he had earned it. He was the determined enemy of tyranny in every shape, being possessed of the genuine Swiss zeal for liberty. He was therefore a friend to the French revolution at its commencement; but the rapine, plunder, and bloodshed which afterwards disgraced it, made him one of its bitterest adversaries. On the day when the unfortunate city of Zurich was stormed by Massena in 1799, he received a wound in the breast from a Swiss soldier in the streets, to whom he had formerly been a benefactor. He never wholly recovered from the effects of this wound; and he brought on a train of dangerous symptoms by attending for more than an hour, in the open air, a man who was condemned to be shot as a spy. The activity and vigour of his mind, however, continued till a short time before his death, which took place on the 2d of January 1801.

LAVATORY, or LAVADERO, a name given to certain places in Chili and Peru, where gold is obtained from earth by washing.

LAVAUR, an arrondissement of the department of the Tarn, in France, 316 square miles in extent. It consists of five cantons, divided into sixty-one communes, and contains 47,800 inhabitants. The capital is the city of the same name, situated on the left bank of the river Agout. It contains 850 houses, and 6600 inhabitants employed in making silk goods. Long. 1. 47. E. Lat. 43. 42. N.

LAVENHAM, a town of the hundred of Baberg, in the county of Suffolk, sixty-two miles from London. It is governed by a corporation of six capital burgesses, chosen for life. It had once a cloth manufactory, which has disappeared, and now only carries on some trade in hempen goods. The population amounted in 1801 to 1776, in 1811 to 1711, in 1821 to 1898, and in 1831 to 2107.

LAVER, in scripture history, a sacred utensil placed in the court of the Jewish tabernacle, consisting of a bason, whence water was drawn by cocks, for washing the hands and feet of the officiating priests, and also the entrails and legs of the victims.

LAVERNA, in *Antiquity*, the goddess of thieves and cheats amongst the Romans, who honoured her with public worship, because she was supposed to favour those who wished that their designs might not be discovered. Varro says that she had an altar near one of the gates of Rome, which was hence called *porta lavernalis*.

LAVINIUM, in *Ancient Geography*, a town of Latium, six miles to the east of Laurentum, according to an ancient map; so named from *Lavinia*, consort of Æneas, and daughter of King Latinus, and built by the Trojans.

LAVOISIER, ANTOINE LAURENT, the celebrated discoverer of the new chemical theory, was born at Paris in the month of August 1745. His father being a man of opulence acquired in commerce, spared no cost on the education of his son. The latter studied at Mazarin College, and obtained a great number of prizes in his classes; but he soon evinced a decided taste for the sciences, which his father had the good sense to encourage. On leaving college, he applied himself to the study of mathematics and astronomy in the observatory of Lacaille, to that of chemistry in the laboratory of Rouelle, and to that of botany under Bernard de Jussieu, whom he attended in his herborisations. His passion for study was such, that he put himself on a milk diet, and denied himself the pleasures of general society, living only with his masters and fellow-students, all of whom remained his friends throughout life. An extraordinary premium having been offered by the French government in the year 1764, for the best and most economical method of lighting the streets of an extensive city, Lavoisier, although at that time only twenty-one years of age, gained the gold medal; and his excellent memoir was published by the academy, of which he became a member on the 13th of May 1768. His attention was successively occupied with the pretended conversion of water into earth, the analysis of the gypsum found in the vicinity of Paris, the congelation of water, the phenomena of thunder, and the aurora borealis.

By undertaking journeys with Guettard into every province of France, he was enabled to procure an immense variety of materials for a description of the mineral kingdom, and serving also as the foundation of a great work on the revolutions of the globe, two admirable sketches of which are to be seen in the Memoirs of the French Academy for 1772 and 1787. His whole time and fortune were dedicated to the cultivation of the sciences, nor did he seem more attached to one than to another, till an interesting event decided his choice in favour of chemistry. The discovery of gases, just made known to the learned world by Black, Priestley, Scheele, Cavendish, and Macbride, appeared to him like a new creation.

Lavoisier was so struck with the grandeur and importance of the discovery, that he turned all his attention to this fountain of truths, perceiving the powerful influence which this new science would exert over all physical researches. He was inspired with the true spirit of inductive philosophy, and all his experiments had a direct reference to general views. In the year 1773, he presented to the academy, and published, his *Opuscules Physiques et Chimiques*, containing a history of whatever had been done before respecting the gases, and concluding with his own grand and interesting experiments. He demonstrated that metals, in calcination, derive their increased weight from the absorption of highly-respirable air, of which he afterwards proved that nitrous acid is composed. His chemical ingenuity was now so well known, that Turgot employed him in 1776 to inspect the manufacture of gunpowder, which he greatly improved in strength, or explosive force. In the year 1778 he discovered that all acids contain the respirable portion of the atmosphere as a constituent principle, and to this he gave the name of oxygen. This was the first grand step towards the new chemistry, which was fully completed by his confirming the discovery of the composition of water, ascertained in 1783.

His Elements of Chemistry, in two vols. 8vo, were published in 1789, and form a beautiful model of scientific composition, being at once clear, logical, and elegant. In a very few years his system was almost universally adopted, so complete was the conviction it carried along with it to every candid and reflecting mind. The last of Lavoisier's philosophical works was on the respiration and transpiration of animals, first read to the academy on the 4th of May 1791. By a number of the nicest experiments, he found that a man in one day perspires forty-five ounces; that he consumes thirty-three ounces of vital air or oxygen; that eight cubic feet of carbonic acid gas are discharged from his lungs; that the weight of water discharged from the lungs is twenty-three ounces, composed of three of hydrogen and twenty of oxygen; which interesting discoveries he directed to the improvement of medicine.

There are no fewer than forty memoirs of Lavoisier in the volumes of the Academy of Sciences from 1772 to 1793, all relating to the grand phenomena of the science; such as the analysis of atmospherical air, the formation of elastic fluids, the properties of the matter of heat, the composition of acids, the decomposition of water, &c. To the sciences, arts, and manufactures, he rendered the most essential services, both in a public and in a private capacity. He succeeded Buffon and Tillet as treasurer to the academy, into the accounts of which he introduced both economy and order. He was consulted by the National Convention as to the most eligible means of improving the manufacture of assignats, and of augmenting the difficulties of forging them. He turned his attention also to political economy, and, between the years 1778 and 1785, he allotted 240 *arpents* in the Vendomois for experimental agriculture, and increased the ordinary produce by one half. In 1791, the Constituent Assembly invited him to draw up a plan for rendering more simple the collection of the taxes; which produced an excellent report, printed under the title of Territorial Riches of France.

Whilst the horrors of Robespierre's usurpation continued, he used to observe to Lalande that he foresaw he would be deprived of all his property, but that he was extremely willing to work for his subsistence; and it is supposed that he meant to pursue the profession of apothecary, as most congenial to his studies. But the unrelenting tyrant had already fixed his doom. He was thrown into prison, whence he was soon dragged to the scaffold, where he perished, with twenty-eight farmers-general, on the 8th of May 1794, for no other crime but because he was opulent, and belonged to that body. A report, drawn up by M. Hallé, a courageous citizen, containing a description of the works, and a recapitulation of the discoveries, of Lavoisier, sufficient to make an impression upon the most obdurate heart, was presented to the revolutionary tribunal. Even Lavoisier himself deigned to ask of the miscreants who had condemned him, a delay for a few days, that he might have time to complete some experiments interesting to humanity; alluding probably to his researches on transpiration, which had been suspended by his imprisonment. But all was in vain. The president of that horrible tribunal told him, in a ferocious tone, that they had no longer any need of learned men; and his head fell under the axe of the guillotine, in the fifty-first year of his age.

Lavoisier was tall, and possessed a countenance full of benignant expression. His character was mild, humane, social, obliging; and he discovered an incredible degree of activity. He had great influence, on account of his credit, fortune, reputation, and his office in the treasury; but all the use he made of it was to do good; yet this did not prevent jealousy on the part of others. In 1771 he married Marie-Anne-Pierette-Paulze, the daughter of a farmer-general, whose excellent accomplishments formed the delight of his life, who assisted him in his labours, and even drew the figures for his last work. This lady had the misfortune to behold her father, her husband, and her most intimate friends, assassinated in one day; and she was herself imprisoned, nay, even menaced with a similar fate; but the unshaken fortitude of her mind enabled her to rise superior to the horrors of her condition. Lavoisier died childless.

Definition.

LAW (says Blackstone, from whose work the following observations are abridged), in its most general and comprehensive sense, signifies a rule of action; and is applied indiscriminately to all kinds of action, whether animate or inanimate, rational or irrational. Thus we say, the laws of motion, of gravitation, of optics, of mechanics, as well as the laws of nature and of nations. And it is that rule of action which is prescribed by some superior, and which the inferior is bound to obey.

Thus, when the Supreme Being formed the universe, and created matter out of nothing, he impressed certain principles upon that matter, from which it can never depart, and without which it would cease to be. When he put that matter into motion, he established certain laws of motion, to which all moveable bodies must conform. And, to descend from the greatest operations to the smallest, when a workman forms a clock or other piece of mechanism, he establishes at his own pleasure certain arbitrary laws for its direction, as, that the hand shall describe a given space in a given time; to which law as long as the work conforms, so long it continues in perfection, and answers the end of its formation.

If we advance farther, from mere inactive matter to vegetable and animal life, we shall find them still governed by laws, more numerous indeed, but equally fixed and invariable. The whole progress of plants, from the seed to the root, and from thence to the seed again; the method of animal nutrition, digestion, secretion, and all other branches of vital economy; are not left to chance, or the will of the creature itself, but are performed in a wondrous involuntary manner, and guided by unerring rules laid down by the great Creator.

This, then, is the general signification of law, a rule of action dictated by some superior being. And, in those creatures that have neither the power to think nor to will, such laws must be invariably obeyed, so long as the creature itself subsists; for its existence depends on that obedience. But laws, in their more confined sense, and in which it is our present business to consider them, denote the rules, not of action in general, but of *human* action or conduct; that is, the precepts by which man, the noblest of all sublunary beings, a creature endowed with both reason and free will, is commanded to make use of those faculties in the general regulation of his behaviour.

Man, considered as a creature, must necessarily be subject to the laws of his Creator, for he is entirely a dependent being. A being independent of any other has no rule to pursue but such as he prescribes to himself; but a state of dependence will inevitably oblige the inferior to take the will of him on whom he depends as the rule of his conduct, not indeed in every particular, but in all those points wherein his dependence consists. This principle, therefore, has more or less extent and effect, in proportion as the superiority of the one and the dependence of the other is greater or less absolute or limited. And consequently, as man depends absolutely upon his Maker for every thing, it is necessary that he should in all points conform to his Maker's will.

This will of his Maker is called the *law of nature.* For as God, when he created matter, and endued it with a principle of mobility, established certain rules for the perpetual direction of that motion; so, when he created man, and endued him with free will to conduct himself in all parts of life, he laid down certain immutable laws of human nature, whereby that free will is in some degree regulated and restrained, and gave him also the faculty of reason to discover the purport of those laws.

Considering the Creator only as a being of infinite power, he was able unquestionably to have prescribed whatever laws he pleased to his creature man, however unjust or severe. But as he is also a Being of infinite wisdom, he has laid down only such laws as were founded in those relations of justice that existed in the nature of things antecedent to any positive precept. These are the eternal immutable laws of good and evil, to which the Creator himself in all his dispensations conforms, and which he has enabled human reason to discover, so far as they are necessary for the conduct of human actions. Such, among others, is the principle, that we should live honestly, hurt nobody, and render to every one his due; to which three general precepts Justinian has reduced the whole doctrine of law.

But if the discovery of these first principles of the law of nature depended only upon the due exertion of right reason, and could not otherwise be obtained than by a chain of metaphysical disquisitions, mankind would have wanted some inducement to have quickened their inquiries, and the greater part of the world would have rested content in mental indolence, and ignorance, its inseparable companion. As therefore the Creator is a being not only of infinite power and wisdom, but also of infinite goodness, he has been pleased so to contrive the constitution and frame of humanity, that we should want no other prompter to inquire after and pursue the rule of right, but only our own self-love, that universal principle of action. For he has so intimately connected, so inseparably interwoven, the laws of eternal justice with the happiness of each individual, that the latter cannot be attained but by observing the former; and if the former be punctually obeyed, it cannot but induce the latter. In consequence of which mutual connection of justice and human felicity, he has not perplexed the law of nature with a multitude of abstracted rules and precepts, referring merely to the fitness or unfitness of things, as some have vainly surmised; but has graciously reduced the rule of obedience to this one paternal precept, " that man should pursue his own happiness." This is the foundation of what we call *ethics*, or *natural law;* for the several articles into which it is branched in our systems amount to no more than demonstrating that this or that action tends to man's real happiness, and therefore very justly concluding, that the performance of it is a part of the law of nature; or, on the other hand, that this or that action is destructive of man's real happiness, and therefore that the law of nature forbids it.

This law of nature, being coeval with mankind, and dictated by God himself, is of course superior in obligation to any other. It is binding over all the globe, in all countries, and at all times: no human laws are of any validity if contrary to this, and such of them as are valid derive all their force, and all their authority, mediately or immediately, from this original.

But in order to apply this to the particular exigencies of each individual, it is still necessary to have recourse to reason; whose office it is to discover, as was before observed, what the law of nature directs in every circumstance of life, by considering what method will tend the most effectually to our own substantial happiness. And if our reason were always, as in our first ancestor before his transgression, clear and perfect, unruffled by passions, unclouded by prejudice, unimpaired by disease or intemperance, the task would be pleasant and easy; we should need no other guide but this. But every man now finds the contrary in his own experience; that his reason is corrupt, and his understanding full of ignorance and error.

Law of revelation.

This has given manifold occasion for the benign interposition of Divine Providence; which, in compassion to the frailty, the imperfection, and the blindness of human reason, hath been pleased, at sundry times and in divers manners, to discover and enforce its laws by an immediate and direct revelation. The doctrines thus delivered we call the *revealed* or *divine law*, and they are to be found only in the Holy Scriptures. These precepts, when revealed, are found upon comparison to be really a part of the original law of nature, as they tend in all their consequences to man's felicity. But we are not from thence to conclude, that the knowledge of these truths was attainable by reason in its present corrupted state; since we find that, until they were revealed, they were hid from the wisdom of ages. As then the moral precepts of this law are indeed of the same original with those of the law of nature, so their intrinsic obligation is of equal strength and perpetuity. Yet undoubtedly the revealed law is of infinitely more authenticity than that moral system which is framed by ethical writers, and denominated the *natural law:* because the one is the law of nature, expressly declared so to be by God himself; the other is only what, by the assistance of human reason, we imagine to be that law. If we could be as certain of the latter as we are of the former, both would have an equal authority; but till then they can never be put in any competition together.

Upon these two foundations, the law of nature and the law of revelation, depend all human laws; that is to say, no human laws should be suffered to contradict these. There are, it is true, a great number of indifferent points, in which both the divine law and the natural leave a man

Law.

at his own liberty, but which are found necessary, for the benefit of society, to be restrained within certain limits. And herein it is that human laws have their greatest force and efficacy; for, with regard to such points as are not indifferent, human laws are only declaratory of, and act in subordination to, the former. To instance in the case of murder: This is expressly forbidden by the divine, and demonstrably by the natural law; and from these prohibitions arises the true unlawfulness of this crime. Those human laws that annex a punishment to it do not at all increase its moral guilt, or superadd any fresh obligation in *foro conscientiæ* to abstain from its perpetration. Nay, if any human law should allow or enjoin us to commit it, we are bound to transgress that human law, or else we must offend both the natural and the divine. But, with regard to matters that are in themselves indifferent, and are not commanded or forbidden by those superior laws; such, for instance, as exporting of wool into foreign countries; here the inferior legislature has scope and opportunity to interpose, and to make that action unlawful which before was not so.

Law of nations.

If man were to live in a state of nature, unconnected with other individuals, there would be no occasion for any other laws than the law of nature and the law of God. Neither could any other law possibly exist; for a law always supposes some superior who is to make it; and in a state of nature we are all equal, without any other superior but him who is the Author of our being. But man was formed for society; and, as is demonstrated by the writers on this subject, is neither capable of living alone, nor indeed has the courage to do it. However, as it is impossible for the whole race of mankind to be united in one great society, they must necessarily divide into many, and form separate states, commonwealths, and nations, entirely independent of each other, and yet liable to a mutual intercourse. Hence arises a third kind of law to regulate this mutual intercourse, called *the law of nations;* which, as none of these states will acknowledge a superiority in the other, cannot be dictated by either, but depends entirely upon the rules of natural law, or upon mutual compacts, treaties, leagues, and agreements, between these several communities; in the construction also of which compacts we have no other rule to resort to but the law of nature, being the only one to which both communities are equally subject; and therefore the civil law very justly observes, that *quod naturalis ratio inter omnes homines constituit, vocatur jus gentium.* See the article on the LAW OF NATIONS.

Municipal or civil law.

To the consideration, then, of the law of nature, the revealed law, and the law of nations, succeeds that of the municipal or civil law; that is, the rule by which particular districts, communities, or nations, are governed; being thus defined by Justinian, "*jus civile est quod quisque sibi populus constituit.*" We call it *municipal* law, in compliance with common speech; for though, strictly, that expression denotes the particular customs of one single *municipium* or free town, yet it may with sufficient propriety be applied to any one state or nation which is governed by the same laws and customs. Municipal law, thus understood, is properly defined to be "a rule of civil conduct prescribed by the supreme power in a state, commanding what is right, and prohibiting what is wrong." Let us endeavour to explain its several properties, as they arise out of this definition.

And, first, it is a *rule;* not a transient sudden order from a superior to or concerning a particular person; but something permanent, uniform, and universal. Therefore a particular act of the legislature to confiscate the goods of Titius, or to attaint him of high treason, does not enter into the idea of a municipal law; for the operation of this act is spent upon Titius only, and has no relation to the community in general; it is rather a sentence than a law. But an act to declare that the crime of which Titius is accused shall be deemed high treason; this has permanency, uniformity, and universality, and therefore is properly a *rule.* It is also called a *rule,* to distinguish it from *advice* or *counsel,* which we are at liberty to follow or not as we see proper, and to judge upon the reasonableness or unreasonableness of the thing advised; whereas our obedience to the law depends not upon *our approbation,* but upon the *maker's will.* Counsel is only matter of persuasion, law is matter of injunction; counsel acts only upon the willing, law upon the unwilling also.

Law.

It is also called a *rule,* to distinguish it from a *compact* or *agreement;* for a compact is a promise proceeding from us, law is a command directed to us. The language of a compact is, "I will, or will not, do this;" that of a law is, "Thou shalt, or shalt not, do it." It is true there is an obligation which a compact carries with it, equal in point of conscience to that of a law; but then the original of the obligation is different. In compacts, we ourselves determine and promise what shall be done, before we are obliged to do it; in laws, we are obliged to act without ourselves determining or promising any thing at all. Upon these accounts law is defined to be "a rule."

Municipal law is also "a rule of *civil conduct.*" This distinguishes municipal law from the natural or revealed; the former of which is the rule of moral conduct; and the latter not only the rule of moral conduct, but also of faith. These regard man as a creature, and point out his duty to God, to himself, and to his neighbour, considered in the light of an individual. But municipal or civil law regards him also as a citizen, and bound to other duties towards his neighbour than those of mere nature and religion; duties which he has engaged in by enjoying the benefits of the common union, and which amount to no more than that he do contribute, on his part, to the subsistence and peace of the society.

It is likewise "a rule *prescribed;*" because a bare resolution, confined in the breast of the legislator, without manifesting itself by some external sign, can never be properly a law. It is requisite that this resolution be notified to the people who are to obey it. But the manner in which this notification is to be made is matter of very great indifference. It may be notified by universal tradition and long practice, which supposes a previous publication, and is the case of the common law of England and of Scotland. It may be notified *viva voce,* by officers appointed for that purpose, as is done with regard to proclamations, and such acts of parliament as are appointed to be publicly read in churches and other assemblies. It may, lastly, be notified by writing, printing, or the like; which is the general course taken with all our acts of parliament. Yet, whatever way is made use of, it is incumbent on the promulgators to do it in the most public and perspicuous manner; not like Caligula, who (according to Dio Cassius) wrote his laws in a very small character, and hung them up upon high pillars, the more effectually to ensnare the people. There is still a more unreasonable method than this, which is called making of laws *ex post facto;* when, after an action (indifferent in itself) is committed, the legislator then for the first time declares it to have been a crime, and inflicts a punishment upon the person who has committed it. Here it is impossible that the party could foresee that an action, innocent when it was done, should be afterwards converted to guilt by a subsequent law: he had therefore no cause to abstain from it; and all punishment for not abstaining must of consequence be cruel and unjust. All laws should be therefore made to commence *in futuro,* and be notified before their commencement; which is implied in the term "prescribed." But when this rule is in the usual manner notified or prescribed, it is then the subject's

La

business to be thoroughly acquainted therewith; for if ignorance of what he might know were admitted as a legitimate excuse, the laws would be of no effect, but might always be eluded with impunity.

But further, municipal law is "a rule of civil conduct prescribed *by the supreme power in a state;*" for legislature, as was before observed, is the greatest act of superiority that can be exercised by one being over another. Wherefore it is requisite to the very essence of a law, that it be made by the supreme power. Sovereignty and legislature are indeed controvertible terms; one cannot subsist without the other.

This will naturally lead us into a short inquiry concerning the nature of society and civil government; and the natural inherent right that belongs to the sovereignty of a state, wherever that sovereignty be lodged, of making and enforcing laws.

From what has been advanced, the truth of the former branch of our definition is, we trust, sufficiently evident; that "municipal law is a rule of civil conduct, prescribed *by the supreme power in a state.*" We proceed now to the latter branch of it; that it is a rule so prescribed, "commanding what is right, and prohibiting what is wrong."

Now, in order to do this completely, it is first of all necessary that the boundaries of right and wrong be established and ascertained by law. And when this is once done, it will follow of course, that it is likewise the business of the law, considered as a rule of civil conduct, to enforce these rights, and to restrain or redress these wrongs. It remains therefore only to consider, in what manner the law is said to ascertain the boundaries of right and wrong, and the methods which it takes to command the one and prohibit the other.

For this purpose, every law may be said to consist of several parts: one, declaratory, whereby the rights to be observed, and the wrongs to be eschewed, are clearly defined and laid down; another, directory, whereby the subject is intrusted and enjoined to observe those rights, and to abstain from the commission of those wrongs; a third, remedial, whereby a method is pointed out to recover a man's private rights, or redress his private wrongs: to which may be added a fourth, usually termed the *sanction* or *vindicatory* branch of the law, whereby it is signified what evil or penalty shall be incurred by such as commit any public wrongs, and transgress or neglect their duty.

Decla- ory rt f th aw.

With regard to the first of these, the *declaratory* part of the municipal law, this depends not so much upon the law of revelation or of nature, as upon the wisdom and will of the legislator. This doctrine, which before was slightly touched, deserves a more particular explication. Those rights, then, which God and nature have established, and are therefore called *natural rights,* such as are life and liberty, need not the aid of human laws to be more effectually invested in every man than they are; neither do they receive any additional strength when declared by the municipal laws to be inviolable. On the contrary, no human legislature has power to abridge or destroy them, unless the owner shall himself commit some act that amounts to a forfeiture. Neither do divine or natural *duties* (such as, for instance, the worship of God, the maintenance of children, and the like) receive any stronger sanction from being also declared to be duties by the law of the land. The case is the same as to crimes and misdemeanors, that are forbidden by the superior laws, and therefore styled *mala in se,* such as murder, theft, and perjury; which contract no additional turpitude from being declared unlawful by the inferior legislature. For that legislature in all these cases acts only, as was before observed, in subordination to the Great Lawgiver, transcribing and publishing his precepts. So that, upon the whole, the declaratory part of the municipal law has no force or operation at all, with regard to actions that are naturally and intrinsically right or wrong.

Law.

But with regard to things in themselves indifferent, the case is entirely altered. These become either right or wrong, just or unjust, duties or misdemeanors, according as the municipal legislator sees proper for promoting the welfare of the society, and more effectually carrying on the purposes of civil life. Thus our own common law has declared, that the goods of the wife do instantly upon marriage become the property and right of the husband; and our statute law has declared all monopolies a public offence; yet that right and this offence have no foundation in nature, but are merely created by the law, for the purposes of civil society. And sometimes, where the thing itself has its rise from the law of nature, the particular circumstances and mode of doing it become right or wrong, as the laws of the land shall direct. Thus, for instance, in civil duties, obedience to superiors is the doctrine of revealed as well as natural religion; but who those superiors shall be, and in what circumstances, or to what degrees, they shall be obeyed, is the province of human laws to determine. And so, as to injuries or crimes, it must be left to our own legislature to decide in what cases the seizing another's cattle shall amount to the crime of robbery; and where it shall be a justifiable action, as when a landlord takes them by way of distress for rent.

Directory part.

Thus much for the declaratory part of the municipal law. The *directory* stands much upon the same footing; for this virtually includes the former, the declaration being usually collected from the direction. The law that says, "thou shalt not steal," implies a declaration that stealing is a crime. And we have seen, that, in things naturally indifferent, the very essence of right and wrong depends upon the direction of the laws to do or to omit them.

Remedial part.

The *remedial* part of a law is so necessary a consequence of the two former, that laws must be very vague and imperfect without it. For in vain would rights be declared, in vain directed to be observed, if there were no method of recovering and asserting those rights when wrongfully withheld or invaded. This is what we mean properly when we speak of the protection of the law. When, for instance, the declaratory part of the law has said that "the field or inheritance which belonged to Titius's father is vested by his death in Titius," and the directory part has "forbidden any one to enter on another's property without the leave of the owner;" if Gaius after this will presume to take possession of the land, the remedial part of the law will then interpose its office, will make Gaius restore the possession of Titius, and also pay him damages for the invasion.

With regard to the sanction of laws, or the evil that may attend the breach of public duties, it is observed, that human legislators have for the most part chosen to make the sanction of their laws rather vindicatory than remuneratory, or to consist rather in punishments than in actual particular rewards; because, in the first place, the quiet enjoyment and protection of all our civil rights and liberties, which are the sure and general consequence of obedience to the municipal law, are in themselves the best and most valuable of all rewards; because also, were the exercise of every virtue to be enforced by the proposal of particular rewards, it were impossible for any state to furnish stock enough for so profuse a bounty; and farther, because the dread of evil is a much more forcible principle of human actions than the prospect of good. For which reasons, though a prudent bestowing of rewards is sometimes of exquisite use, yet we find that those civil laws, which enforce and enjoin our duty, do seldom, if ever, propose any privilege or gift to such as obey the law, but do constantly come armed with a penalty denounced against transgressors, either expressly defining the nature and quantity of the punishment, or else leaving it to the discretion of the judges, and those who are intrusted with the care of putting the laws in execution.

Vindicatory part.

Of all the parts of a law, the most effectual is the *vindicatory;* for it is but lost labour to say, "Do this, or avoid that," unless we also declare, "This shall be the consequence of your non-compliance." We must therefore observe, that the main strength and force of a law consists in the penalty annexed to it. Herein is to be found the principal obligation of human laws.

Legislators and their laws are said to *compel* and *oblige:* not that, by any natural violence, they so constrain a man as to render it impossible for him to act otherwise than as they direct, which is the strict sense of obligation; but because, by declaring and exhibiting a penalty against offenders, they bring it to pass, that no man can easily choose to transgress the law; since, by reason of the impending correction, compliance is in a high degree preferable to disobedience. And, even where rewards are proposed as well as punishments threatened, the obligation of the law seems chiefly to consist in the penalty: for rewards, in their nature, can only persuade and allure; nothing is compulsory but punishment.

It has been held true, and very justly, by the principal of our ethical writers, that human laws are binding upon men's consciences. But, if that were the only or most forcible obligation, the good only would regard the laws, and the bad would set them at defiance. And, true as this principle is, it must still be understood with some restriction. It holds, we apprehend, as to *rights;* and that, when the law has determined the field to belong to Titius, it is a matter of conscience no longer to withhold or to invade it. So also in regard to *natural duties,* and such offences as are *mala in se.* Here we are bound in conscience, because we are bound by superior laws, before those human laws were in being, to perform the one and abstain from the other. But in relation to those laws which enjoin only positive duties, and forbid only such things as are not *mala in se,* but *mala prohibita* merely, without any intermixture of moral guilt, annexing a penalty to non-compliance; here conscience seems to be no farther concerned, than by directing a submission to the penalty, in case of our breach of those laws: for otherwise the multitude of penal laws in a state would not only be looked upon as an impolitic, but would also be a very wicked thing, if every such law were a snare for the conscience of the subject. But in these cases the alternative is offered to every man; "either abstain from this, or submit to such a penalty;" and his conscience will be clear, whichever side of the alternative he thinks proper to embrace. Thus, by the statutes for preserving the game, a penalty is denounced against every unqualified person that kills a hare, and against every person who possesses a partridge in August. And so too, by other statutes, pecuniary penalties are inflicted for exercising trades without serving an apprenticeship thereto, for erecting cottages without annexing four acres of land to each, for not burying the dead in woollen, for not performing statute work on the public roads, and for innumerable other positive misdemeanors. Now these prohibitory laws do not make the transgression a moral offence, or sin; the only obligation in conscience is to submit to the penalty, if levied. It must, however, be observed, that we are here speaking of laws that are simply and purely penal, where the thing forbidden or enjoined is wholly a matter of indifference, and where the penalty inflicted is an adequate compensation for the civil inconvenience supposed to rise from the offence. But where disobedience to law involves in it also any degree of public mischief or private injury, there it falls within our former distinction, and is also an offence against conscience.

We have now gone through the definition laid down of a municipal law; and have shown that it is "a rule of civil conduct, prescribed by the supreme power in a state, commanding what is right, and prohibiting what is wrong;" in the explication of which we have endeavoured to interweave a few useful principles concerning the nature of civil government, and the obligation of human laws. Before we conclude this part, it may not be amiss to add a few observations concerning the interpretation of laws.

Interpretation of laws.

When any doubt arose upon the construction of the Roman laws, the usage was to state the case to the emperor in writing, and take his opinion upon it. This was certainly a bad method of interpretation. To interrogate the legislature to decide particular disputes, is not only endless, but affords great room for partiality and oppression. The answers of the emperor were called his rescripts, and these had in succeeding cases the force of perpetual laws; though they ought to be carefully distinguished, by every rational civilian, from those general constitutions which had only the nature of things for their guide. The Emperor Macrinus, as his historian Capitolinus informs us, had once resolved to abolish these rescripts, and retain only the general edicts: he could not bear that the hasty and crude answers of such princes as Commodus and Caracalla should be reverenced as laws. But Justinian thought otherwise, and he has preserved them all. In like manner, the canon laws, or decretal epistles of the popes, are all of them rescripts in the strictest sense. Contrary to all true forms of reasoning, they argue from particulars to generals.

The fairest and most rational method to interpret the will of the legislator, is by exploring his intentions at the time when the law was made, by signs the most natural and probable. And these signs are either the words, the context, the subject-matter, the effects and consequence, or the spirit and reason of the law. Let us take a short view of them all.

1. *Words* are generally to be understood in their usual and most known signification; not so much regarding the propriety of grammar, as their general and popular use. Thus the law mentioned by Puffendorf, which forbade a layman to lay hands on a priest, was adjudged to extend to him who had hurt a priest with a weapon. Again: Terms of art, or technical terms, must be taken according to the acceptation of the learned in each art, trade, and science. So, in the act of settlement, where the crown of England is limited "to the Princess Sophia, and the heirs of her body being Protestants," it becomes necessary to call in the assistance of lawyers to ascertain the precise idea of the words "heirs of her body," which, in a legal sense, comprise only certain of her lineal descendants. Lastly, Where words are clearly repugnant, in two laws, the latter law takes place of the elder; *leges posteriores priores contrarias abrogant,* is a maxim of universal law, as well as of our own constitutions. And accordingly it was laid down by a law of the twelve tables at Rome, *Quod populus postremum jussit, id jus ratum esto.*

2. If words happen to be still dubious, we may establish their meaning from the *context;* with which it may be of singular use to compare a word or a sentence, whenever they are ambiguous, equivocal, or intricate. Thus the proëme, or preamble, is often called in to help the construction of an act of parliament. Of the same nature and use is the comparison of a law with other laws that are made by the same legislator, that have some affinity with the subject, or that expressly relate to the same point. Thus, when the law of England declares murder to be felony without benefit of clergy, we must resort to the same

law of England to learn what the benefit of clergy is; and, when the common law censures simoniacal contracts, it affords great light to the subject to consider what the canon law has adjudged to be simony.

3. As to the *subject-matter*, words are always to be understood as having a regard thereto; for that is always supposed to be in the eye of the legislator, and all his expressions directed to that end. Thus, when a law of Edward III. forbids all ecclesiastical persons to purchase provisions at Rome, it might seem to prohibit the buying of grain and other victual; but when we consider that the statute was made to repress the usurpations of the papal see, and that the nominations to benefices by the pope were called *provisions*, we shall see that the restraint is intended to be laid upon such provisions only.

4. As to the effects and *consequence*, the rule is, That where words bear either none, or a very absurd signification, if literally understood, we must a little deviate from the received sense of them. Therefore the Bolognian law, mentioned by Puffendorf, which enacted, "that whoever drew blood in the streets should be punished with the utmost severity," was held after long debate not to extend to the surgeon who opened the vein of a person who fell down in the street with a fit.

5. But, lastly, the most universal and effectual way of discovering the true meaning of a law, when the words are dubious, is by considering the *reason* and *spirit* of it, or the cause which moved the legislator to enact it. For when this reason ceases, the law itself ought likewise to cease with it. An instance of this is given in a case put by Cicero, or whoever was the author of the rhetorical treatise inscribed to Herennius. There was a law, that those who in a storm forsook the ship, should forfeit all property therein, and the ship and lading should belong entirely to those who staid in it. In a dangerous tempest, all the mariners forsook the ship, except only one sick passenger, who, by reason of his disease, was unable to get out and escape. By chance the ship came safe to port. The sick man kept possession, and claimed the benefit of the law. Now here all the learned agree, that the sick man is not within the reason of the law; for the reason of making it was, to give encouragement to such as should venture their lives to save the vessel; but this is a merit which he could never pretend to, who neither staid in the ship upon that account, nor contributed any thing to its preservation.

Equity.

From this method of interpreting laws by the reason of them, arises what we call *equity*, which is defined by Grotius, "the correction of that, wherein the law (by reason of its universality) is deficient." For since in laws all cases cannot be foreseen or expressed, it is necessary that, when the general decrees of the law come to be applied to particular cases, there should be somewhere a power vested of defining those circumstances which (had they been foreseen) the legislator himself would have expressed. And these are the cases which, according to Grotius, *lex non exacte definit, sed arbitrio boni viri permittit.*

Equity thus depending essentially upon the particular circumstances of each individual case, there can be no established rules and fixed precepts of equity laid down, without destroying its very essence, and reducing it to a positive law. And, on the other hand, the liberty of considering all cases in an equitable light must not be indulged too far, lest thereby we destroy all law, and leave the decision of every question entirely in the breast of the judge. And law without equity, though hard and disagreeable, is much more desirable for the public good than equity without law, which would make every judge a legislator, and introduce infinite confusion; as there would then be almost as many different rules of action laid down in our courts, as there are differences of capacity and sentiment in the human mind.

For some account of the laws and judicial establishments of England and Scotland, and generally of the principal countries of Europe, the reader is referred to the respective articles concerning them in this work.

LAW OF NATIONS.

I.—*Ideas involved in the term Law.—These ideas how modified in the term Law of Nations.—The only sanction applicable to the Law of Nations is the popular sanction.—What dependence may be placed upon the popular sanction.*

IN the meaning of the word Law, three principal ideas are involved; that of a command, that of a sanction, and that of the authority from which the command proceeds.

Every law imports that something is to be done, or to be left undone.

But a command is impotent, unless there is the power of enforcing it. The power of enforcing a command is the power of inflicting penalties if the command is not obeyed. And the applicability of the penalties constitutes the sanction.

There is more difficulty in conveying an exact conception of the authority which is necessary to give existence to a law. It is evident that it is not every command, enforced by penalties, to which we should extend such a title. A law is not confined to a single act; it embraces a class of acts: it is not confined to the acts of one man; it embraces those of a community of men. And the authority from which it emanates must be an authority which that community are in the habit of obeying. An authority to which only a temporary obedience is paid, does not come up to the notion of that authority which is requisite to give existence to laws; for thus the commands of a hostile army, committing plunder, would be laws.

The conditions which we have thus described may all be visibly traced in the laws which governments lay down for the communities to which they belong. There we observe *the command*, there *the punishment* prescribed for its violation, and there *the commanding authority* to which obedience is habitually paid.

Of these conditions, how many can be said to belong to any thing included under the term Law of Nations?

By that term is understood, something which either does, or which, it is supposed, ought to bind the conduct of one nation towards another.

But it is not understood that one nation has a right to command another. When one nation can be commanded by another, it is dependent upon that other; and the laws of dependence are different from those which we are at present considering. An independent nation would resent, instead of obeying, a command delivered to it by another. Neither can it properly be said that nations, taken aggregately, prescribe those laws to one another severally; for when did they ever combine in any such prescription? When did they ever combine to vindicate the violations of them? It is therefore clear, that the term command cannot be applied, at least in the ordinary sense, to the laws of nations.

In the next place, it would not seem that any thing deserving the name of sanction belongs to them. Sanction, we have already seen, is punishment. Suppose nations to threaten one another with punishment, for the violation of any thing understood to be a law of nations. To punish implies superiority of strength. For the strong, therefore, the law of nations may perhaps have a sanction as against the weak. But what can it have as against the strong? Is it the strong, however, or is it the weak, by whom it is most liable to be violated? The answer is obvious and undeniable. As against those from whom almost solely any violation of the laws of nations need be apprehended, there appears, therefore, to be no sanction at all.

If it be said that several nations may combine to give it a sanction in favour of the weak, we might, for a practical answer, appeal to experience. Has it been done? Have nations in reality combined, so constantly and steadily, in favour of the law of nations, as to create, by the certainty of punishment, an overpowering motive to unjust powers, to abstain from its violation? For, as the laws against murder would have no efficacy if the punishment prescribed were not applied once in fifty or a hundred times, so the penalty against the violations of the law of nations can have no efficacy if it is applied unsteadily and rarely.

On the mode in which it has been applied, we may appeal to a great authority. Montesquieu says, "Le droit public est plus connu en Europe qu'en Asie: cependant on peut dire que les passions des princes, la patience des peuples, la flatterie des ecrivains, en ont corrompu tous les principes. Ce droit, tel qu'il est aujourd'hui, est une science qui apprend aux princes jusqu'à quel point ils peuvent violer la justice, sans choquer leurs intérêts." (*Lettres Persanes*, xciv.)

To go a little deeper, we may consider whether the interest of nations, that which in the long run governs them all, can ever produce combinations, from which an effectual sanction, of the nature in question, can be expected to proceed. That they would derive some advantage from the general observation of those maxims which have been called laws of nations, frivolous as are the points upon which the greater part of them turn, cannot be denied. These advantages, however, are seen at a distance, and with the mind's eye; they are speculative rather than sensible. The inconveniences, on the other hand, which must result from any movement to lend effect to the law of nations, are immediate and formidable; the whole train of the evils of war are almost sure to arise from them. The latter class of impressions must, in general, be far more powerful than the former; and thus the interposition in favour of the law of nations will generally be shunned. A nation is often but too easily stimulated to make war in resentment of injuries done to itself. But it looks with too much coolness upon the injuries done to other nations, to incur the chance of any great inconvenience for the redress of them.

Besides, the object is to be gained by the means of combination. But the combinations of nations are very difficult things. Nations hardly ever combine without quarrelling.

Again, all nations ought to combine for an object common to all. But for all nations to combine in any one enterprise is impossible. Suppose a prince to have violated the law of nations, it would be absurd to suppose that all the countries on earth should conspire to punish him. But if not all, what is to be the selection? Who shall come forward; who stand excused? By those who are condemned to the sacrifice, in what proportion are the contributions to be made? Who is to afford the greatest, and who may come with the least?

It is unnecessary to pursue any farther the analysis of this extraordinary hypothesis. It is evident, from what has been said, that it is full of impracticabilities.

Are we, then, obliged to consider the maxims or rules which pass under the name of Laws of Nations, as utterly without force and influence; and the discourse which is made about them as mere affectation and impertinence?

Not wholly so. It is of use that the ordinary intercourse of nations should be conducted according to certain forms, generally known and approved; because they will be observed on all occasions when there is no particular motive to violate them, and will often prevent disputes which might arise on frivolous occasions. They resemble in this respect the ceremonial of a court, or the established forms of polished society.

The objects, however, which are understood to be embraced by the law of nations, are of two sorts. The first are those minor objects which partake more of form than of substance; the other are objects which deeply affect humanity. That there are certain interests of nations, which it were good to have considered as their rights, and of which it is infinitely to be desired that the violation could be prevented, is most true. But if national law has no penalty annexed to it; if the weaker party who is wronged has no means of redress, where, it may be said, is the advantage of such a law? Or where the propriety of calling that a law which is only a declaration respecting rights; violated by the more powerful party with impunity, as often, and to as great an extent, as he pleases?

There is still, however, a power which, though it be not the physical force either of one state or of a combination of states, applied to vindicate a violation of the law of nations, is not without a great sway in human affairs; and which, as it is very nearly the whole of the power which can be applied to secure the observation of that law, deserves to be carefully considered, that, by duly appreciating its efficacy in this important affair, we may neither trust to it where it will disappoint our expectation, nor neglect the use of it where it may be turned to advantage.

That the human mind is powerfully acted upon by the approbation or disapprobation, by the praise or blame, the contempt and hatred, or the love and admiration, of the rest of mankind, is a matter of fact, which, however it may be accounted for, is beyond the limits of dispute. Over the whole field of morality, with the exception of that narrow part which is protected by penal laws, it is the only power which binds to good conduct, and renders man agreeable and useful to man. It is evident, also, that where there is not great inequality, it is a power, the binding force of which must be necessarily great; because every individual, considered in himself, is weak and helpless as compared with the rest of the community. Unless, therefore, he can prevail upon them to abstain from injuring him, he must be exposed to unlimited suffering. And if, on the other hand, he can prevail upon them to combine in doing, or in desiring to do, him good, he is put in the way of receiving perpetually the greatest advantages. His motive, therefore, to obtain the favourable and to avoid the unfavourable regards of the members of the society in which he lives, is of the highest order. But he can obtain their favourable, and avoid their unfavourable sentiments, only by abstaining, with scrupulous anxiety, from doing any injury to them, and observing all such modes of conduct as are calculated to be useful and agreeable to them.

The value which men set upon these favourable regards of the persons among whom they live, is strikingly manifested by some of the most ordinary forms of their discourse and behaviour. What is more esteemed than character? What injury reckoned more deep and unpardonable, than that of the man who exerts himself to take away unworthily any part of the reputation of his neighbours? But what is character, if not the title to the favourable sentiments of other men? And what is the loss of character, but the opinion of other men that we do not deserve those favourable sentiments with which they have been accustomed to regard us?

Honour and shame, those emotions, the intensity of which is proved by so many phenomena of human life, are but the feelings which attend upon those different situations. When a man finds himself in possession of the love, the esteem, and admiration of those by whom he is surrounded, he is filled with that delight which the belief of the secure possession of a great source of benefit cannot fail to inspire: he is fearless, elated, and confident; the principal characteristics of that state of mind which we denominate pride. When he is conscious, on the other hand, of having forfeited in any degree the favourable sentiments of those among whom he lives, he suffers that depression which the loss of a highly valued possession is calculated to create; he ceases, in some degree, to look forward to his fellow-men for good, and feels more or less the apprehension of evil at their hands; he fears to prove how far their disapprobation of him reaches, or to excite them to define it too accurately for themselves; he hangs down his head, and dares not so much as look them in the face.

When men are favourably situated for having those impressions deeply struck, or, more correctly speaking, when those combinations of ideas have consistently and habitually been presented to their minds, the association becomes at last so indissoluble and strong, as to operate, even where the connection among the things themselves may not exist.

When persons who have been educated in a virtuous society have, from their infancy, associated the idea of certain actions with the favourable sentiments, and all the advantages which flow from the favourable sentiments, of mankind; and, on the other hand, have associated the idea of certain other actions with the unfavourable sentiments, and all the disadvantages which flow from the unfavourable sentiments, of mankind; so painful a feeling comes in time to be raised in them at the very thought of any such action, that they recoil from the perpetration of it, even in cases in which they may be perfectly secure against any unfavourable sentiments which it might be calculated to inspire.

It will, we apprehend, upon the most accurate investigation, be found, that this is the only power to which we can look for any considerable sanction to the laws of nations; for almost the only species of punishment to which the violation of them can ever become amenable: it is the only security, therefore, which mankind can ever enjoy for the benefit which laws, well contrived for this purpose, might be calculated to yield.

It is, in the next place, incumbent upon us to inquire, what dependence can be placed upon this security, in the set of cases now under consideration; and in what circumstances it is calculated to act with the greatest, in what with the least efficacy, towards this important end.

A power which is wholly derived from the good which may follow the favourable, the evil which may follow the unfavourable, sentiments of mankind, will act most efficaciously upon him who is the most, least efficaciously upon him who is the least, exposed to receive good and evil from the immediate inclination of his fellow-men.

It seems to be evident, that he who is most weak, as compared with the rest of the community, is the most exposed to receive good or evil in consequence of their favourable or unfavourable sentiments; and that he, on the other hand, who is the most powerful, as compared with them, is the least exposed to receive good or evil in consequence of those sentiments.

When men are nearly upon equality, no one has any chance of inducing other people to abstain from hurting him, but by his abstaining from doing hurt in any way to them. He has no means of inducing them to do him any acts of service, but by their expectation of receiving similar acts of service from him. He is, therefore, intensely interested in its being generally believed of him, that he is a man who is careful to abstain from injuring, and ever ready to exert himself to do services to others.

The case is exceedingly different where one man is lifted high above others. In that case, he has powerful means of protection against their hurtful acts, powerful means of obtaining their services, altogether independent of his conduct, altogether independent of his disposition either to abstain from injuring them, or to render them service.

So far, therefore, as good conduct arises from a man's dependence upon the sentiments of others; and from this is derived the moral power, to which alone the term moral sanction or obligation can properly belong; the security for good conduct is apt to be lessened, in exact proportion as any one is raised above the level of those composing the mass of the community. If any man possesses absolute power over the rest of the community, he is set free from all dependence upon their sentiments. In this, or nearly in this situation, is every despot having a well-established authority. So far as a man is educated as a despot, he can therefore have but few of those associations on which a conduct beneficent to others depends. He is not accustomed to look, for the services which he needs, or the evils which he apprehends, from others, to the opinion which they may entertain of the goodness or badness of his conduct; he cannot, therefore, have that salutary train of transitions from the idea of an evil act to that of the condemnatory sentiments of mankind, and from the condemnatory sentiments of mankind to the forfeiture of all those delights and advantages which spring to him from the operation of their favourable regards; associations which in men favourably situated become at last habitual, and govern the conduct, as it were mechanically, without any distinct recurrence to the consequences, upon the thought of which, nevertheless, this salutary and ennobling sentiment ultimately depends, and from which it has been originally derived.

If such is the situation of the despot with regard to these important associations, it is in a proportional degree the situation of all those who partake of that species of elevation. In an aristocratical country, for example, a country in which there is great inequality of wealth, those who possess the large fortunes are raised to a great degree above any chance of receiving evil, or of standing deprived of any good, because the great mass, the lower orders, of their countrymen, think unfavourably of them. They are, no doubt, to a considerable degree dependent upon what the people of their own class may think of them; and it is accordingly found, that those qualities and acts which are useful to that class are formed into a particular, an aristocratical code of morality, which is very effectually sanctioned by the favourable and unfavourable sentiments of the aristocratical body, at the same time that it is exceedingly different from that more enlarged and all-comprehensive code, on which the happiness of the greatest number depends, and to which alone the epithet moral in propriety belongs.

Such being the state of the facts connected with this important case, it remains to see what are the inferences bearing upon it which we are entitled to draw from them.

We have already ascertained, that the only power which can operate to sanction the laws of nations, in other words, to reward or punish any nation, according as it obeys or as it disobeys them, is the approbation and disapprobation of mankind. It follows, that the restraining force is, in this case, determined by the associations which they who govern it may have formed with the approbation and disapprobation of mankind. If they have formed strong associations of a pleasurable kind with the approbation, strong associations of the painful kind with the disapprobation, of mankind, the restraining force will be great; if they have not formed such associations, it will be feeble and insignificant. It has, however, appeared, immediately above, that the rulers of a country, of which the government is either monarchical or aristocratical, can have these associations in but a very low degree; as those alone, who are placed on a level with the great body of other men, are placed in circumstances calculated to produce them. It is only then in countries, the rulers of which are drawn from the mass of the people, in other words, in democratical countries, that the sanction of the laws of nations can be expected to operate with any considerable effect.

II.—*What is required to give to the Law of Nations its greatest perfection.—Necessity for a Code of International Law.—Rights of Nations.*

Having thus ascertained what is the power which restrains from violating the laws of nations, and what the description of rulers upon whom its restraining force is the greatest, we are next to inquire by what expedients the force of it may be raised to the greatest pitch, and the greatest amount of benefit may be derived from it.

It is sufficiently recognised, that whatever is intended to produce any effect as a punishment, produces it in a greater degree, in proportion as it operates with greater precision and certainty. The inquiry, then, regards the means of giving precision and certainty to those sentiments of the world, on which the binding power of the laws of nations so greatly depends.

Two things are necessary to give precision and certainty to the operation of laws within a community. The one is a strict determination of what the law is; the second, a tribunal so constituted as to yield prompt and accurate execution to the law. It is evident that these two are indispensable requisites. Without them no penalties can operate with either precision or certainty. And the case is evidently the same, whether we speak of the laws which regulate the actions of individual and individual within the state, or those which regulate the actions of one state towards another.

It is obvious to remark, in the first place, that, with regard to the laws of nations, not one of those two indispensable requisites has ever yet had any existence. It has neither been determined what the laws in question are, nor has any common tribunal for cognizance of the violations of them ever been constituted. With respect to the last, not so much as the idea of it seems to have been entertained. And with respect to the first, though much has been written, it has been almost wholly in the way of vague and general discourse. Hardly a single accurate definition has yet been applied to any part of the subject.

Here, then, we come to what is obviously the grand inquiry; namely, *first*, what can be done towards defining the laws of nations? and, *secondly*, what can be done towards providing a tribunal for yielding prompt and accurate decisions in conformity with them? in other words, for applying with the greatest possible efficacy the opinion of the world for restraining the violation of them?

In the article Jurisprudence, to which it is necessary for us here to revert, we have sufficiently made it appear, that the foundation of all law is the constitution of rights. Of two parties, unless it is previously determined what each shall enjoy, it can never be determined whether one has improperly disturbed the enjoyment of the other. To determine, however, what a party is to enjoy, is to determine his rights.

Now then, with regard to nations, the question is, what ought to be constituted rights? or, in other words, what would it be desirable for the good of mankind upon the whole, that the several nations should respect as the rights of each other?

This, it is pretty obvious, is one of the most extensive of all inquiries, far exceeding the limits of an article in the present work. We can attempt little more than to show the way in which the inquiry may be carried on.

In the article Jurisprudence, we have endeavoured to clear up the meaning which in legislation can, without leading to confusion, be alone attached to the term *rights;* and we have there likewise seen, that there are but two classes of objects in which individuals can have rights, namely, things and persons.

The case, we believe, will be found the same with respect to nations. They also can have rights in nothing but persons and things. Of course it follows that they can receive injury in nothing but in persons or things.

The inquiry, however, with respect to the rights of nations, is not so simple as that with respect to the rights of individuals; because, between individuals subject to the same system of laws, the legislature recognises no state of hostility; but between nations there is the state of war and the state of peace, and the rights which are understood to belong to nations are different in these two different states. In the state of war, nations recognise in one another very few rights respecting either persons or things; they kill the one, and take and destroy the other, with little other limit than the want of ability. In the state of peace they respect as rights belonging to one another, nearly the same things which are constituted rights of individuals, by the ordinary systems of national law.

III.—*What should be recognised as Rights in time of Peace.—The Property of Individuals.—The Persons of Individuals.—The Property or Dominion of the State.—Dominion in Land.—Dominion in Water.*

We shall begin with the consideration of those things which it would be desirable that nations should respect as the rights of one another in the time of peace.

And, *first,* of rights with respect to things. As the subject of the rights of nations, things may be divided into two sorts; things belonging to some individual member of the nation, and things belonging to the nation in its collective or corporate capacity.

Those rights in things which the nation guarantees to its individual members within the nation, it would be desirable, with hardly any exception, that nations should respect in regard to one another; that those things, for example, which the government of the country to which a man belongs, would regard, and would compel all its subjects to regard, as his property, the governments of all other countries should respect, and compel all their subjects to respect as his property.

There are two states of circumstances in which questions may arise between nations, respecting the property of their respective subjects. The first, where the property in question, when the cause of dispute arises, is within the country of the individual to whom it belongs. The second, where the property has by its owner been previously removed into the foreign country, with which, or some of the inhabitants of which, the dispute has arisen.

1. The first set of circumstances exists between two conterminous countries, the bordering inhabitants of which being neighbours to one another, may, as any other neighbours, infringe the properties of one another. The proper mode of settling these disputes seems to be sufficiently obvious. The rights of the party complaining should be adjudged according to the laws of the country to which he belongs. But the party sued or prosecuted should be amenable only to the tribunals of the country to which he belongs; that is to say, the question should be tried before the tribunals of the country of the defendant; but the definition of the right in question should be taken from the law of the country to which the plaintiff belongs. It might in some cases be convenient for countries in this situation to agree in constituting a common judicature, appropriated to these disputes, to consist, for example, of two judges, one of each country, with power to choose a third when they could not agree.

The injury complained of may be capable of redress by a remedy of the nature of a civil suit merely; or it may be of that more atrocious sort, theft or robbery, for which the remedy of punishment is required.

It would appear that punishment ought to be apportioned according to the laws of the country to which the party who has incurred it belongs. Whatever would be the punishment decreed for the offence, if committed against a man of his own country, such a punishment he ought to sustain for the offence against the man of the other country. The question of punishment is here understood as extraneous to that of compensation. This ought always to be made to the party injured, where it is capable of being made, and in a case of property it is always capable; if not by the author of the injury, from want of property, or other cause, at least by the government of the country to which he belongs.

2. Where a man has removed his property from his own into another country, there seems to be no peculiar reason why it should be regulated by any other laws than those of the country into which he has removed it; why the rights which it confers should be otherwise determined, or the violation of them otherwise punished.

We have now considered, though in a very general manner (and our limits preclude us from attempting any thing more), the mode in which nations should agree about the rights of one another (in other words, the laws they should establish), in as far as the property of individuals belonging to them is concerned. After the *property* of individuals, their *persons* are to be considered as requiring the protection of laws.

There is more difficulty in determining what is desirable, as international law, with regard to this part of the subject, than that which regards the property of individuals. It is desirable that the persons of the inhabitants of every country should receive protection according to the laws of their own country; but it is also desirable that each man should sustain punishment according to the laws of his country; and these two objects are to a certain extent inconsistent with one another.

The inconvenience, however, seems to be greater, in permitting the inhabitants of one country to be punished according to the laws of another, than in leaving the inhabitants of one country to the same measure of protection against injury to their persons from the inhabitants of other countries, as is afforded to the inhabitants of those countries by their own laws. Many cases, indeed, may be conceived, in which this is a measure of protection which all reasonable men would allow to be inadequate. In such cases, however, the only remedy seems to be the formation of a compact, by which a mode of proceeding, agreeable to the sentiments of both parties, may be positively prescribed. This latter expedient is of course extraneous to that equitable construction which ought to be uniformly applied by the tribunals of one country to the injuries perpetrated, by those whom they may have to judge, upon the inhabitants of another country. If an inhabitant of Persia, for example, should force cow-broth down the throat of an inhabitant and native of Hindustan, the tribunals of Persia should not punish this outrage as they would punish one Persian for making another swallow the same liquid. To the Persian it would be a trifling injury, and more than a trifling punishment would not be required. To the Hindu it would be one of the greatest of all conceivable injuries. It ought to be, therefore, put upon the same footing with an injury of an equal degree done to a Persian; the nature of the injury, not the external act, should be the object of consideration; and whatever the punishment which would be awarded against a Persian for one of the greatest injuries of which he could be guilty to a Persian, the same ought to be inflicted upon him for this, one of the greatest which he could occasion to a Hindu.

Besides the cases in which a government, as representative of the country, may be injured through the individuals who live under its protection, there are cases in which it may be injured more directly. Certain things belong as property to the government, without belonging to any individual; and there are persons, members of the government, or agents of the government, who may receive injuries in that capacity, distinct from those which affect them as private individuals. These are the cases to which it now remains that we direct our attention.

Those things which belong to government as goods and chattels; its moveables, for example; or the lands which it holds, as any individual holds them, in the way of an estate; there seems to be no reason for considering as subject to any other rules than those applicable to the goods and chattels which belong to individuals.

Of other things, those to which any government can claim a right, as representative of a nation, must be either, first, portions of land, or, secondly, portions of water.

1. The questions which relate to the rights which any nation may claim in any portion of land, are questions regarding boundaries; and these involve the whole of the questions respecting the acquisition of dominion.

To have any standard for determining questions with regard to dominion, the different modes of acquiring dominion must be recognised; those which are proper to be allowed and respected by other nations must be distinguished from those which are improper, must be accurately defined, and the definitions made known.

For this purpose it is easy to perceive that the same process is necessary as that for the definition of rights, described at some length in the article in this work entitled JURISPRUDENCE, to which we must again refer.

It is necessary, according to that example, that the events which are to be considered as giving commencement to a right of dominion, and those which are to be considered as putting an end to it, should be fully enumerated, and accurately defined.

This is the first part of the process. The other part is, to distinguish the different degrees of dominion. There is a dominion which is perfect, which includes every power over the subject in question, and leaves nothing farther to be acquired, a *dominium plenum;* there is also a dominion, which is but the commencement, as it were, of dominion, and includes the smallest possible fragment of a full dominion. These are the two extremes; and between them are various distinguishable degrees. All these should be fully enumerated, and accurately defined.

When any of those events occurs which are to be considered as giving commencement to rights, it often happens that they are accompanied by circumstances which limit the right they would otherwise convey, and render the dominion less than full. These circumstances ought also to be completely enumerated, and the power of each to be accurately defined.

If this were done, an international code would be composed, in which the rights of dominion would be accurately defined; and to determine any question about boundaries, or about the degree of dominion, nothing farther would then be necessary than an adequate inquiry respecting the state of the facts.

The questions would exactly resemble those which we have already described in the article JURISPRUDENCE, in analyzing what is called pleading in judicature. In a question about boundaries there is, let us suppose, a district over which one country affirms that it has a right of dominion, a dominion more or less complete, and another country denies that it has that right. The first question is, whether any of those events has occurred which would give the affirming country a right of dominion? The second question is, whether, if such an event had occurred, it was accompanied with any of those circumstances which limit dominion, and render it less than full; and if so, under what degree of limiting power they are classed? The third question is, whether, if an event thus giving commencement to a right of dominion had occurred, any other event putting an end to that right had subsequently occurred?

We need not here enlarge upon these several topics, because they will be sufficiently understood by those readers who bear in mind the expositions already given in the article referred to; and to those who do not, we suggest the propriety of recurring to that article, as a preparation for the perusal of this.

It is evidently disproportionate to the limits which we must here prescribe to ourselves, to enumerate the events which it would be agreeable to the interests of mankind in general that nations should regard as giving, and alone giving, commencement and termination to rights of dominion, because, in order to afford an enumeration which would be in any degree instructive, the reasons must be given why one set of events, and not another, should have the privilege in question conferred upon them.

It may be proper, however, in the mean time, to observe, that the events in question will not be found to be numerous, nor very difficult to discover. In fact they are, and among civilized nations almost always have been, pretty nearly agreed upon; and they are the questions of modification, and questions of fact, upon which chiefly differences have arisen. For example, there is no dispute that occupancy, where there is no prior right, is an event which should be considered as giving commencement to a right of dominion. Neither is there any doubt that the consent of those who have a right may transfer that right to others; or, in other words, that such consent is an event which gives commencement to a right in those others. Conquest, also, made in a lawful war, is recognised as an event of the same description; and it will be found upon inquiry that these do in fact constitute the whole. For, on every occasion on which dominion is acquired, the territory so acquired must beforehand either have belonged to somebody, or have belonged to nobody. If it belonged to nobody, occupancy is the only event which can be supposed to give commencement to the right. If it belonged to somebody, it must be taken from him, either willingly or by force. If it is taken from him willingly, we have his consent. If it is taken by force, it is by conquest in war that the new right is created.

It is evidently, however, farther necessary, that the different species of consent should be distinguished, and those to which it would be proper to attach this investitive power separated accurately from those from which it should be withheld. It is here, accordingly, that the doctrine of contracts would need to be introduced; that the different species of them applicable to this subject, in which all treaties would be included, should be enumerated; that the effects proper to be given to each of them should be defined; and the mode of interpreting them, or fixing the sense which they ought to bear, accurately laid down.

It would also be expedient, after the principal contracts applicable to international concerns are ascertained, to exhibit in the international code, *formulæ*, with blanks to be filled up, which should be employed by nations on all occasions of such contracts; and, being framed with the greatest possible accuracy, would go as far as it would be possible by words to go, in excluding ambiguity and the grounds of dispute.

With respect to conquest, the last event calculated to give commencement to rights of dominion mentioned in the above general enumeration, it is allowed, that as there are some conquests which ought not to be considered as conferring rights of dominion, there are others which ought to be considered as doing so. It is evidently necessary, therefore, that the line of separation should be drawn.

Whether a conquest, however, should or should not be considered as conferring a right of dominion, depends very much upon the nature of the war through which it is made. If the war be what is regarded as just, and the mode of warfare conformable to the recognised rules, the conquest is apt to be regarded as conferring a legitimate title; if the war, and mode of war, be of a contrary description, the validity of the title conferred by the conquest may be liable to dispute.

It is evident, therefore, that in order to define the species of conquest on which the investitive power in question should be conferred, the circumstances which render a war justifiable, and the mode in which it is justifiable to carry it on, must first be ascertained. This forms the second part of our inquiry; and the question regarding the investitive power of conquest must be deferred till that inquiry is performed.

2. Having thus far considered the mode in which should be determined the rights which nations acquire over portions of territory or land, it remains that we consider the mode in which their rights should be determined with regard to waters.

Waters, as concerns the present purpose, are either rivers or the sea.

As the sea involves the questions of greatest extent and importance, we shall attend to that part of the subject first.

Even in the language of ordinary discourse, the sea is denominated the common domain of nations.

The first principle with regard to the sea is this, that all nations have an equal right to the use of it. The utility of recognising this principle is so apparent, that it has never been the subject of any dispute. And all the rights assigned to nations severally in the enjoyment of this common domain ought to rise out of this principle, and to be limited by it. Whatever use any nation makes of it, should be such as not to prevent a similar and equal use from being made by other nations. And every use which cannot be shown to have that effect, should be recognised as a right by the law of nations.

The principal use which nations make of the sea is that of a passage for their ships. Agreeably to the principle which we have recognised, the ships of one nation should pass in such a manner as not to obstruct the passage of those of another. The rules according to which the possible cases of interference should be regulated are very simple, and are, in fact, laid down and acted upon with considerable accuracy. They resemble in all respects those according to which the vessels of the same country are made to avoid and to regulate their interferences in the rivers of the country, or upon its coasts. There would be no difficulty, therefore, in making accurate definitions of the requisite rights, for insertion in the international code.

The rights being established, the violations of them should be punished, on the same principles as those which we have laid down in regard to the preceding cases. Either property has been injured, or persons. In either case, compensation is an indisputable part of the remedial process, wherever it is practicable. In loss of property it is fully practicable. It is also practicable in many of the injuries done to the person. As in the case of offences committed on land, the rights of the individual who has suffered should be estimated according to the laws of the country to which he belongs; but the punishment of the offender should be measured according to the laws of the country to which he belongs. In the case of piracy, which is robbery or murder committed by persons whom no country recognises, and upon whom, therefore, justice can be demanded from no foreign government, it has hitherto been the practice that the nation suffering has taken the punishment into its own hands. Accordingly, the punishment of piracy has always been extremely severe. It would be no doubt better if a mode were adopted by which it would not be necessary for a nation to be judge in its own cause. A rule does not seem impossible to be framed, according to which the punishment of piracy might be provided for, by referring those accused of it either to some general tribunal constituted for that purpose, or to the tribunals of some nation other than that against which the offence has been perpetrated. A general law on this subject, to be observed by all nations, would be highly desirable.

Rules, therefore, seem not difficult to be laid down for regulating the proceedings of nations on the high seas. A distinction, however, is drawn between what is called the *high*, and what is called the *narrow seas*. By the narrow seas is commonly meant some portion of sea to a greater or less extent immediately surrounding a particular country, and in which that country claims peculiar privileges. The question is, whether any such privileges should be allowed, and, if allowed, to what extent?

The regulating principle in this, as in other cases, is the general advantage, the principle of utility. There are cases in which certain privileges in the waters surrounding a particular country are of so much importance to that country, and the exercise of those advantages occasions so very little inconvenience to other nations, that what is lost by all of them taken together bears no comparison with what is gained by that particular nation. In these cases the exercise of such privileges should be allowed; they should, however, be defined, in as many instances as possible, and promulgated by insertion in an international code.

Of the privileges in question, are all those which are essential, or to a considerable degree subservient, to the national security. In some cases the exclusive right of fishing might perhaps come under the same rule. But this is in general provided for by the necessity of drawing the nets, or curing the fish, upon the land, a privilege which, of course, it is in the power of any nation to give or to withhold.

In obedience to this equitable principle, it appears that such foppish privileges as have sometimes been insisted upon, affording no advantage to one nation which is not wholly at the cost of others (lowering the flag, for example, and such like impositions), should not be recognised by the code of nations.

It appears, also, that those tolls which have been sometimes and are levied at the narrow inlets of some seas, deserve to fall under the same condemnation. The passage through these inlets is a common good to all the nations of the earth which may have a motive to use them, a good of the highest importance to the nations which are situated within, and to which it is the only means of maritime communication; and, while it imparts no evil to the conterminous nation, the toll which that nation levies is an advantage obtained wholly at the cost of others, and imposing upon them a burden, in the way of obstruction and trouble, which is compensated for by advantage to nobody.

The waters, we have said, in respect to which rights should be assigned to nations, are rivers and the sea. Having stated what appears necessary on the present occasion with respect to the sea, it remains that we offer the few observations required on the subject of rivers.

Rivers are either the boundary between two countries, or they are wholly within a particular country.

Those which are wholly within a particular country, it seems most agreeable to the principle of utility to regard as wholly belonging to that country. In the case of navigable rivers which pass through several countries, it would indeed be desirable for those countries which are situated higher up than at the mouth of each, as well as for all those who might thus have intercourse with them, that the navigation of such rivers should be free; but it would be difficult so to regulate this right, as not to affect the security of the country through which a free navigation should thus be allowed; and a slight diminution in its security would be so great a loss to that country as would require, to compensate for it, a very great advantage to those by whom the navigation was enjoyed. Unless where this advantage were very great, it would not, therefore, be agreeable to the principle which should dictate the laws of nations, that the freedom of the navigation should be regulated on any other principles than those of mutual agreement.

In regard to those rivers which flow between two countries, the principle of regulation is sufficiently plain. The benefits derivable from the river should be shared equally between them. Its principal benefits arise from the fishing and from the navigation. The right of fishing in most cases may be fitly distributed, by each party fishing from its own bank to the middle of the stream. The right of navigating of each must be so exercised as not to obstruct the right of the other. In this case the same sort of rules are required to prevent the ships of the two nations from obstructing one another in a common river, as are found available to prevent the ships of different individuals from obstructing one another in a river belonging to one country. There is no difficulty, therefore, here, which it is worth stopping to show how to remove.

IV.—*What should be recognised as Rights in time of War.—What should be regarded as necessary to render the Commencement of a War just.—What should be regarded as just and unjust in the Modes of carrying on a War.*

We have now adduced what our limits admit to be said upon the first great branch of the inquiry relative to the law of nations, namely, the rights which they should recognise in one another in the state of peace. We proceed to the second branch, relating wholly to the state of war.

The questions which present themselves for solution relating to the state of war, are either those which respect its commencement, or those which respect the mode of carrying it on.

With respect to the commencement of a war, the principal question is, What are the conditions which should be regarded as necessary to render it just?

As men, in a situation where laws, and the protection derived from them, do not exist, are left to their own protection, and have no means of deterring other men from injuring them, but making them dread injury in return; so nations, which, with respect to one another, have, as we have seen before, but little protection from the legal sanction, are left to supply its place by this dread of injury in return, which, in the case both of individuals and of nations, may be called the *retributive sanction*, and of which, in the case of nations, war is the principal organ.

From this view of the essence and end of war, we lay down immediatcly one pretty extensive proposition with regard to the conditions necessary to render it just.

As the legal sanction, or punishment for the offences of individuals, ought to operate only where some right has been violated, and the violation has been such as to require it, so the retributive sanction of nations, which is war, ought to operate only where some right of the nation, or something which ought to be traced as a right, has been violated, and where the violation has been such as to require that desperate remedy.

But as not all violations which may possibly be committed of the rights of a nation will justify it in inflicting war, the next object is to draw the line of separation, and distinguish between those violations of the rights of nations which justify, and those which do not justify, the extremity of war.

As the evils which war produces are exceedingly great, it is, first of all, evidcnt, that no violation of rights which is not very great, will, upon the principle which we have so often recognised, suffice to justify it. Of two evils, the least is the choice of all sound legislation.

Of the violation of the rights of individuals in the same country, the cases meet for punishment are capable of being pointed out with a degree of accuracy not wanting much of perfection. Of the violation of the rights of nations committed by one nation against another, the cases which would justify the remedial operation of war are much more difficult to define. The difficulty, indeed, is not universal; for there are cases which may be very satisfactorily defined; and as far as definition can go, it is of the utmost importance that it should be carricd. Uncertainty, then, pervades only one part of the field; which the more we are able to lessen, the greater is the advantage in favour of humanity. If a propcr code of international law were formed, there would be certain defined violations of the rights of nations which would be pointed out, not only as deserving the indignation and hatred of all the world, but as justifying the injured nation before all the world, in inflicting upon its injurer the calamities of war. There would also be certain other injuries pointed out, of a more doubtful character, which might, or might not, according to circumstances not easy to define, be such as to justify recourse to war. The injuries of this secondary character, also, which might, or might not, according to circumstances, justify a war, are capable of being pointed out with a certain degree of accuracy. To a certain degree, likewise, the circumstances which would convert them into justifying causes, are capable of being foreseen. So far definition is capable of extending, and so far, of course, it ought to be carried.

In illustration of this latter class of injuries, we may select the most remarkable, perhaps, and important of all the instances; preparations for a threatened attack. A sense of security is one of the most valuable treasures of a nation; and to be deprived of that sense of security, is onc of the greatest injuries. But what state of preparation shall or shall not be considered as justifying the threatened nation in striking the first blow, in order not to give its enemy the advantage of completing his preparations, and making his attack just at the moment when it would be most destructive, it is perhaps impossible to determine for all cases beforehand; though, no doubt, a certain progress may be made towards that determination, and the bounds of uncertainty may be greatly reduced.

We are aware how general, and therefore how unsatisfactory, these observations are, on the important subject of defining those violations of the rights of nations, which ought to be regarded as justificatory causes of war; but at the same time it is to be observed, that not much more could have been done without framing the code, by actually enumerating and defining the violations for which that remedy should be reserved.

Another consideration is now to be weighed. It is evident, that whatever injuries are done by one nation to another, compensation may almost always bc made for them. It is equally evident, that whatever injury may have been sustained, if compensation is made for it, the justificatory cause of war is removed.

The doctrine of compensation, therefore, is an important part of international jurisprudence. Before recourse is had to war for any violation of rights, compensation ought first to be demanded; and no war, except in cases fit for exception, should be regarded as just, which this demand had not preceded; a demand which should be made through a constituted organ, and in a predetermined modc, as we shall more fully describe in a subsequent page, when we come to treat of an international tribunal.

As there can be no reason why the demand of compensation should not always precede the use of arms, except in cases of such a necessity as will not allow timc for demanding compensation, a necessity for the immediate use of arms, in order to prevent an evil immediately impending, those cases of urgent necessity should, as far as possible, be sought out and defined.

Other circumstances may be enumerated, as belonging to this first stage of the remedy against a nation which places itself in an attitude affecting the sense of security of any of its neighbours. If a nation is making preparations, or cxecuting any other measures calculated to excite alarm, it may be called upon to desist from them; or it may be called upon to give security that it will not make a hostile use of them. Of these securities, hostages are one of the most familiar instances. Various other instances will easily present themselves to the consideration of our readers. Upon this part of the subject, therefore, it is unnecessary for us to enlarge.

It thus appears, that we may lay down, with a considerable degree of precision, the conditions upon which the commencement of a war ought to be regarded as just. It remains, under this head of inquiry, that we show how it may, as far as possible, be determincd, what ought to be regarded as just and unjust in the modes of carrying it on.

This is an inquiry of more complexity, a good deal, than the first. In looking out for a guiding principle, it is evidently necessary to keep in view the end to which every just war is of necessity restricted. That is, compensation for an injury received, and security that a fresh injury shall not be committed. Combining this with the grand principle of humanity and utility, in other words, of morality; namely, that all evil, wilfully occasioned, and not calculated to produce a more than equivalent good, is wickcd, and to be opposed, we obtain one comprehensive and highly important rule; which is this: That in the modes of carrying on war, everything should be condemned by the law of nations, which, without being more conducive, or more in any considerable degree to the attainment of the just end of the war, is much more mischievous to the nation against whom it is done.

As the end is to be gained, in most cases, only by inflicting a loss of men and property upon the opposing nation, it would be desirable that the distinction should be drawn between the modes of inflicting this loss, which are the most, and those which are the least, calculated to inflict pain and suffering, without being more conducive to the end.

Law of Nations.

One distinction is sufficiently remarkable; namely, the distinction between the men who are in arms, or actually opposed to the designs of the belligerent, and the men who are not so; also between the property which belongs to the government of the opposing nation, and that which belongs to private individuals composing the nation.

With respect to the first class of objects, the men in arms, and the property of the government, there is not much difficulty. To produce the loss of them, as rapidly as possible, till the end or purpose of the war is obtained, appears to be a privilege which cannot be separated from the right of warring at all.

With respect to the loss of men, indeed, there is an important restriction. It means the loss of them for the purposes of the war, and no more. If it be practicable to put them in a situation in which they can no longer be of any service to the war, all farther injury to them should be held unjustifiable. Under this rule falls the obligation so generally recognised of making our enemies, as often as possible, prisoners, instead of killing them, and of treating them with humanity while retained in that condition.

That part of the subject, therefore, which relates to men in arms, and to such property as belongs immediately to the government, it is not impossible to include in rules of tolerable precision. The difficulty is with respect to those individuals who, composing the body of the nation, form no part of the men in arms, and with respect to the property of such individuals.

Though it would not be correct to say, that these do not contribute, or rather that they may not be made to contribute, to the means with which the government carries on the war; yet it would be absurd not to recognise a very broad distinction between them and the men and things which are immediately applied, or applicable to the war. A difference, therefore, equally broad, ought, in reason, to be made in the mode of treating them. The mode of treating the one ought to be very different from that of treating the other. As the rule of destruction must be the rule with regard to the first, only limited by certain restrictions; so the rule of forbearance and preservation ought to be the rule with regard to the latter, only to be infringed upon special and justifying circumstances.

Thus far we seem to have travelled with the advantage of light to our path. We may go a little farther with equal certainty, and say, that, as far as regards the persons of those who are not engaged in the immediate business of hostility, very few occasions can occur, in which it would be allowable, upon any just principle of international law, to do them any injury. Leaving them out of the question, we narrow it to the case of the property belonging to individuals; and shall now proceed to see how far the protection of it can be embraced within general rules.

We must suppose the case which is the strongest, that of an invading army. The advantage which is capable of being derived to such an enemy, by seizing and destroying the property of individuals, bears, unless in certain very extraordinary instances, no sort of proportion to the evil inflicted upon the individuals. This, we presume, cannot admit of a dispute. Upon the principle, therefore, so often recognised, as dictating the rules which ought in this affair to be solely obeyed, no such destruction, unless in such instances, ought to be sanctioned by the law of nations. Such property, it is well known, can rarely be counted upon as any considerable resource; because it is to a very great extent in the power of the people invaded to drive their property away, or to destroy it. The property of individuals in an invaded country would in general be a much more certain resource to an invading army, if that army were to purchase from them the articles it desired. And, perhaps, this would be the most advantageous compromise of which the circumstances admit; namely, that the invading army should abstain from the violation of private property, but that it should in return have the benefit of an unrestricted market; that nothing should be done on the part of the government of the invaded country to prevent its subjects from buying and selling with the invaders, as they would with any other parties.

It may no doubt be true, that the plunder and devastation of a province, or other portion of a country, must have an effect in diminishing the resources of the government for carrying on the war. In this point of view, it must be allowed that the destruction of private property is of some importance to the invading nation with regard to the result of the war. But the question, in settling the difficulties of international jurisprudence, is not whether an advantage is gained, but whether the advantage, such as it is, be not gained at too great a cost.

If it be certain that the losing party, in consequence of the destruction in question, loses more than the gaining party gains, it is certain that the two parties, taken together, are losers by the proceeding; and of course that nations, in the aggregate, are losers upon the whole. Nay, it is certain that each nation, taken by itself, is a loser, upon the balance of the cases in which it is liable to lose, and those in which it is liable to gain. If it loses more in the cases in which it bears, than it gains in the cases in which it inflicts invasion, and if it is as liable to bear as to inflict, which is the usual condition of nations, it follows clearly that it is its interest to concur in a rule which shall protect the property of individuals in cases of invasion.

Even in that more civilized mode which has been adopted by invading armies, of availing themselves of the property of individuals, by exacting contributions through the instrumentality of the local authorities; contributions which these authorities are left to partition among the people, as they may deem equitable; though it is admitted that this is a much less hurtful proceeding than military rapine, still we think it will easily appear, that the evil inflicted upon the contributors is greater than the benefits derived to the receivers.

Unless the amount thus received by an invading army is very considerable, the benefit which is derived, the aid which is gained towards accomplishing the end of the war, must be considered as trifling. But if a contribution, the amount of which can be of any considerable avail towards attaining the object of the war, is levied suddenly upon a particular district, a comparatively small portion of the invaded country, it must operate upon the contributors with a dreadful weight of oppression. Upon an equal estimate of the circumstances, it can, therefore, hardly fail to appear that, whether the contribution exacted is heavy or light (it must always be heavy to those who sustain it), the loss to those who suffer must greatly outweigh the advantage to those who receive. If it be so, this mode of exaction should, it is evident, be forbidden by the law of nations.

If these are the principles upon which an international code, regarding this branch of the subject, ought to be constructed, they will enable us to determine the question with regard to the property of individuals in another set of circumstances, to which the rules of civilized society have hardly yet begun to be applied. Whatever rules apply to the property of individuals found upon the land, the same rules ought, by parity of reason, it should seem, to apply to it when found upon the sea.

The conduct of nations, however, has hitherto not been conformable to the parity which appears to belong to the two sets of cases. Some tenderness, more or less, according to the progress of civilization, appears to have been shown, by all but savages, to the property of individuals upon the land. To this hour the property of individuals upon the sea is made prize of without mercy, by the most civilized nations in the world.

The notions of piracy, in fact, have, on this subject, unhappily prevailed, and governed the minds of men. Pirates make prey of everything. Sailors, originally, were all pirates. The seafaring state was a belligerent state, of almost every vessel against every other vessel. Even when nations had gradually advanced into a more civilized state, and when their vessels abstained from injury to one another in a period of peace, they appear, when the ties of peace were dissolved, and they were placed with respect to one another in a state of war upon the seas, to have felt the force of none but their old associations, and to have looked upon the state of war as a state of piracy. Two nations at war with one another continue to act towards the property of individuals belonging to one another at sea, exactly as two nations of pirates would do.

Assuredly this is a state of things to which the present intelligence and morality of the world ought speedily to put an end. The very same reasoning which we have applied to the case of the property of individuals upon the land, is not less conclusive when applied to the property of individuals upon the sea. The loss to the party losing is more than an equivalent for the gain to the party that gains.

There is another consideration of great importance. All nations gain by the free operations of commerce. If, then, we were to suppose that the losses and gains of the two belligerent parties balanced one another, which yet they never do, there is an advantage derived from their commerce to every nation on the earth to which, in any degree, either directly or indirectly, that commerce extends; which advantage is either lost or diminished, by their preying upon the property of the individuals belonging to one another. This, therefore, is an unquestionable balance of loss to the general community of nations, which the law of that community ought to endeavour to prevent.

If, then, we should suppose that it were enacted as the law of nations, that the property of individuals passing on the seas should be equally respected in peace and in war, we may proceed to consider whether any disadvantage, nearly countervailing the general good, would thence accrue to the belligerents.

It may be alleged, that a nation at war with another is retarded in reducing its antagonist, by the riches which the commerce of that antagonist, if undisturbed, will place at its disposal. But it is evident that an advantage to one of two antagonists, when compensated to the other, by a power to overcome that advantage, exactly equivalent, is in reality no advantage at all. Such is the case with the advantage accruing to the nation with which another is at war, when the property of individuals upon the sea is allowed to pass unmolested. If its riches are increased by freedom of commerce, so are those of its antagonist. The advantages are equal where the circumstances are equal, which, in the majority of cases, they undoubtedly are.

If it be still objected, that there may be cases in which they are not equal, the answer is obvious and incontrovertible. There is no general rule without its exceptions, but partial evil must be admitted for general good. Besides, if the case were very remarkable, it might be excepted from the general rule.

If this were adopted as part of the law of nations, all those questions respecting the maritime traffic of *neutrals*, questions which have been the source of so much troublesome inquiry, so much animosity, and so much mischief, would be immediately at an end. If the traffic of the belligerents, so far as concerned the property of individuals, were free, so would be that of all neutral nations.

Places actually blockaded, that is, surrounded with an hostile force for the immediate purpose of being reduced, either by arms or by famine, would still form exceptions; because the admission of ships into them with supplies, either of food or munition of war, would be directly at variance with the very object of the blockade.

In all other cases, the admission either of provisions or of instruments of war into a belligerent country ought, undoubtedly, upon the principle of utility, not to be disturbed. The benefit, except in rare and remarkable cases, could not be material to the country into which they might enter, nor hence the injury to its antagonist; on the other hand, that antagonist would enjoy the same privilege of the free admission of those commodities, and thus they would be equal in all respects. The inconvenience, however, which would thus be saved to the neutrals—the annoyance of search, the loss by detention, the occasions of quarrel—are known to be evils of no ordinary magnitude.

The desertion of sailors from the ships of a belligerent to those of a neutral has given rise to disputes in one instance only, that of Great Britain and the United States of America. The question to be determined, in laying down the principles of international jurisprudence, is, whether this desertion ought to be considered as constituting a ground for the general right of search; in other words, whether the evil to which a belligerent is exposed by desertion, or rather by that portion of desertion which can be prevented by the right of search, is an equivalent for all the evil which is unavoidably produced by it.

Desertion must take place either from the ships of war of the belligerent, or from its merchant ships.

In respect to ships of war, it is so easy for a belligerent to prevent desertion to neutrals, at least in any such degree as to constitute a great evil, that it would be altogether absurd to speak of it as fit to be compared with the evils arising from the right of search. The only occasions on which ships of war can be exposed to desertion to neutrals, must be those on which they go into a neutral port. But on those comparatively rare occasions, they can so easily take precaution against desertion, that the danger to which they are exposed is hardly worth regarding.

When the sailors belonging to merchant ships transfer their services to the ships of a neutral, it is not to be called desertion. It can only take place in very considerable numbers when seamen's wages in the neutral country are much higher than in the belligerent. The sailor, in this case, leaves his own for another country, only because he improves his situation by so doing. This is a liberty which, as it ought to belong to every body, so it ought not to be withheld from the sailor. If, indeed, any nation thinks proper to forbid any class of its people to leave their country, as England with regard to its artificers, other countries cannot help that; but they ought not to be called upon to lend their aid to such an antisocial regulation, by allowing their vessels to be searched, as security against its infringement. Besides, it is evident that there is a much greater security, arising from the very nature of the case, against the chance of a nation's being, to any considerable degree, deprived of its sailors by any such means. If the sailors go into the neutral country because wages are higher there, a small number only will have gone, when wages, from diminution of the numbers, will begin to rise in the country which they have left, and, from increase of the numbers, will begin to fall in the country to which they have been tempted to repair. When the wages of seamen have thus sufficiently risen in the belligerent country, which they are sure to do if the demand for them rises, the sailors will not only come back from every country in the world, but the sailors of other countries will hurry along with them; and the evil of desertion cures itself.

Only two questions of any great importance appear to remain; that relating to the march of troops, for a hostile purpose, through a neutral country, and that relating to the extent to which the operations of a successful war ought to be pursued.

According to the principles which we have already laid down for regulating the proceedings of a hostile army even in the invaded country, namely, that of committing no plunder, and enjoying the right of market, it appears that the right of passing through a neutral country on similar terms should be refused to no party. This rule, while it holds out equal advantages to all belligerents, admits, less than any other rule, grounds of dispute.

The end, which we have already described as that alone the pursuit of which can render any war justifiable, sufficiently defines the extent to which the operations of a successful war ought to proceed. The end of every justifiable war is to obtain compensation for an injury sustained, and security against the repetition of it. The last point, that of security, alone admits any uncertainty. Nations are apt to exaggerate the demand for security; to require too much; very often unconsciously, from the mere cravings of self-love; sometimes fraudulently, as a cover for ambitious views. As the question, however, respecting what may or may not, in each instance, be sufficient security, is a question of fact, not of law, it must be determined, if determined at all, by a tribunal empowered to take cognizance of the facts.

V.—*Of the Construction of an International Code, and an Internationl Tribunal.—How the Nations might concur in framing an International Code.—How an International Tribunal should be constructed.—Form of Procedure before the International Tribunal.*

We have now, then, laid down the principles by which, in our opinion, the rights of nations, in respect to one another, ought to be determined; and we have shown in what manner those principles should be applied, in order to come to a decision in the most remarkable cases. The minor points it is, of course, not in our power to illustrate in detail; but that will not, we should hope, be difficult, after the exemplification exhibited, and the satisfactory solutions at which we seem to have arrived, of all the more considerable questions which the subject presents.

From what has been shown, it is not difficult to see what would be the course pursued by nations, if they were really actuated by the desire of regulating their general intercourse, both in peace and war, on the principles most advantageous to them all.

Two grand practical measures are obviously not only of primary importance toward the attainment of this end, but are of indispensable necessity toward the attainment of it in any tolerable degree. These are, first, the construction of a code; and, secondly, the establishment of a tribunal.

It is perfectly evident, that nations will be much more likely to conform to the principles of intercourse which are best for all, if they have an accurate set of rules to go by, than if they have not. In the first place, there is less room for mistake; in the next, there is less room for plausible pretexts; and, last of all, the approbation and disapprobation of the world is sure to act with tenfold concentration, where a precise rule is broken, familiar to all the civilized world, and venerated by all.

How the nations of the civilized world might concur in the framing of such a code, it is not difficult to devise. They might appoint delegates to meet for that purpose in any central and convenient place, where, after discussion, and coming to as full an undertaking as possible upon all the material points, they might elect some one person, the most capable that could be found, to put these their determinations into the proper words and form; in short, to make a draught of a code of international law, as effectually as possible providing for all the questions which could arise, upon their interfering interests, between two nations. After this draught was proposed, it should be revised by the delegates, and approved by them, or altered till they deemed it worthy of their approbation. It should then be referred to the several governments, to receive its final sanction from their approbation; but, in the mean time, it should be published in all the principal languages, and circulated as extensively as possible, for the sake of two important advantages. The first would be, that, the intelligence of the whole world being brought to operate upon it, and suggestions obtained from every quarter, it might be made as perfect as possible. The second would be, that the eyes of all the world being fixed upon the decision of every nation with respect to the code, every nation might be deterred by shame from objecting to any important article in it.

As the sanction of general opinion is that upon which chiefly, as we have already seen, such a code must rely for its efficiency, not a little will depend upon the mode in which it is recognised and taught. The recognition should in each country have all possible publicity and solemnity. Every circumstance which can tend to diffuse the opinion throughout the earth, that the people of each country attach the highest importance to such a code, is to themselves a first-rate advantage; because it must be of the utmost importance to them, that all the nations of the earth should behave towards them upon the principles of mutual beneficence; and nothing which they can do can have so great a tendency to produce this desirable effect, as its being generally known that they venerate the rules which are established for its attainment.

If nations, then, were really actuated by the desire of regulating their mutual intercourse upon principles mutually beneficent, they would adopt measures for having a code of international law constructed, solemnly recognised, and universally diffused and made known.

But it is not enough that a code should exist: every thing should be done to secure a conduct conformable to it. Nothing is of so much importance for this purpose as a tribunal; before which every case of infringement should be tried, the facts of it fully and completely explored, the nature and degree of the infringement ascertained; and from which a knowledge of every thing material to the case should be as rapidly as possible diffused through the world; before which also all cases of doubt should regularly come for determination: and thus wars, between nations which meant justly, would always be avoided, and a stigma would be set upon those which justice could not content.

The analogy of the code, which is, or ought to be, framed by each state for regulating the intercourse of its own people within its own territory, throws all the illustration which is necessary upon the case of a tribunal for the international code. It is well known, that laws, however carefully and accurately constructed, would be of little avail in any country, if there was not some organ, by means of which it might be determined when individuals had acted in conformity with them, and when they had not; by which also, when any doubt existed respecting the conduct which in any particular case the law required, such doubt might be authoritatively removed, and one determinate line of action prescribed. Without this, it is sufficiently evident that a small portion of the benefit capable of being derived from laws would actually be attained. It will presently be seen how much of the benefit capable of being derived from an international code must be lost, if it is left destitute of a similar organ. We shall first consider in what manner an international tribunal might be constructed; and, next, in what manner it might be appointed to act.

As it is understood that questions relating to all nations should come before it, what is desirable is, that all nations should have equal security for good judicature from it, and should look with equal confidence to its decisions.

An obvious expedient for this purpose is, that all nations should contribute equally to its formation; that each, for example, should send to it a delegate or judge. Its situation should be chosen for its accessibility, and for the means of publicity which it might afford; the last being, beyond comparison, the advantage of greatest importance. As all nations could not easily, or would not, send, it would suffice if the more civilized and leading nations of the world concurred in the design, with such a number of the less considerable as would be sure to follow their example, and would be desirous of deriving advantage from an instrument of protection, which to them would be of peculiar importance.

As it is found by specific experience, and is, indeed, a consequence of the ascertained laws of human nature, that a numerous assembly of men cannot form a good judicatory; and that the best chance for good judicial service is always obtained when only one man judges, under the vigilant eyes of interested and intelligent observers, having full freedom to deliver to the world their sentiments respecting his conduct; the whole of these advantages may be obtained, in this case, by a very effectual expedient. If precedent, also, be wanted, a thing which in certain minds holds the place of reason, it is amply furnished by the Roman law; according to which, a great number of judges having been chosen for the judicial business generally of the year, a selection was made out of that number, according to certain rules, for each particular case.

Every possible advantage, it appears, would be combined in the international tribunal, if the whole body of delegates or judges, assembled from every country, should, as often as any case for decision came before them, hold a conference, and, after mature deliberation, choose some one individual of their body, upon whom the whole duty of judge should, in that case, devolve; it being the strict duty of the rest to be present during the whole of his proceedings, and each of them to record separately his opinion upon the case, after the decision of the acting judge had been pronounced.

It would be, no doubt, a good general rule, though one can easily foresee cases in which it would be expedient to admit exceptions, that the judge, who is in this manner chosen for each instance of the judicial service, should not be the delegate from any of the countries immediately involved in the dispute. The motive to this is sufficiently apparent.

We apprehend, that few words will be deemed necessary to show how many securities are thus provided for the excellence of the judicial service.

In the first place, it seems impossible to question, that the utmost fairness and impartiality are provided for in the choice of the judge; because, of the two parties involved in the dispute, the one is represented by a delegate as much as the other, and the rest of the delegates are indifferent between them. In general, therefore, it is evident, that the sinister interest on the two sides being balanced, and there being a great preponderance of interest in favour of nothing but a just decision, that interest will prevail.

The best choice being made of a judge, it is evident that he would be so situated as to act under the strongest securities for good conduct. Acting singly, he would bear the whole responsibility of the service required at his hands. He would act under the eyes of the rest of the assembled delegates, men versed in the same species of business, chosen on account of their capacity for the service, who could be deceived neither with respect to the diligence which he might exert, nor the fairness and honesty with which he might decide; while he would be watched by the delegates of the respective parties, having the power of interest stimulating them to attention; and would be sure that the merits or demerits of his conduct would be made fully known to the whole, or the greater part of the world.

The judicatory being thus constituted, the mode of proceeding before it may be easily sketched.

The cases may be divided into those brought before it by the parties concerned in the dispute, and those which it would be its duty to take up when they were not brought before it by any of the parties.

A variety of cases would occur, in which two nations, having a ground of dispute, and being unable to agree, would unite in an application to the international tribunal for an adjustment of their differences. On such occasions, the course of the tribunal would be sufficiently clear. The parties would plead the grounds of their several claims; the judge would determine how far, according to the law, they were competent to support those claims; the parties would adduce their evidence for and against the facts on which the determination of the claims was found to depend; the judge would receive that evidence, and finally decide. All this is so perfectly conformable to the course of pleading, and receiving proof, in the case of suits between individuals, as analysed and explained in the article JURISPRUDENCE, that it is unnecessary to be more particular here. If further exposition is required, it will be found upon a reference to the article to which we allude. Decision, in this case, it is observable, fully accomplishes its end; because the parties come with an intention of obeying it.

Another, and a numerous class of cases, would probably be constituted, by those who would come before it, complaining of a violation of their rights by another nation, and calling for redress.

This set of cases is analogous to that, in private judicature, when one man prosecutes another for some punishable offence.

It should be incumbent upon the party thus applying to give notice of its intention to the party against which it is to complain, and of the day on which it means that its complaint should be presented.

If both parties are present when the case comes forward for trial, they both plead, according to the mode described in the article JURISPRUDENCE; evidence is taken upon the decisive facts; and if injury has been committed, the amount of compensation is decreed. When it happens that the defendant is not present, and refuses to plead, or to submit, in this instance, to the jurisdiction of the court, the inquiry should notwithstanding go on; the allegations of the party present should be heard, and the evidence which it adduces should be received. The non-appearance of the party defendant should be treated as an article of evidence to prove the truth of its opponent's allegations. And the fact of not appearing should itself be treated as an offence against the law of nations.

It happens, not unfrequently, when nations quarrel, that both parties are in the wrong; and on some of these occasions neither party might think proper to apply to an equitable tribunal. This fact, namely, that of their not applying to the international tribunal, should itself, as stated before, be marked in the code as an international offence, and should be denounced as such by the international tribunal. But even when two offending parties do not ask for a decision from the international tribunal, it is not proper that other nations should be deprived of the benefit of such a decision. If these decisions constitute a security against injustice from one another to the general community of nations, that security must not be allowed to be impaired by the refractory conduct of those who dread an investigation of their conduct.

Certain forms, not difficult to devise, should be laid down, according to which, on the occurrence of such cases, the tribunal should proceed. First of all, it is evident that the parties in question should receive intimation of the intention of the court to take cognizance of their disputes on a certain day. If the parties, one or both, appeared, the case would fall under one of those which have been previously as above considered. If neither party appeared, the court would proceed to estimate the facts which were within its cognizance.

It would have before it one important article of evidence, furnished by the parties themselves, namely, the fact of their non-appearance. This ought to be considered as going far to prove injurious conduct on both sides. The evidence which the court would have before it, to many specific facts, would be liable to be scanty, from the neglect of the parties to adduce their pleas and evidence. The business of the court, in these circumstances, would be, to state correctly such evidence, direct or circumstantial, as it had before it; giving its full weight to the evidence contained in the fact of non-appearance; and to pronounce the decision which the balance of the evidence, such as it was, might be found to support.

Even in this case, in which the practical effect of a decision of the international court may be supposed to be the least, where neither party is disposed to respect the jurisdiction, the benefit which would be derived would by no means be inconsiderable. A decision solemnly pronounced by such a tribunal would always have a strong effect upon the imaginations of men. It would fix and concentrate the disapprobation of mankind.

Such a tribunal would operate as a great school of political morality. By sifting the circumstances in all the disputes of nations, by distinguishing accurately between the false colours and the true, by stripping off all disguises, by getting at the real facts, and exhibiting them in the true point of view, by presenting all this to the world, and fixing the attention of mankind upon it by all the celebrity of its elevated situation, it would teach men at large to distinguish. By habit of contemplating the approbation of such a court attached to just proceeding, its disapprobation to unjust, men would learn to apply correctly their own approbation and disapprobation; whence would flow the various important effects which those sentiments, justly excited, would naturally and unavoidably produce.

As, for the reasons adduced at the beginning of this article, the intention should never be entertained of supporting the decisions of the international court by force of arms, it remains to be considered what means of another kind could be had recourse to in order to raise to as high a pitch as possible the motive of nations respectively to yield obedience to its decisions.

We have already spoken of the effect which would be produced, in pointing the sentiments of mankind, and giving strength to the moral sanction, by the existence of an accurate code, and the decisions themselves of a well-constituted tribunal.

To increase this effect to the utmost, publicity should be carried to the highest practicable perfection. The code, of course, ought to be universally promulgated and known. Not only that, but the best means should be in full operation for diffusing a knowledge of the proceedings of the tribunal; a knowledge of the cases investigated, the allegations made, the evidence adduced, the sentence pronounced, and the reasons upon which it is grounded.

The book of the law of nations, and selections from the book of the trials before the international tribunal, should form a subject of study in every school, and a knowledge of them a necessary part of every man's education. In this manner a moral sentiment would grow up, which would, in time, act as a powerful restraining force upon the injustice of nations, and give a wonderful efficacy to the international jurisdiction. No nation would like to be the object of the contempt and hatred of all other nations; to be spoken of by them on all occasions with disgust and indignation. On the other hand, there is no nation which does not value highly the favourable sentiments of other nations; which is not elevated and delighted with the knowledge that its justice, generosity, and magnanimity, are the theme of general applause. When means are taken to make it certain, that what affords a nation this high satisfaction will follow a just and beneficial course of conduct, that what it regards with so much aversion will infallibly happen to it if it fails in the propriety of its own behaviour, we may be sure that a strong security is gained for a good intercourse among nations.

Besides this, it does not seem impossible to find various inconveniences, to which, by way of penalties, those nations might be subjected, which refused to conform to the prescriptions of the international code.

Various privileges granted to other nations, in their intercourse with one another, might be withheld from that nation which thus demeaned itself in a way so contrary to the general interests. In so far as the withholding of these privileges might operate unfavourably upon individuals belonging to the refractory nations, individuals who might be little, or not at all, accessory to the guilt, the effect would be the subject of proportional regret. Many, however, in the concerns of mankind, are the good things which can only be attained with a certain accompaniment of evil. The rule of wisdom, in such cases, is, to make sure that the good outweighs the evil, and to reduce the evil to its narrowest dimensions.

We may take an instance first from trivial matters. The ceremonial of other nations might be turned against the nation, which, in this common concern, set itself in opposition to the interests of others. The lowest place in company, the least respectful situation on all occasions of ceremony, might be assigned to the members of that nation, when travelling or residing in other countries. Many of those marks of disrespect, implying injury neither to person nor property, which are checked by penalties in respect to others, might be free from penalties in respect to them. From these instances, adduced merely to illustrate our meaning, it will be easy to see in what manner a number of considerable inconveniences might, from this source, be made to bear upon nations refusing to conform to the beneficial provisions of the international code.

Besides the ceremonial of other nations, means to the same end might be derived from the law. A number of cases might be found in which certain benefits of the law, granted to other foreigners, might be refused to them. They might be denied the privilege of suing in the courts, for example, on account of any thing except some of the higher crimes, the more serious violations of person or property.

Among other things, it is sufficiently evident that this tribunal would be the proper organ for the trial of piracy. When preponderant inconvenience might attend the removing of the trial to the usual seat of the tribunal, it might delegate for that purpose the proper functionaries to the proper spot.

By the application of the principles which we have thus expounded, an application which implies no peculiar difficulty, and requires nothing more than care in the detail, we are satisfied that all might be done, which is capable of being done, toward securing the benefits of international law. (A. A. A.)

Law-Language. In England all law proceedings, as indeed public proceedings of all kinds, were formerly conducted in Norman-French, and even the arguments of the counsel and decisions of the court were delivered in the same barbarous dialect; an evident and shameful badge of tyranny and foreign servitude, having been introduced under the auspices of William the Norman and his sons, and by which the sneer of the Roman satirist was once more verified, *Gallia causidicos docuit facunda Britannos.* This continued till the reign of Edward III. who, having employed his arms successfully in subduing the kingdom of France, thought it unbecoming the dignity of the victors to use any longer the language of a vanquished country. By a statute passed in the thirty-sixth year of his reign, it was therefore enacted, that for the future all pleas should be pleaded, shown, defended, answered, debated, and judged, in the English tongue, but should be entered and enrolled in Latin; in the same manner as Don Alonso X. king of Castile, the great-grandfather of our Edward III., obliged his subjects to use the Castilian tongue in all legal proceedings, and as, in the year 1286, the German language was established in the courts of the empire. And if our legislature had then directed that the writs themselves, which are mandates from the king to his subjects, enjoining them to perform certain acts, or to appear at certain places, should be framed in the English language, according to the rule of our ancient law, it would have been a still further improvement. But the record or enrolment of these writs, and the proceedings thereon, being calculated for the benefit of posterity, was more serviceable, because more durable, in a dead and immutable language than in a living and fluctuating one. The practitioners, however, being used to the Norman language, and therefore imagining that they could express their thoughts more aptly and more concisely in that than in any other, still continued to take their notes in Norman-French; and when those notes came to be published, under the denomination of *reports*, they were of course printed in that barbarous dialect, which, joined to the additional terrors of a Gothic black letter, has occasioned many a student to throw away his Plowden and Littleton, without venturing to attack a page of them. Yet, upon a nearer acquaintance, they would in reality have found nothing very formidable in the language, which differs in its grammar and orthography as much from the modern French, as the diction of Chaucer and Gower differs from that of Pope and Addison. Besides, as the English and Norman languages were concurrently used by our ancestors for several centuries together, the two idioms naturally assimilated by a reciprocal interchange; and for this reason the grammatical construction of each is so much the same, that an Englishman, with a week's preparation, could understand the laws of Normandy, collected in their *Grand Coustumier*, as well as, if not better than, a Frenchman bred within the walls of Paris.

The Latin, which succeeded the French for the entry and enrolment of pleas, and which continued in use for four centuries, answers so nearly to the English, that it is not at all surprising that it should generally be imagined to have been totally fabricated at home, with little more art or trouble than by adding Roman terminations to English words. But in reality it was an universal dialect, spread throughout all Europe, at the irruption of the northern nations, and accommodated and moulded to the purposes of lawyers with peculiar exactness and precision. This is principally owing to the simplicity, or, it may be, the poverty and baldness of its texture, being calculated to express the ideas of mankind just as they arise in the human mind, without any rhetorical flourishes or perplexed ornaments of style. For it may be observed that those laws and ordinances are generally the most easily understood, in compiling which, strength and perspicuity, not harmony or elegance of expression, have been principally consulted. These northern nations, or rather their legislators, though they resolved to make use of the Latin tongue in promulgating their laws, as being more durable and more generally known than their own Teutonic dialects, yet, either through choice or necessity, they frequently intermixed therein some words of Gothic origin; a circumstance which is more or less the case in every country of Europe, and therefore not to be imputed as any peculiar blemish in English legal latinity. The truth is, that what is generally denominated Law-Latin is in reality a mere technical language, calculated for eternal duration, easy to be apprehended both in present and future times, and on these accounts best suited to preserve the memorials which are intended for perpetual rules of action. The rude pyramids of Egypt have endured from the earliest ages, whilst the more modern and elegant structures of Attica, Rome, and Palmyra, have sunk beneath the wasting influence of time.

As to the objection of locking up the law in a strange and unknown tongue, this is of little weight with regard to records, which few have occasion to read, but such as either do or ought to understand the rudiments of Latin. And besides, it may be observed of the Law-Latin, as Sir John Davis observes of the Law-French, " that it is so very easy to be learned, that the meanest wit that ever came to the study of the law doth come to understand it almost perfectly in ten days without a reader."

It is true, indeed, that the many terms of art with which the law abounds are sufficiently harsh when latinized, and, as Mr Selden observes, may give offence " to some grammarians of squeamish stomachs, who would rather choose to live in ignorance of things the most useful and important, than to have their delicate ears wounded by the use of a word unknown to Cicero, Sallust, or the other writers of the Augustan age." Yet this is only what must unavoidably happen when things of modern use, of which the Romans had no idea, and consequently no phrases to express them, come to be delivered in the Latin tongue. It would puzzle the most classical scholar to find an appellation, in pure latinity, for a constable, a record, or a deed of feoffment; and it is therefore to be imputed as much to necessity as ignorance, that they were styled in our forensic dialect, *constabularius, recordum,* and *feoffamentum.* Thus, again, another uncouth word of our ancient laws, the substantive *murdrum,* or the verb *murdrare,* however harsh and unclassical it may sound, was necessarily framed to express a particular offence, since no other word in being, *occidere, interficere, necare,* or the like, was sufficient to express the intention of the criminal, or *quo animo* the act was perpetrated, and therefore by no means came up to the notion of murder at present entertained by law, viz. killing or slaying with malice aforethought.

A similar necessity produced a similar effect at Byzantium when the Roman laws were converted into Greek for the use of the oriental empire; for, without any regard to Attic elegance, the lawyers of the imperial courts made no scruple to translate *fidei commissarios,* φιδει κομμισσαϱιους; *cubiculum,* κουβουκλειον; *filium-familias,* παιδα-φαμιλιας; *repudium,* ϱεπουδιον; *compromissum,* κομπϱομισσον; *reverentia et obsequium,* ϱευεϱεντια και οβσεκουιον; and so in many other instances. They studied more the exact and precise import of the words, than the neatness and delicacy of their cadence. And it may be suggested, that the terms of the law are not more numerous, more uncouth, or more difficult to be explained by a teacher, than those of logic, physics, and the whole circle of Aristotle's philosophy, nay, even of the more polite art of architecture and its kindred studies, or the science of rhetoric itself. Sir Thomas More's famous legal question contains in it nothing more difficult than the definition which in his time the philosophers currently gave of their *materia prima*, the groundwork of all natural knowledge, that it is "neque quid, neque quantum, neque quale, neque aliquid eorum quibus ens determinatur;" or than the subsequent explanation given by Adrian Heereboard, who assures us that "materia prima non est corpus, neque per formam corporeitatis, neque per simplicem essentiam: est tamen ens, et quidem substantia, licet incompleta; habetque actum ex se entitativum, et simul est potentia subjectiva." The law, therefore, with regard to its technical phrases, stands upon much the same footing with other studies, and requires only the same indulgence.

This technical Latin continued in use from the time of its first introduction till the subversion of the ancient constitution under Cromwell, when, amongst many other innovations, the language of our records was altered and converted into English. But at the restoration of Charles II. this novelty was no longer countenanced, the practitioners finding it very difficult to express themselves concisely or significantly in any other language than the Latin. And thus it continued without any sensible inconvenience until about the year 1730, when it was again thought proper that all proceedings at law should be in English, and it was accordingly so ordered by statute 4 Geo. II. c. 26. This was done in order that the common people might have knowledge and understanding of what was alleged or done for and against them in the process and pleadings, the judgment and entries in cause. It is doubtful how far this has answered the purpose; for there is reason to suspect that the people are now, after many years' experience, altogether as ignorant in matters of law as before. On the other hand, certain inconveniences have already arisen from the alteration. Many clerks and attorneys are now hardly able to read, much less to understand, a record even of so modern a date as the reign of George I. It has also enhanced the expense of all legal proceedings. For, since the practitioners are confined to write only a stated number of words in a sheet, and as the English language, through the multitude of its particles, is much more verbose than the Latin, it follows that the number of sheets must be greatly augmented by the change. The translation also of technical phrases, and the names of writs and other process, were found to be so very ridiculous (a writ of *nisi prius*, *quare impedit*, *fieri facias*, *habeas corpus*, and the rest, not being capable of an English dress with any degree of seriousness), that in two years it was found necessary to make a new act, 6 Geo. II. c. 14, which allows all technical words to continue in the usual language, and has thereby defeated every beneficial purpose of the former statute.

LAW, JOHN, commonly known by the name of the Projector, was the eldest son of William Law, and was born at Edinburgh in the month of April 1671. His father followed the profession of goldsmith or banker, with so much success, that he was enabled to purchase the lands of Lauriston and Randleston, which afterwards descended to his son. The latter was educated at Edinburgh, where he is said to have made some progress in literature; but the bent of his genius having led him to study arithmetic and geometry, he attained such proficiency in these branches, as to be able to solve with facility the most intricate problems; and he likewise made himself master of algebra. The principles of public and private credit, the state of trade and of manufactures, the theory and practice of taxation, and other matters connected with political economy, also engaged his attention; and the accession of knowledge resulting from these inquiries laid the foundation of his future eminence. But he soon became noted as a man of pleasure as well as of study. Having lost his father before he had completed his fourteenth year, he was thus left at an early age without paternal control; and as the graces of a naturally handsome person were improved by the acquisition of external accomplishments, Jessamy John, or Beau Law, as he was indifferently called by his companions, addicted himself to the practice of all games of chance, skill, and dexterity, and appears to have engaged in other pursuits of a still more questionable character. In 1694, he visited London, where his wit and accomplishments procured him admission into the first circles, whilst his extravagance speedily involved him in difficulties. At this time he was noted for his propensity to deep play, and for his gallantries amongst women. By the former, he injured his fortune; in consequence of the latter, he narrowly escaped an ignominious end. An intrigue which he had with a Mrs Lawrence proved the occasion of a quarrel between him and one Mr Edward Wilson; a hostile meeting ensued, and Mr Law killed his antagonist on the spot. He was immediately apprehended, and brought to trial at the Old Bailey, on a charge of murder; and being found guilty, received sentence of death. Upon a representation of the case to the crown, however, Law obtained a pardon; but an appeal being lodged by a brother of the deceased, he was detained in the King's Bench prison. This appeal was brought before the court of King's Bench in Trinity-term 1694; and as the exceptions taken on the part of Law were overruled by the court, the latter, judging it prudent not to await the result, found means to escape from prison,[1] and retired to the Continent.

During his stay abroad, he acted for some time as secretary to the British resident in Holland, and occupied himself in improving his knowledge of financial operations, and particularly in making himself acquainted with the constitution and practical operation of the bank of Amsterdam. He returned to his native country in 1700, and in that year appears to have written his *Proposals and Reasons for Establishing a Council of Trade*, which was published at Edinburgh early in 1701. His project met with no encouragement; but the publication had the effect of making him known to some of the principal personages of the country, including the Duke of Argyll, his sons the Marquis of Lorn and Lord Archibald Campbell, the Marquis of Tweeddale, and other persons of distinction. Relying upon the support of these noblemen, he offered to the Scottish parliament, in 1705, a plan for removing the difficulties under which the kingdom then laboured from the scarcity of specie, and the stoppage of payments by the bank; and, with a view to further his object, he published another work, entitled *Money and Trade considered, with a Proposal for Supplying the Nation with Money*, which appeared at Edinburgh the same year. His "proposal" was, that commissioners, to be appointed by an act, under the control of parliament, should be empowered to issue notes, either in the way of loan, at ordinary interest, upon landed security, the debt, however, not to exceed half, or at the most two thirds, of the value of the land; or upon land-pledges, redeemable within a certain period, to the full value of the land; or, lastly, upon sale irredeemably to the amount of the price agreed upon. Paper-money, thus issued and secured, would, he conceived, be equal in value to gold and silver money of the same denomination, and might even be preferred to these metals, as not being, like them, liable to fall in value. But this scheme, though supported by the united weight of the court party, and of that called the *squadrone*, headed by the Duke of Argyll and the Marquis of Tweeddale, was rejected by the parliament, which resolved, "that to establish any kind of paper-credit, so as to oblige it to pass, was an improper expedient for the nation." The rejection of the plan was occasioned by an apprehension, that if it were adopted, all the estates of the kingdom would thereby be brought to a complete dependence upon the government.

---

[1] In the London Gazette of Monday, 7th January 1695, a reward of fifty pounds was offered for the apprehension of "*Captain* John Law, a Scotchman, lately a prisoner in the King's Bench for murther," who is described as "a very tall, black, lean man, well shaped, above six foot high, large pock-holes in his face, big high nosed, speaks broad and loud." This description, which conveys no very favourable idea of Law's personal appearance, and differs from his real portrait, is supposed by Mr Wood to have been drawn up with a view to facilitate his escape. The prefix of "Captain," which is otherwise a good travelling title, may also, perhaps, be explained on the same hypothesis.

Mr Law now resolved to abandon his native country, and to try his fortune abroad. He resided some time at Brussels, where he became noted for extraordinary success at play; and in two excursions which he made to Paris, his good fortune at the gaming-table became still more conspicuous. Having visited the principal cities of Italy, he continued the same career, playing at all sorts of games, and betting and speculating in the public funds and banks, with uninterrupted success; insomuch that, in the year 1714, he was worth upwards of L.110,000 sterling. During these rambles, Law, having the advantage of a graceful figure and an insinuating address, was everywhere well received by persons of the highest quality. At Florence he became acquainted with the Duke de Vendôme, whom he had the honour to oblige with the loan of a considerable sum of money. At Neufchâtel he obtained access to the Prince of Conti, to whom he imparted some of his financial projects. During a short residence at Turin, he communicated to Victor Amadeus, king of Sardinia, a scheme for aggrandising his territories, of the same nature as that which he afterwards proposed to the Duke of Orleans; but the prudent monarch declined embarking in so perilous an adventure, observing to the projector, that his dominions were too small for the execution of so great a design, and that France was the proper theatre for such speculations. "If I know the disposition of the people of that country," added Victor Amadeus, "I am sure they will relish your schemes; and therefore I would advise you to go thither without delay."

Law took the advice which was thus given him, and returned to Paris, where he arrived in 1714, not long before the death of Louis XIV. He was more favourably received than on the occasions of his former visits, when he appears to have been regarded as a mere adventurer; and soon gained the confidence of the Duke of Orleans to such a degree, that he was not only admitted to the convivial parties of the regent, but even nominated one of his counsellors of state. At this time the French finances were in the greatest disorder, indeed in a situation accounted desperate; the nation was burthened with an immense load of debt, contracted during the expensive wars of Louis XIV.; and the people groaned under the intolerable pressure of the taxes which had been imposed for payment of the interest. All industry was thus checked, and trade in a manner annihilated; manufactures, commerce, and navigation, had almost ceased; the merchant and the trader were reduced to beggary, and the artificer was compelled, for want of employment, to leave the kingdom. In a word, the state of affairs was such, that it had been debated in council, and actually proposed to apply a spunge to the debt, and to seek relief by means of a national bankruptcy. The proposal, however, was rejected by the regent, and a commission appointed to inquire into the claims of the state creditors, and endeavour to introduce some degree of order into the public finances. At this calamitous crisis, when the surplus of the public revenue, after payment of the interest of the debt, was found insufficient to defray the necessary expenses of the civil government, Law came forward with his favourite nostrum or panacea, and proposed to liquidate the debt, by establishing a bank for issuing notes secured upon landed property, and on the unalienable impledgement of all the royal revenues. The project seems to have been approved of, but as the conjuncture was thought unfavourable for risking so bold an experiment, his application proved ineffectual. Nothing discouraged, Law requested and obtained permission to establish a private bank, to consist entirely of funds advanced by himself, and others who chose to embark in the undertaking. The letters-patent, which are dated the 2d and 20th of May 1716, specify the principles upon which the bank had been established, as well as the regulations according to which it was to be conducted. The scheme promised success, and, in fact, the General Bank of Law and Company had acquired great credit, when, in December 1718, it was dissolved by an arrêt of the regent, who, observing the advantages resulting from the establishment, resolved to take it into the hands of government; a resolution which could not be very agreeable to the founder and his associates in the enterprise. Law, however, was named director-general of the Royal Bank, in which his own had merged; and branches were established at Lyons, Rochelle, Tours, Orleans, and Amiens.

Law now began to develope the stupendous project he had long meditated, and which afterwards became so well known to all Europe, under the name of the Mississippi System. This scheme was nothing less than the vesting of the whole privileges, effects, and possessions of all the foreign trading companies, the great farms, the mint, the general receipt of the king's revenues, and the management and property of the bank, in one great company, who, having thus in their hands all the trade, taxes, and royal revenues, might be enabled to multiply the notes of the bank to any extent they pleased, doubling or even tripling at will the circulating medium of the kingdom, and, by the immensity of their funds, possessed of a power to carry the foreign trade and the improvement of the colonies to a height altogether unattainable by other means. This monstrous and impracticable monopoly was approved of by the regent, and by letters-patent a commercial company was established, under the name of the Company of the West; to which was at the same time granted the whole province of Louisiana, a country watered throughout its whole extent by the Mississippi, from which the project accordingly took its name. The scheme was well calculated to entrap the unwary and to seduce the speculative. Of this company 200,000 actions or shares were issued, at 500 livres each, and the subscriptions were made payable in a depreciated paper-currency, called *billets d'état*, which, however, in the subscriptions, was taken at its full value. This could not fail to operate as a tempting bait to the holders of these billets or notes to lay them out in the purchase of shares, especially since the depreciation amounted to between sixty and seventy per cent. The company thus became creditors of the king to the extent of a hundred millions of livres, the interest of which sum was fixed at the rate of four per cent.

Law, who had now advanced high in the regent's favour, was of course named director-general of the Company of the West, and thus intrusted with the development of his own stupendous project. Louisiana having been represented as a region abounding in gold and silver, and possessing a fertile soil capable of the highest cultivation, the actions or shares were bought up with the greatest avidity; and such was the rage for speculation, that the unimproved parts of the colony were actually sold for 30,000 livres the square league. In pursuance of the scheme, the farm of tobacco was made over to the company at an advance of rent exceeding two millions of livres. Soon afterwards they acquired the charter and effects of the Senegal Company; and this was succeeded by a still more important acquisition, namely, the exclusive privilege of trading to the East Indies, China, and the South Seas, together with all the possessions and effects of the China and India companies, now dissolved, upon the condition of liquidating all just claims against them. Upon this occasion, the Company of the West assumed the title of Company of the Indies; and 50,000 new shares were ordered to be constituted, at 550 livres each, payable in coin. The price of actions quickly rose to 1000 livres each. On the 25th of July 1719, the mint was made over to this company for a consideration of fifty millions of livres, to be paid to the king within fifteen months; on the 27th of August following, the regent took out of the hands of the farmers-general, and made over to them, the great farms, for which they agreed to pay an advance of rent of three millions and a half of livres; and, on the 31st of the same month, they also obtained the general receipt or collection of the other branches of the king's revenue. Having acquired all these grants, and thus concentrated in themselves not only the whole foreign trade and possessions of France, but also the collection and management of the royal revenues, they promised an annual dividend of 200 livres on every share; the price of actions instantly rose in the market to 5000 livres; and the public ran with such eagerness upon the last creation of stock, that nearly double the requisite sum was subscribed, whilst the greatest interest was exerted, and every stratagem put in practice, to secure places in that subscription. The frenzy now became general. A rage for the acquisition of shares in the India Company seized and infatuated all ranks in the kingdom. Clergy and laity, peers and plebeians, princes and peasants, statesmen and magistrates, nay, even ladies, all, in short, who either had or could procure money for the purpose, turned stockjobbers, outbidding each other with such avidity, that in November 1719, the price of shares rose to above 10,000 livres, or (when the depreciation of the *billets d'état* is taken into account) more than sixty times the sum they originally sold for. Nothing was talked of but actions; every place echoed with Mississippi and Quinquempoix.[1] All classes appeared to have but one object, one pursuit. Mechanics laid aside their work, tradesmen forsook their shops, and persons of all grades neglected their professions or employments, to embark in this new occupation; whilst even the few who observed some degree of moderation, showed by their conduct how little concern they took in affairs foreign to the Mississippi scheme.[2] The delirium had reached its culminating point.

Mr Law now blazed a meteor of unequalled splendour. He possessed the ear of the Duke of Orleans; he was almost adored by the people, ever ready to worship at the shrine of the idol of the hour; and he was surrounded by princes, dukes, peers, marshals, and prelates, who all courted his friendship, and even seemed ambitious of his patronage. Nobles were content to wait in his antechambers, like the meanest subjects; and ladies of the highest quality employed every artifice, sometimes at the risk of their necks, to attract his passing notice.[3] The property which he acquired was immense. He purchased no less than fourteen estates with titles annexed to them, and amongst these the marquisate of Rosny, which had belonged to the illustrious Sully, the friend and minister of Henry IV. About this period, too, a free pardon for the murder of Mr Wilson was conveyed to him from England; and Edinburgh, proud of having produced so great a personage, transmitted to him the freedom of the city in a gold box. By his abjuration of the Protestant religion, the only obstacle which stood in the way of his advancement to the highest offices in the state was soon afterwards removed; and, on the 5th of January 1720, he was appointed comptroller-general of the finances. A few days previous to this, the Academy of Sciences had elected him one of its honorary members; and the flattering incense of poetry was offered up at the same shrine with the homage of an infatuated people. Thus the astonished world beheld an obscure foreigner, of doubtful reputation and questionable character, rise in a few months from a private condition to the high station of prime minister of France, and govern for a time, with almost absolute power, one of the greatest and most enlightened nations of Europe. It might well be said of him, *Tollitur in altum ut casu graviore cadat.*

But after having raised himself to such an unexampled eminence, Law at length fell a sacrifice to the intrigues of the other ministers, who, partly from envy, and partly from apprehension, combined with ignorance, undermined the insecure fabric he had reared, and thus precipitated its fall. The credit of the bank and of the India Company had attained its height in November 1719, when shares of the latter sold for more than 10,000 livres each, and money was so abundant in the former that the directors agreed to lend any sum upon proper security at two per cent. But amidst the general delirium, there were symptoms which evidently betokened an approaching revulsion. The most alarming of these was a constant drain of specie from the bank, either for the purpose of being hoarded or sent abroad. Astonished at their exorbitant gains, the original proprietors of the company thought only of converting their shares into gold, and realizing the fortunes which they had so suddenly acquired; and it was computed that not less than 500 millions of livres, the property of persons of this description, had been sent out of France. To avert the danger which thus threatened the system, several edicts were issued early in 1720, by which payments in specie were restricted to small sums, and the standard of the coin was kept in continual fluctuation, whilst bank-notes were declared to remain invariable, and rents, taxes, and customs, were made payable in notes. But what crowned all, was the edict of the 27th February 1720, prohibiting individuals, as well as secular or religious communities, from having in their possession more than 500 livres in specie, under the penalty of a fine, and confiscation of all sums found exceeding that amount; a measure which could scarcely fail to sow distrust in the bosom of families, and to excite alarm in the public mind. Still the delusion prevailed. On the 23d of February, a few days before the publication of this edict, the Royal Bank had been incorporated with the company, and the king not only remained guarantee of the bank-notes, but gave up to the company all the profits made by the bank since December 1718, when the government had taken it into its own hands. Meanwhile, the manufacture of notes proceeded with so much activity, that, by the 1st of May 1720, paper-money had been fabricated to the amount of more than 2600 millions of livres, or nearly L.110,000,000 sterling; whilst the specie in the kingdom was estimated at only 1300 millions of livres, or about L.52,000,000 sterling. In this state of matters, Cardinal Dubois and M. d'Argenson represented to the regent that it had become necessary to equalize the proportion between the notes and the coin, either by reducing the value of the one to the extent of a half, or by doubling that of the other.

---

[1] The street where the stockjobbing was at first carried on.

[2] The unexampled rise in the price of actions enabled obscure and humble individuals to acquire at once princely fortunes; and many amusing anecdotes are told of persons thus suddenly raised to affluence. A footman having realised a large sum, provided himself with a carriage; but the first day it drew up at his door, obeying the instinctive habit of his calling, he, instead of stepping into the vehicle, mounted up to his old station behind it. Another of the same fraternity, who had obeyed the like familiar impulse, endeavoured adroitly to cover his mistake by pretending that he got up merely to see if there was room at the back for two or three more lacqueys, whom he was resolved to hire instantly. Law's coachman had made so great a fortune that he asked a dismission from the service of his master, which was granted, on condition of his procuring another as good as himself. Cook-maids and waiting-women appeared at the opera bedizzened with jewels and finery; many who had not a dozen livres in the world suddenly "tumbled from a garret into a carriage;" and the son of a baker at Toulouse, being desirous of having a superb service of plate, purchased the contents of a goldsmith's shop for 400,000 livres, and sent them home to his wife, with orders to set them out properly for supper. In a word, property underwent a new and most grotesque distribution.

[3] The regent's mother asserts, in one of her letters, that "si Laws le vouloit, les femmes Françoises lui baiseroient la derrière;" a strong expression, certainly, but one which shows that all ideas of delicacy, or even decency, were absorbed by the cupidity and avarice which had taken possession of the public mind.

This extraordinary point was debated in council, where it was opposed by some of the members, amongst whom was the comptroller-general, who strenuously contended for letting matters remain as they were; but the majority being in favour of the proposition for lowering the value of the paper, it was decided accordingly; and, on the 21st of May 1720, an edict was issued, which, contrary to all sound policy, and even to the most solemn stipulations, reduced the value of the company's bank-notes one half, and fixed their actions or shares at 5000 livres. By this unjustifiable and fatal step, the whole paper fabric was destroyed in an instant, the notes lost all credit, and next day a man might have starved with 100 millions of paper money in his pocket. The consternation with which all ranks were seized was soon converted into rage, and it became necessary to station troops in different parts of the capital, to prevent the consequences to be apprehended from the fury and despair of the populace. Disorder and confusion reigned everywhere; seditious and inflammatory libels were posted up and distributed; and the life of the regent himself was threatened.[1] Some conception may be formed of the distress of the people, when it is considered that at the time when the bank thus stopped payment, and the value of paper money instantly sunk to zero, not less than 2,235,085,590 livres, or upwards of L.90,000,000 sterling in notes, were in circulation. Law was of course peculiarly obnoxious to popular odium, which he endeavoured in vain to allay by resigning into the hands of the regent his office of comptroller-general, on the 29th of May; but, though several times exposed to imminent danger, from the vengeance both of the parliament and the people, he remained in France until towards the close of the year 1720, when he withdrew to Brussels; and soon afterwards his whole property was confiscated, and his brother William sent to the Bastile.

Law arrived at Brussels on the 22d of December 1720, and, after waiting there for some time, in the vain expectation of being recalled to France, set out for Venice, which he reached early in January 1721; he then visited other places on the Continent, and, in October, arrived in England, for the ostensible purpose of pleading the king's pardon. He was at first well received, and visited by persons of distinction; but when it was discovered that the fallen financier was in a state almost bordering upon destitution, his friends began to fall off, and, of those who had known or perhaps courted him in his day of power, he could find none good-natured enough to lend him a thousand pounds. In a letter addressed to Mrs Howard, afterwards Countess of Suffolk, he calls that lady his "only friend;" an avowal which affords a striking instance of the instability of fortune, power, and friendship. After residing some years in England, this extraordinary man returned once more to the Continent, and closed his chequered career at Venice, where, on the 21st of March 1729, he died in a state but little removed from indigence, in the fifty-eighth year of his age. Soon after his death appeared the following epitaph, the point of which reminds us of the bitter jests which appeared upon the occasion of his fall:—

Ci gît cet Ecossois célèbre,
Ce calculateur sans égal,
Qui, par les règles de l'algèbre,
A mis la France à l'hôpital.

We do not think that any great difference of opinion can now be entertained respecting the real character of Law's project; and indeed it seems to be generally agreed that, even if it had not been violently interrupted by the edict of the regent, it was too insecure in its principles to have proved permanent. The favourite maxim inculcated by Law, and upon which his whole fabric of the Mississippi system was reared; namely, that the power and prosperity of a nation increase in proportion to the quantity of money circulating therein, and that, as the richest nations have not specie sufficient to afford full employment to their inhabitants, this defect may be supplied by paper credit; involves a dangerous fallacy, even in the most restricted view that can be taken of its application, inasmuch as it implies that paper money may be issued with advantage to an almost unlimited extent, upon general security; and that its credit, or, in other words, its value, may thus be maintained without its being rendered convertible at pleasure into cash. But all experience has proved that this is absolutely impossible. When paper is in excess, in comparison with the total amount of gold and silver currency, it necessarily becomes depreciated; the prices of commodities experience a corresponding rise; the nominal value of the precious metals is increased in proportion to the amount of the depreciation, of which this increase is the only measure, and they disappear from circulation. All existing contracts and obligations are disturbed; debtors benefited at the expense of creditors; a spirit of reckless speculation and adventure is thus engendered; and, after a time, the crisis of revulsion and ruin arrives. Whenever the quantity of money in circulation is too great in propor-

---

[1] Even in this season of calamity, the French exemplified the indestructible gaiety of their national character, by sporting with their own misfortunes in jests and epigrams. The following hebdomadal record is, perhaps, unique amongst *jeux d'esprits.*

Lundi j'achetai des actions;
Mardi je gagnai des millions;
Mercredi j'arrangeai mon ménage;
Jeudi je pris un équipage;
Vendredi je m'en fus au bal;
Et Samedi à l'hôpital.

The Abbé, afterwards Cardinal, de Tencin, having had the principal share in Mr Law's conversion, a service for which he was rewarded by the bishopric of Grenoble, is thus addressed by a malicious epigrammatist:—

Foin de ton zèle séraphique,
Malheureux Abbé de Tencin!
Depuis que Laws est Catholique,
Tout le royaume est Capuçin.

Law, Edmund.

tion to the total amount of commodities to be circulated by it, depreciation is the necessary consequence, or, in other words, a proportional rise in the price of commodities. Money has no creative power, as Law seems all along to have imagined, and can never be in excess without endangering "the power and prosperity" of the nation where this is the case. His whole system, therefore, was built upon a sandy foundation, and, even if it had received no rude or sudden shock, would have fallen to pieces from its own insecurity and instability. At the same time, there is much truth in an observation of Mr Burke, in his *Reflections on the French Revolution.* "It is not true," says he, "that Law built solely on a speculation concerning the Mississippi; he added the East India trade, he added the African trade, he added the farms of all the farmed revenue of France; all these unquestionably could not support the structure which the public enthusiasm, not he, chose to build on these bases." He laid the best foundation that he could, perhaps the best which, in the circumstances, it was possible to lay; but the nation went suddenly mad, an event which he could scarcely have foreseen; the company was hurried onwards by the general frenzy; and when the delirium had reached its height, the regent was advised to issue the fatal edict, which levelled the whole fabric with the dust.

(See *Œuvres de Law,* passim; *Histoire du Système des Finances,* tom. i.; Pollnitz, *Mémoires;* Massillon, *Mémoires de la Minorité de Louis XV.; Mémoires de la Regence de M. le Duc d'Orleans,* tom. i.; Richelieu, *Mémoires,* tom. iii.; Voltaire, *Siècle de Louis XV.;* Chalmers's *Biog. Dict.* art. LAW; Wood, *Life of John Law of Lauriston,* Edinburgh, 1824.) (A.)

LAW, *Edmund,* bishop of Carlisle, was born in the parish of Cartmel, in Lancashire, in the year 1703. His father, who was a clergyman, held a small chapel in that neighbourhood; but the family had been situated at Askham, in the county of Westmoreland. He was educated for some time at Cartmel school, and afterwards at the free grammar-school of Kendal, from which he went, well instructed in the learning of grammar-schools, to St John's College in Cambridge.

Soon after taking his first degree, he was elected fellow of Christ College in that university. During his residence in this college, he became known to the public by a translation of Archbishop King's *Essay on the Origin of Evil,* with copious notes; in which many metaphysical subjects, curious and interesting in their own nature, are treated of with ingenuity, learning, and novelty. To this work was prefixed, under the name of a preliminary dissertation, a very valuable piece, written by the Reverend Mr Gay of Sidney College. He also, whilst at Christ College, undertook and went through a laborious task, in preparing for the press an edition of Stephens's *Thesaurus.* His acquaintance, during this his first residence in the university, was principally with Dr Waterland, the learned master of Magdalen College; Dr Jortin, a name known to every scholar; and Dr Taylor, the editor of the *Demosthenes.*

In the year 1737 he was presented by the university to the living of Graystock in the county of Cumberland, a rectory of about L.300 a year. The advowson of this benefice belonged to the family of the Howards of Graystock, but devolved to the university, for this turn, by virtue of an act of parliament, which transferred to these two bodies the nomination to such benefices as appertained, at the time of the vacancy, to the patronage of a Roman Catholic. The right, however, of the university was contested; and it was not until after a law-suit of two years' continuance that Mr Law was settled in his living. Soon after this, he married a daughter of Mr John Christian of Unerigg, in the county of Cumberland.

In 1743, he was promoted by Sir George Fleming, bishop of Carlisle, to the archdeaconry of that diocese; and in 1746 he went from Graystock to reside at Salkeld, a pleasant village upon the banks of the river Eden, the rectory of which is annexed to the archdeaconry. Mr Law was not one of those who lose and forget themselves in the country. During his residence at Salkeld, he published Considerations on the Theory of Religion; to which were subjoined, Reflections on the Life and Character of Christ, and an appendix concerning the use of the words Soul and Spirit in Holy Scripture, and the state of the Dead there described.

At this time Dr Keene held, with the bishopric of Chester, the mastership of Peterhouse in Cambridge. Desiring to leave the university, he caused Dr Law to be elected to succeed him in that station. This took place in the year 1756, in which Dr Law resigned his archdeaconry in favour of Mr Eyre, a brother-in-law of Dr Keene. Two years before this, he had taken his degree of doctor of divinity, in his public exercise for which, he defended the doctrine of what is usually called the "sleep of the soul."

About the year 1760, he was appointed principal librarian of the university; a situation which, as it procured him an easy access to books, was peculiarly agreeable to his taste and habits. Some time after this, he was also appointed casuistical professor. In the year 1762, he suffered an irreparable loss by the death of his lady. Some years afterwards, he received several preferments, which were rather honourable expressions of regard from his friends, than of much advantage to his fortune.

Dr Cornwallis, then bishop of Litchfield, afterwards archbishop of Canterbury, who had been his pupil at Christ College, appointed him to the archdeaconry of Staffordshire, and to a prebend in the church of Litchfield. Dr Green, bishop of Lincoln, his old acquaintance, made him a prebendary of that church. In the year 1767, he obtained a stall in the cathedral church of Durham, by the intervention of the Duke of Newcastle, to whose interest, in the memorable contest for the high stewardship of the university, he had adhered, in opposition to some strong temptations. The year after this, the Duke of Grafton, who had a short time before been elected chancellor of the university, recommended the master of Peterhouse to his majesty for the bishopric of Carlisle. This recommendation was made not only without solicitation on his part or on that of his friends, but without his knowledge, until the duke's intention in his favour was signified to him by the archbishop.

About the year 1777, Bishop Law gave to the public a handsome edition, in three volumes quarto, of the works of Mr Locke, with a Life of the Author, and a Preface. Mr Locke's writings and character he held in the highest esteem, and seems to have drawn from them many of his own principles. He was a disciple of that school. About the same time he published a tract, which attracted some attention, on the controversy concerning subscription; and he published new editions of his two principal works, with considerable additions, and some alterations.

Dr Law held the see of Carlisle for nearly nineteen years, during which time he twice only omitted spending the summer months in his diocese at the bishop's residence at Rose Castle; a situation with which he was much pleased, not only on account of the natural beauty of the place, but because it restored him to the country in which he had spent the best part of his life. In the year 1787, he paid this visit in a state of great weakness and exhaustion, and died at Rose Castle about a month after his arrival there, on the 14th of August, being then in the eighty-fourth year of his age.

The life of the Bishop of Carlisle was a life of incessant reading and thought, almost entirely directed to metaphysical and religious inquiries. Besides the works already mentioned, he published, in 1734 or 1735, a very ingenious Inquiry into the Ideas of Space and Time, in which he

Law, William.

combats the opinions of Dr Clarke and his adherents on these subjects; but the tenet by which his name and writings are principally distinguished is, "that Jesus Christ, at his second coming, will, by an act of his power, restore to life and consciousness the dead of the human species, who, by their own nature, and without this interposition, would remain in the state of insensibility to which the death brought upon mankind by the sin of Adam had reduced them." He interpreted literally that saying of St Paul (1 Cor. xv. 21), "As by man came death, by man came also the resurrection of the dead." This opinion had no other effect upon his own mind than to increase his reverence for Christianity, and for its divine founder. He retained it, as he did his other speculative opinions, without laying, as many are wont to do, an extravagant stress upon their importance, and without pretending to more certainty than the subject admitted of. No man formed his own conclusions with more freedom, or treated those of others with greater candour and equity. He never quarrelled with any person for differing from him, or considered that difference as a sufficient reason for questioning any man's sincerity, or judging meanly of his understanding. He was zealously attached to religious liberty, because he thought that it leads to truth; yet from his heart he loved peace. There was nothing in his elevation to his bishopric which he spoke of with more pleasure, than its being a proof that decent freedom of inquiry was not discouraged.

He was a man of great softness of manners, and of the mildest and most tranquil disposition. His voice was never raised above its ordinary pitch. His countenance seemed never to have been ruffled; it preserved the same kind and composed aspect, truly indicating the calmness and benignity of his temper. He had an utter dislike of large and promiscuous companies. Next to his books, his chief satisfaction was in the serious conversation of a literary companion, or in the company of a few friends. In this sort of society he opened his mind without reserve, and with a peculiar turn and sprightliness of expression. His person was low, but well formed; and his complexion fair and delicate. Except occasional interruptions by the gout, he had for the greater part of his life enjoyed good health; and, when not confined by that distemper, he was full of motion and activity. About nine years before his death, he was greatly enfeebled by a severe attack of the gout in his stomach, and, a short time afterwards, lost the use of one of his legs. Notwithstanding his fondness of exercise, he resigned himself to this change, not only without complaint, but without any sensible diminution of his cheerfulness and good humour. His fault was the general fault of retired and studious characters, too great a degree of inaction and facility in his public station. The modesty, or rather bashfulness, of his nature, together with an extreme unwillingness to give pain, rendered him sometimes less firm and efficient in the administration of authority than was requisite. But this is the condition of human frailty. There is an opposition between some virtues which seldom permits them to subsist together in perfection.

Law, *William*, the author of many pious works, some of which obtained great popularity, was born at King's-cliffe, Northamptonshire, in the year 1686. Having completed his school education, he entered Emmanuel College, Cambridge, in 1705; commenced bachelor in 1708; was elected a fellow of his college in 1711; and took his degree of master of arts in 1712. Soon after the accession of George I. being called upon to take the oaths, and sign the declaration prescribed by act of parliament, he refused, and in consequence vacated his fellowship in 1716, after which he was considered as a nonjuror. It appears that he had for some time officiated as a curate in London, but had obtained no ecclesiastical preferment. Soon after his resignation of his fellowship, he went to reside at Putney, as tutor to Edward Gibbon, father of the historian of the same name; but how long he remained in this situation has not been ascertained. In 1727, he founded at Cliffe an alms-house for the reception of two old helpless women, and a school for the instruction and clothing of fourteen girls. The money which he thus applied was, it seems, the gift of an unknown benefactor. Whilst standing at the door of a shop in London, he was accosted by a person he had never seen before, who, having inquired his name, as well as whether he was of King's-cliffe, and received a satisfactory answer on both points, put into his hands a sealed paper, containing a bank note for a thousand pounds. There is no evidence that this money was given him in trust for purposes of charity, and he is therefore fully entitled to the merit of having appropriated it for the benefit of the poor. It appears that, some time before 1740, he was instrumental in bringing about an intimacy between Mrs Hester Gibbon, the sister of his pupil, and Mrs Elizabeth Hutcheson, the widow of a gentleman of the Middle Temple. This circumstance, trifling as it may seem, decided the direction and character of his future life. These ladies, being of congenial sentiments, formed a plan of living together in the country, secluded from the world, and of assuming Mr Law as their chaplain, instructor, and almoner. With this view, they ultimately settled at King's-cliffe, in a house prepared for their reception by Mr Law, and which formed the only property that had been devised to him by his father. Here their whole income, after deducting necessary expenses, was employed in acts of beneficence to the needy and the afflicted, or in donations of larger amount to persons of a somewhat higher grade who had known better days, but whom misfortune had reduced to poverty. In this situation Law remained twenty years, and died on the 9th of April 1761, in the seventy-fifth year of his age.

Gibbon, in his *Miscellaneous Works*, has drawn the character of Law in the happiest manner, and for once commended a man of piety, not only without irony, but even with a feeling approaching to affection. "In our family," says the historian, "he left the reputation of a worthy and pious man, who believed all that he professed, and practised all that he enjoined. The character of a nonjuror, which he maintained to the last, is a sufficient evidence of his principles in church and state; and the sacrifice of interest to conscience will always be respectable. His theological writings, which our domestic connexion has tempted me to peruse, preserve an imperfect sort of life, and I can pronounce with more confidence and knowledge on the merits of the author. His last compositions are darkly tinctured by the incomprehensible visions of Jacob Behmen; and his discourse on the absolute unlawfulness of stage-entertainments is sometimes quoted for a ridiculous intemperance of sentiment and language. But these sallies of religious phrensy must not extinguish the praise which is due to Mr William Law as a wit and a scholar. His argument on topics of less absurdity is specious and acute, his manner is lively, his style forcible and clear; and, had not his vigorous mind been clouded by enthusiasm, he might be ranked with the most agreeable and ingenious writers of the times. While the Bangorian controversy was a fashionable theme, he entered the lists on the subject of Christ's kingdom, and the authority of the priesthood; against the *Plain Account of the Sacrament of the Lord's Supper*, he resumed the combat with Bishop Hoadly, the object of Whig idolatry and Tory abhorrence; and at every weapon of attack and defence, the nonjuror, on the ground which is common to both, approves himself at least equal to the prelate. On the appearance of the *Fable of the Bees*, he drew his pen against the licentious doctrine that private vices are public benefits, and morality as well as religion must join in his applause. Mr Law's master-work, the *Serious Call*, is still read as a popular and powerful book of devotion. His precepts are rigid, but they are founded on the gospel; his satire is sharp, but it is drawn from the knowledge of human life; and many of his portraits are not unworthy of the pen of La Bruyère. If he finds a spark of piety in the reader's mind, he will soon kindle it to a flame; and a philosopher must allow that he exposes, with equal severity and truth, the strange contradiction between the faith and practice of the Christian world."

Mr Law's works amount to nine volumes octavo, comprising, besides a collection of letters, sixteen distinct treatises, which, however, it is unnecessary to enumerate, seeing they are all printed together. Although Law is best known as a devotional writer, and there can be no doubt that his *Serious Call*, and *Christian Perfection*, have proved eminently useful in leading many to think in earnest of religion, yet his merits as a controversial writer are of a very high order, and, in respect of style, wit, and argument, his letters to Bishop Hoadly are amongst the finest specimens of polemical composition to be found in our language. (A.)

LAWLESS COURT, a court said to have been held annually on the King's Hill at Rochford, in Essex, on the Wednesday morning after Michaelmas day, at cock-crowing, where they whispered, and had no candle, nor any pen and ink, but only a coal. Persons who owed suit or service, and did not appear, forfeited double their rent every hour they were missing. This servile attendance, Camden informs us, was imposed on the tenants for conspiring at the like unseasonable hour to raise a commotion. The court belonged to the honour of Raleigh, and to the Earl of Warwick, and was called *lawless*, from its being held at an unlawful hour.

LAWN, in manufactures, a fine sort of linen, remarkable for being used in the sleeves of the clerical dress of bishops.

LAWRENCE, SIR THOMAS, a celebrated English painter, was born at Bristol, on the 13th of April 1769. His father, who kept an inn, first in Bristol, and afterwards in Devizes, made some pretensions to literary taste, and was in the habit of reciting poetry; an accomplishment which his son acquired at a very early age, as well as that of taking likenesses with striking fidelity. One of the earliest instances recorded of young Lawrence's genius is to be found in an incident which occurred to Lord and Lady Kenyon, some years previous to the time when the former was elevated to the peerage. Happening to remain for a day at the inn of the elder Lawrence, they were introduced by Boniface to his son, who, he said, "although then only in his fifth year, could recite them poetry or speeches, or take their likenesses." The visitors agreed that the boy's skill with the pencil should be put to the test; and the future president having been lifted on the table, and seated in an arm-chair, took their likenesses, with a rapidity, a spirit, and a correctness, which astonished them. With the exception of a few lessons in Latin and French, obtained through a private channel, all the education which young Lawrence received, he acquired between his sixth and eighth year; but his was a mind capable of educating itself, and long ere the young artist attracted public attention, he had treasured up a more than ordinary stock of knowledge. But drawing, particularly taking likenesses, chiefly occupied his attention until he was ten years of age, when he began of his own accord to attempt original compositions of the highest class. The subjects which he chose were of the most ambitious description, such as Peter denying Christ, Haman and Mordecai, and the like. His fame as an artist now spread amongst the families of distinction in the surrounding counties; and not long afterwards, the Honourable Daines Barrington noticed him in his *Miscellanies*, as a striking instance "of early genius in children." The elder Lawrence having failed in business, removed to Bath, where he placed his son for some time with a celebrated crayon painter, under whom he made surprising progress. At this time he executed, at half a guinea each, likenesses of the fashionables of Bath; and this initiatory exercise in drawing individuals in high life, arrayed in their gay and elegant costume, had, doubtless, considerable influence in forming the style of the artist, and preparing him to become the painter of patricians. He now numbered amongst his warm admirers and patrons persons of rank and fortune; but the most remarkable incident in his early career, was his receiving the great silver pallet from the Society of Arts, with a present of five guineas. These marks of distinction were conferred upon him for executing in crayons the Transfiguration of Raphael, when he was only thirteen years of age. His large crayon drawings became in great request; and in Oxford, Salisbury, and other places which he visited, he obtained considerable employment for his pencil. When in his sixteenth year, he conceived a strong desire to appear upon the stage; but the remonstrances of his friends induced him to abandon this project; and about a year afterwards, he made his first attempt in oil painting. In 1787 he removed to London, where he availed himself of the public institutions for instruction in his art, and commenced that career which terminated so triumphantly. He was received at the house of Sir Joshua Reynolds, and encouraged by the great head of the English school of art. His admission as a student at the Royal Academy, and his first appearance in the exhibition at Somerset House, soon followed his arrival in the metropolis. Each succeeding year he increased the number of the performances which he sent in; and his reputation growing apace, he was elected an associate of the Royal Academy on the 10th of November 1791.

The death of Sir Joshua Reynolds in 1792 opened up a fair field of competition for aspiring genius; and although Mr Lawrence was then only in his twenty-third year, it soon became apparent that he was destined to bear away the palm from the most gifted artists with whom he had to contend. The Dilettanti Society unanimously chose him as their painter in the room of Sir Joshua; and his majesty George III. also appointed him to succeed the deceased president, as his principal painter in ordinary. On the 10th of February 1794, Mr Lawrence was elected a royal academician; and employment now flowed upon him from all quarters. He made the most rapid progress in his profession, and his reputation grew steadily until he came to be generally considered as the first portrait painter of the age. An enumeration of the works of this description which he executed would comprehend all the rank, fashion, and intelligence which distinguished the times in which he lived, including those of most of the crowned heads of Europe. The royal family, the nobility and gentry, distinguished men of letters and statesmen, actors and actresses, all sat for their portraits to Lawrence. It may be justly said of him as it was said of Sir Joshua Reynolds, that "he painted three generations of beauties." In 1815 the Prince Regent conferred on him the honour of knighthood; and in 1818, at the request of the same illustrious individual, he was induced to proceed to Aix-la-Chapelle, to take likenesses of the most distinguished statesmen who had there assembled for diplomatic purposes. Having executed his mission at Aix-la-Chapelle, Sir Thomas proceeded to Vienna, and thence to Rome, where he had an opportunity of contemplating for the first time the great masterpieces of ancient art. During the whole of his residence on the Continent, he was received by the sovereigns of the different countries he visited, and entertained with marked distinction; and the propriety and elegance of his deportment made an impression highly favourable to his character as an English artist and gentleman. After an

Lawrence, St.

absence of eighteen months, he returned to England; but, before reaching his native country, he had been unanimously elected to succeed Mr West as president of the Royal Academy; and this office he continued to hold till his death, which took place on the 7th of January 1830.

In portrait-painting, the branch of art which he made his profession, Sir Thomas Lawrence was the most distinguished artist of the day. He was one of the few English painters who attained a proficiency in their art before visiting Italy, or without studying the old masters; a circumstance which must be attributed to his strong native genius and exquisite taste. The distinguishing characteristic of his style was the power of conveying a faithful resemblance, with, at the same time, a singularly delicate sense of beauty, grace, elegance, and dignity. An able writer thus speaks of him: "No painter who ever lived seemed to have dived more deeply into individual character, as conveyed by the conformation of the visage, and the expression of the features; and none knew more skilfully how to avail himself of the changeful appearances which they betrayed in those conversations which were dexterously introduced during the sitting, and which destroyed or relaxed a rigidity of muscle assumed on such occasions, and which frequently baffles the utmost ingenuity of the artist. In his female portraits (the great test of talent) he had more grace and a greater variety of attitude than Vandyke, although he certainly did not equal him in colouring. It is a general opinion also, among painters, that he had less nature and less breadth than Sir Joshua Reynolds; and that opinion is probably well founded. Sir Thomas, especially in the latter periods of his practice, exhibited more detail in his portraits, and appeared to paint with a smaller pencil, than his illustrious predecessor, who in his effects of light and shade seemed to take Correggio as his model. The hair in Sir Thomas's pictures was painted in fine masses, in a way peculiar to himself; and his eyes, to the splendour of which he sometimes made great sacrifices, were divine. The late Mr Fuseli, who was by no means a thorough-going admirer even of Sir Thomas, has been heard to say of him, 'But he paints eyes better than Titian.'"

His drawing was admirable, and some of his chalk sketches are considered by the best judges as fine as Michel Angelo or Raffaelle could have executed. Sir Thomas did not confine himself to portrait-painting alone, but executed paintings of a far higher order of art. Of these it has been observed by Mr Westmacott, "His illustrations of Cato, Coriolanus, and Hamlet, may be considered historical works, and examples of his creative genius, possessing a vigour of imagination, a propriety of sentiment, a breadth and chasteness of composition, worthy to be ranked with the classical and distinguished efforts of the sixteenth century; whilst his more comprehensive powers were displayed in the admirable picture of Satan: all eminent proofs that he possessed talents equal to the accomplishment of the highest designs in the art." In private life Sir Thomas Lawrence was most exemplary, being kind and liberal to artists, and ready to encourage rising merit. In discharge of his duties connected with the high station which he filled in relation to the academy, he displayed unremitting diligence and zeal; "and no man," says an academician, "died with better claims to the respect of his brother members." (R. R. R.)

LAWRENCE, *St*, a river of North America, and one of the largest in the world. It takes its origin in the magnificent basin of Lake Superior, in Upper Canada, and has a course to the sea of nearly 3000 miles. It is the grand outlet by which the immense Lakes Superior, Huron, Michigan, Erie, and Ontario, pour their surplus waters into the ocean through the Gulf of St Lawrence. The remotest spring of this great river is the stream called St Lewis, in lat. 48. 30. N. and long. about 93. W. From its source the general direction through Lakes Superior and Huron is south-east to Lake Erie, nearly due east from that lake, and then north-east to the sea. It receives in its vast course almost all the rivers that rise in the extensive range of mountains to the northward, called the Land's Height, which separate the waters falling into Hudson's Bay from those that descend into the Atlantic, together with all the rivers that have their sources in the ridge which commences on its southern bank, running nearly south-west to where the ridge falls on Lake Champlain. In different parts of its course this great river is known by different names. From the sea to Montreal it is called *St Lawrence;* from thence to Kingston in Upper Canada, the *Cataraqui* or *Iroquois;* between Lakes Ontario and Erie, the *Niagara;* between Lakes Erie and St Clair, the *Detroit;* between Lakes St Clair and Huron, the *St Clair;* and between Lakes Huron and Superior, the distance is called the *Narrows* or *Falls of St Mary.* There is thus formed an uninterrupted connection of upwards of 2000 miles. It is navigable for ships of the line to Quebec, about 400 miles; and to Montreal, a distance of 580 miles from the sea, for ships of 600 tons burden. The distance from Montreal to Lake Ontario is about 200 miles. The breadth of the river between Montreal and Quebec is from half a mile to four miles, the average breadth being about two miles. Below Quebec it gradually widens till it enters the gulf, where, from Cape Rosier to the Mingan settlement on the coast of Labrador, it is about 105 miles in breadth. The St Lawrence discharges annually into the ocean about 4,277,880 millions of tons of fresh water, of which 2,112,120 millions of tons may be reckoned melted snow; the quantity discharged before the thaw comes on being 4512 millions of tons per day for 240 days, and the quantity after the thaw begins being 25,560 millions per day for 125 days, the depth and velocity when in and out of flood being duly considered. Hence, a ton of water being nearly equal to fifty-five cubic yards of pure snow, the St Lawrence frees a country of more than 2000 miles square covered with it to the depth of three feet. The embouchure of this mighty stream is that part of the Gulf of St Lawrence where the island of Anticosti divides the mouth of the river into two branches. The solid contents of the St Lawrence, embracing Lakes Superior, Huron, Michigan, Eric, and Ontario, have been estimated at 1,547,792,360,000 cubic feet, and the superficial area being 72,930 square miles, the water therein would form a cube of nearly twenty-two miles on each side. The river, and the whole country, from the lowest parishes to Quebec, unfold scenery, the magnificence of which, in combination with the most delightful physical beauty, is certainly unequalled in America, and probably in the world. As the eminence is ascended, over which the post-road passes, or in sailing up or down the St Lawrence, there are frequently prospects which open a view of from fifty to one hundred miles of a river from ten to twenty miles in breadth. The imposing features of these vast landscapes exhibit lofty mountains, wide valleys, bold headlands, luxuriant forests, cultivated fields, pretty villages, and settlements (some of them stretching up along the mountains); fertile islands overspread with cottages, pastures, and flocks; rocky islets, and tributary rivers, some of them rolling over precipices, and one of them, Saguenay, like an inland mountain lake, bursting through a perpendicular chasm in the granitic chain; whilst, on the surface of the St Lawrence, majestic ships, large brigs, and vessels and boats of every description, present a spectacle at once sublime and beautiful, and calculated to charm the mind of the beholder. Of course the trade carried on by means of this river is very great. An account of it will be found in the article CANADA. (R. R. R.)

LAWRENCE, *Gulf of St*, the gulf which receives the waters of the numerous lakes and rivers of the Canadian portion of the American continent, and is formed by the western coast of Newfoundland, the eastern shores of Labrador, the eastern extremity of the province of New Brunswick, and by part of Nova Scotia and the island of Cape Breton. It communicates with the Atlantic by three different channels, namely, by the Gut of Canso, which divides Cape Breton from Nova Scotia, by a wider and main channel between Cape North in Cape Breton Isle and Cape Ray in Newfoundland, and by the narrow straits of Belleisle, which separate the coast of Labrador from Newfoundland. The distance from Cape Rosier, Gaspé Bay, to Cape Ray in Newfoundland, is seventy-nine leagues; and from Nova Scotia to Labrador, the distance is one hundred and six leagues. Several islands are situated in the gulf, of which the one most dangerous to navigators is St Paul's, a small barren isle lying between Newfoundland and Cape Breton. On the south side of the bay is St John's or Prince Edward's Island; to the northward are the small Magdalen Islands, eleven in number; north of the Magdalens is Brion's Island; and beyond this are the Bird Isles or Rocks, the most northerly of which is in lat. 47. 50. 28. north, and long. 61. 12. 53. west. On this island it is proposed to erect a light-house.

LAY, a kind of ancient poem amongst the French, consisting of very short verses.

There were two sorts of lays, the *great* and the *little*. The first was a poem consisting of twelve couplets of verses, of different measures. The second was a poem consisting of sixteen or twenty verses, divided into four couplets. These lays were the lyric poetry of the old French poets, and were imitated by some of the English. They were principally used on melancholy subjects, and are said to have been formed on the model of the trochaic verses of the Greek and Latin tragedies.

Lay-Brothers, amongst the Catholics, those pious but illiterate persons who at some convent devote themselves to the service of the religious. They wear a different habit from that of the religious, but never enter into the choir, nor are present at the chapters; nor do they make any vow except those of constancy and obedience. In the nunneries there are also lay-sisters.

Lay-Man, one who follows a secular employment, and has not entered into holy orders.

LAYERS, in *Gardening*, are tender shoots or twigs of trees, laid or buried in the ground, till, having struck root, they are separated from the parent tree, and become distinct plants. The propagating of trees by *layers* is done in the following manner: The branches of the trees are slit a little way, and laid under the mould for about half a foot; the ground should first be made very light, and after they are laid they should be gently watered. If they do not remain easily in the position they are put in, they should be pegged down with wooden hooks. The best season for doing this is, for evergreens, towards the end of August, and, for other trees, in the beginning of February. If they be found to have taken root, they are then cut off from the main plant the succeeding winter, and planted out. If the branch be too high from the ground, a tub of earth is raised to a proper height for it. Some pare off the rind, and others twist the branch, before they lay it; but this is not necessary. The end of the layer should be about a foot out of the ground; and the branch may either be tied tightly round with a wire, or cut upwards from a joint, or cut round for an inch or two at the place; and it is a good method to pierce several holes through it with an awl above the part tied with the wire.

LAZAR-HOUSE, or LAZARETTO, a public building, of the nature of an hospital, to receive the poor, and those afflicted with contagious distempers. In some places, lazarettos are appointed for the performance of quarantine; in which case those only are confined in them who have come from places suspected of being infected with the plague.

LEAD, a metal of a white colour, inclining to blue, and the least ductile, the least elastic, and the least sonorous of all the metals, but possessing a considerable degree of specific gravity.

The lead mines of Great Britain have been wrought from a very remote era. Previously to 1289, however, it would seem that those of Derbyshire only had been explored. But in the year now mentioned lead mines were discovered in Wales; and traces of silver having also been found in them, they were wrought with increased assiduity and attention. The present produce of the lead mines of Great Britain cannot be ascertained with any degree of accuracy. The lead mines of Derbyshire have been supposed to yield 5000 or 6000 tons annually; but they are said to be on the decline. Those upon the borders of Cumberland and Northumberland are supposed to yield, at an average, from 11,000 to 12,000 tons. The total produce of the Scotch mines is estimated at above 4000 tons. Subjoined is a table showing the past and present state of the trade in this article.

More than a third part of the whole lead sent out of the country in 1833 went to the United States, about 3000 tons to the East Indies and China, 1483 tons to Russia, and the remainder, in comparatively insignificant quantities, to various other countries. The decline of trade which has taken place since 1821 has been attributed to the opening of very rich mines in Spain; whilst the cheapness and facility with which they can be wrought enables the Spaniards to undersell every other country. The price of lead has fluctuated very much. The average price from 1800 to 1810 was L.27. 14s. 6d. per ton; from 1811 to 1821, L.23. 6s. 6d. per ton; and from 1822 to 1832, L.20. 7s. per ton. In 1832 the price had sunk as low as L.13. 10s. per ton, but it has since risen; indeed there is scarcely any article the price of which is subject to such variations. In France the consumption is rapidly increasing, and it is nearly all imported from Spain. The importations have increased from 6,211,500 kilogrammes, at an average of the four years ending 1822, to 15,742,192 kilogrammes, at an average of the two years ending with 1830. The lead-mines of the United States are as productive as any in the world, and have recently become of considerable importance. Those on Fever River produced in 1832 about 1412 tons. American manufactures of white and red lead, as well as shot, now nearly supply the domestic market.

LEAF, a part of a plant extended into length and breadth in such a manner as to have one side distinguishable from the other. This is Miller's definition. Linnæus denominates leaves the organs of motion, or muscles of the plant. See Physiology, Vegetable.

Leaf-*Skeletons.* One help for acquiring a knowledge of the anatomy of plants, is the art of reducing leaves to skeletons, which may be done by exposing the leaves to decay for some time soaked in water, by which means the softer parts will be separated from the internal and harder. By carefully wiping, pressing, and rinsing them, the harder parts may be obtained from the rest quite entire. Some have been able to separate the outer covering on both sides from the woody net, and even to split the latter into two. A naturalist in the year 1645 first conceived the idea of making leaf-skeletons by employing decomposition for that purpose, assisting it by several ingenious operations of art. When the method of producing these skeletons was publicly known, numberless preparations of them were everywhere attempted. So much did leaf-skeletons afterwards engage the attention of philosophers, that one Seligmann wrote a treatise on the various methods which might be employed in their preparation.

Leaf, in clocks and watches, is an appellation given to the notches of their pinions.

LEAGUE, a measure of length, containing more or fewer geometrical paces, according to the different usages and customs of countries. A league at sea contains 3000 geometrical paces, or three English miles. The French league sometimes contains the same measure, and sometimes consists of 3500 paces; the mean or common league consists of 2400 paces, and the little league of 2000. The Spanish leagues are larger than the French; seventeen Spanish leagues making a degree, or twenty French leagues, or sixty-nine and a half English statute miles. The Dutch and German leagues contain each four geographical miles. The Persian leagues are pretty nearly of the same extent with the Spanish; that is, they are equal to four Italian miles, which is pretty near what Herodotus calls the length of the Persian parasang, which contained thirty stadia, eight of which, according to Strabo, were equal to a mile. The word comes from *leuca* or *leuga*, an ancient Gaulish word for an itinerary measure, and retained in that sense by the Romans. Some derive the word *leuca* from λευκος, *white*, as the Gauls, in imitation of the Romans, marked the spaces and distances of their roads with white stones.

League also denotes an alliance or confederacy between princes and states for their mutual aid, either in attacking some common enemy, or in defending themselves against one. The word comes from *liga*, which, in the corrupt Latin, was used for a confederacy: *Qua quis cum alio ligatur.*

Leagues, amongst the Greeks, were of three sorts: 1. Σπονδη, Συνθηκη, or Ειρηνη, by which both parties were obliged to cease from hostilities, without molesting the allies of each other; 2. Επιμαχια, by which they engaged to lend assistance to each other in case of invasion; and, 3. Συμμαχια, by which they engaged to have the same friends and enemies, and to assist each other upon all occasions. All these leagues were confirmed with oaths, and imprecations, and sacrifices. The victims most generally sacrificed were a boar, ram, or goat, sometimes all the three; and sometimes bulls and lambs. They cut out the testicles of the animal, and stood upon them whilst they swore; then some of the hair of the victim was distributed to all present; and, lastly, they cut the animal's throat, which was called ὁρκια τεμνειν, in Latin, *ferire fædus.* This being done, they repeated their oaths and imprecations, calling the gods to witness the honesty of their intentions. A libation was then made of wine, which was mixed, to imply their conjunction and union; and whilst this was pouring out, they prayed that the blood of him who should break the treaty might be poured out in like manner. Upon these occasions no part of the victim was eaten. Still further to increase the solemnity of this obligation, the league was engraved upon brass, fixed up in places of public resort, and sometimes read at the solemn games. Some exchanged certain συμβολα, or *tesseræ*, upon the occasion, and frequently sent ambassadors on an appointed day, to keep each other in mind of their engagements.

The League, by way of eminence, denotes that famous one which existed in France from the year 1576 to 1593. Its intention was to prevent the succession to the crown of Henry IV. who was of the reformed religion; and it ended with his abjuration of that faith.

The Leaguers, or confederates, were of three kinds. The *zealous leaguers* aimed at the utter destruction, not only of the Huguenots, but also of the ministry. The *Spanish leaguers* had principally in view the transferring of the crown of France to the king of Spain, or the infanta his daughter. The *moderate leaguers* aimed only at the extirpation of Calvinism, without any alteration of the government.

LEAK, at sea, is a hole in the ship, through which the water comes in. A ship is said to *spring a leak* when she begins to leak, or to let in the water. The manner of stopping a leak is to put into it a plug wrapped in oakum and well tarred, or to insert a tarpawling clout, which keeps out the water, or to nail a piece of sheet-lead on the place. Seamen sometimes stop a leak by thrusting a piece of salt beef into it. The sea-water, says Mr Boyle, being fresher than the brine imbibed by the beef, penetrates into its body, and causes it to swell so as to bear strongly against the edges of the broken plank, and thereby stops the influx of the water. A ready way to find a leak in a ship is to apply the narrower end of a speaking trumpet to the ear, and the other to the side of the ship where the leak is supposed to be; then the noise of the water rushing in at the leak will be distinctly heard, and thereby discovered.

LEAKAGE, the state of a vessel that leaks, or lets in or out water or other liquid.

LEAKE, Richard, was born at Harwich in 1629, and was bred to the sea. At the Restoration, he was made master gunner of the *Princess*, a frigate of fifty guns, and in the first Dutch war distinguished himself by his skill and bravery in two extraordinary actions; one against fifteen sail of Dutch men of war; and another in 1667 against two Danes in the Baltic, in which, the commanding officers of the *Princess* being killed or desperately wounded, the command, according to the rules of war at that time, fell to the gunner. In 1669 he was promoted to be gunner of the *Royal Prince*, a first-rate man of war. He was engaged, with his two sons, Henry and John, in the battle against Van Tromp, in 1673, when the *Royal Prince* had all her masts shot away, nearly 400 of her men killed and disabled, and most of her upper tier of guns dismounted. As she lay thus like a wreck upon the water, a great Dutch man of war came down upon her with two fire-ships, either to burn or carry her off; and Captain, afterwards Sir George Rooke, thinking it impossible to defend her, ordered the men to save their lives, and the colours to be struck. Mr Leake hearing this, ordered the lieutenant off the quarter-deck, and took the command himself, saying, " the *Royal Prince* shall never be given up to the enemy while I am alive to defend her." The undaunted spirit of the brave gunner inspired with resolution the small residue of the ship's company; they returned with alacrity to the fight, and, under the direction of this valiant gunner and his two sons, sunk both the fire-ships, and having obliged the man of war to sheer off, saved the *Royal Prince*, and brought her into Chatham. But Mr Leake's joy in obtaining this victory was damped by the loss of Henry, his eldest son, who was killed near him. Soon afterwards Mr Leake was preferred to the command of a yacht, and also made gunner of Whitehall. In 1677 he obtained a grant for life of the office of master gunner of England, and storekeeper of the ordnance at Woolwich. In this situation he had full scope for his genius. He accordingly, amongst other things, invented the cushee piece; and contrived to fire a mortar by the blast of a piece, which has been used ever since. He was also the principal contriver of what the French call *infernals*, used at the bombardment of St Malo in 1693. Mr Leake had a surprising genius for all inventions of this kind; and had frequent trials of skill with French and Dutch gunners and engineers in Woolwich Warren, at which Charles II. and the Duke of York were often present, and in which he never failed to excel all his competitors. Nor was he less skilled in the art of contriving compositions for fireworks, of which he likewise made frequent trials with equal success.

Leake, *Sir John*, an English admiral, distinguished by his bravery and success, was born in 1656, and taught mathematics and gunnery by Mr Richard Leake, his father, master gunner of England. Having early entered into the navy, he distinguished himself under his father in 1673, in the memorable engagement between Sir Edward Spragg and Van Tromp, when only sixteen years of age; and being afterwards appointed captain, he signalized himself on various occasions, particularly by executing the desperate attempt of convoying some victuallers into Londonderry, which obliged the enemy to raise the siege, and also at the famous battle of La Hogue. In 1702, being made commodore of a squadron, he destroyed the French trade and settlements at Newfoundland, and restored to the English the possession of the whole island. On his return he was created rear-admiral; and soon afterwards he was made vice-admiral of the blue, and knighted. He was engaged with Admiral Rooke in taking Gibraltar; after which he particularly distinguished himself in the general engagement off Malaga, when, commanding the leading squadron of the van, consisting only of six ships, he drove that of the enemy, consisting of thirteen, out of the line of battle, so disabled that they never returned to the fight. In 1705, he relieved Gibraltar, which the French had besieged by sea, and the Spaniards by land, so seasonably, that the enemy was to have attacked the town that very night in several places, and would undoubtedly have made themselves masters of it. Five hundred Spaniards had, by the help of rope-ladders, climbed up the rocks by a way which was thought inaccessible; and at the same time they had got a great number of boats, to land, at the New Mole, three thousand men, who, by making a vigorous assault on the side next the sea, were to draw the garrison to oppose the attack, whilst the five hundred men concealed rushed into the town. The latter being the next day forced by hunger to quit their ambuscade, were discovered; upon which, Sir John assisting the garrison with sailors and marines, they were attacked with such vigour, that, though they had taken an oath not to surrender to the English, a hundred and ninety common soldiers and thirty-five officers accepted quarter, two hundred were killed on the spot, and the rest who endeavoured to make their escape fell headlong down the rock. He was soon afterwards made vice-admiral of the white, and then twice relieved the same fortress. The last time, he attacked five ships of the French fleet coming out of the bay, of which two were taken, and two driven ashore and destroyed. Baron Pointi died soon afterwards of the wounds he received in the battle; and in a few days the enemy raised the siege. In the year 1706, Sir John engaged in the reduction of Barcelona, and next year relieved that city when it was reduced to the last extremity, obliging King Philip to raise the siege. Soon afterwards he took the city of Carthagena, whence he proceeded to Alicant and Joyce, which both submitted to him; and he concluded the exploits of that year with the reduction of the city and island of Majorca. Upon his return home, Prince George of Denmark made him a present of a ring valued at L.400, and he had the honour of receiving L.1000 from the queen as a reward for his services. Upon the unhappy death of Sir Cloudesly Shovel, in 1707, he was made admiral of the white, and commander-in-chief of her majesty's fleet; and the next year, having surprised a convoy of the enemy's corn, he sent it to Barcelona, and thus saved both that city and the confederate army from the danger of famine. He then proceeded to the island of Sardinia, which he reduced to the obedience of King Charles; and soon afterwards assisted Lord Stanhope in the conquest of Minorca. On his return home, he was appointed one of the council to the lord high admiral; and in 1709 he was made rear-admiral of Great Britain. He was several times chosen member of parliament for Rochester; and in 1712 conducted the English forces to take possession of Dunkirk. But upon the accession of King George I. he was superseded, and allowed a pension of L.600 a year. After this he lived privately till his death, which happened at his house in Greenwich in 1720.

Leake, *Stephen Martin*, son of Captain Martin, went through different ranks in the herald's office till he came to be garter king at arms. He was the first person who wrote professedly on our English coins, two editions of his Historical Account of which were published with plates, under the title of *Nummi Britannici Historia*, the first, London, 1726, 8vo; the second, much improved, London, 1745, 8vo. He printed, in 1750, a Life of Sir John Leake, admiral of the fleet, to whom he was indebted for a considerable estate, which the admiral devised to trustees for the use of his son for life, and upon his death to Captain Martin, who had married Lady Leake's sister, and his heirs, by which means it came to the captain's son, who, in gratitude to the memory of Sir John Leake, wrote an account of his life, of which only fifty copies were printed. In 1766, he printed also fifty copies of the statutes of the order of the garter, 4to. He died in 1773, and was buried in the chancel of the parish church of Thorp in Essex.

Leander
‖
Lease.

LEANDER, in poetical history, a young man of Abydos, in Asia. He used to swim across the Hellespont by night to visit Hero, his mistress, who set forth a light to guide him; but in a tempestuous winter night he was drowned; upon which Hero seeing him dead on the shore, cast herself headlong from the tower, and perished.

LEAO, a mineral substance approaching to the nature of lapis lazuli, found in the East Indies, and of great use in the Chinese porcelain manufactures, as it affords the finest blue they are possessed of.

LEAO, a river of Chinese Tartary, which traverses the greater part of the province of Cheng-yang or Leao-tong, and falls into the head of the Gulf of Leao-tong.

LEAO-TONG, GULF OF, a considerable gulf, connected with that of Pe-tche-lee, and extending along the coast of the province of the same name in Chinese Tartary. It is 120 miles in length by eighty in breadth.

LEAP, in *Music*, is when the song does not proceed by conjoint degrees, as in the case where between each note there is an interval of a third, a fourth, a fifth, and the like.

LEAPING, or VAULTING, was an exercise much used both amongst the Greeks and Romans. The former called it ἁλμα, and performed it with weights upon their heads and shoulders. Sometimes they carried the weights in their hands, which were of different figures, but generally oval, and made with holes or covered with thongs, through which the leapers put their fingers. These weights were called ἁλτηρες. The contest was who could leap the highest and farthest. The place whence they jumped was called βατης, and that to which they leaped ἐσκαμμενα, because the ground was there dug up. This exercise was performed in the same manner by the Romans.

LEAR, the name of a British king, said in old chronicles to have succeeded his father Bladud, about the year of the world 3160. The story of this king and his three daughters is well known, from Shakspeare's tragedy founded upon it.

LEARCHUS, a celebrated Greek sculptor of Rhegium, in the south of Italy, who seems to have flourished at a very early period, before 620 B. C. He made a statue of Jupiter in bronze, which was seen at Sparta, and which was regarded as the most ancient work of its kind. It was not of one piece, but was made of pieces worked separately, and fixed to one another by means of nails and large hooks, so that the parts could not be separated. It is this species of work which Quatremère de Quincy has perfectly explained under the name of Sphurelaton in his *Jupiter Olympien.* (Pausanias, iii. 17. See Winckelmann, *Op.* vi. 1, 7.)

LEASE, from the French *leiser, demittere*, to let, in law, a demise, or letting of lands, tenements, or hereditaments, unto another for life, a term of years, or at will, for a rent reserved. A lease is either written, called an *indenture, deed-roll*, or *lease* in writing; or by word of mouth, called *lease parole.*

LEASE and *Release*, a species of conveyance used in the English law, first invented by Serjeant Moore, soon after the statute of uses, and now the most common of any, and therefore not to be shaken; though very great lawyers formerly doubted its validity. A lease, or rather bargain and sale, upon some pecuniary consideration, for one year, is made by the tenant of the freehold to the lessee or bargainee. Now this, without any enrolment, makes the bargainer stand seised to the use of the bargainee, and vests in the bargainee the *use* of the term for a year; and then the statute immediately annexes the *possession*. He therefore, being thus in possession, is capable of receiving a release of the freehold and reversion, which must be made to a tenant in possession; and accordingly, the next day, a release is granted to him. This is held to supply the place of livery of seisin; and so a conveyance by lease and release is said to amount to a feoffment.

LEASH, amongst sportsmen, denotes three creatures of any kind, but chiefly greyhounds, foxes, bucks, and hares. The term *leash* also signifies a line to hold in a hunting dog; and a small long thong of leather, by which a falconer holds his hawk.

LEATHER, the skins of several sorts of beasts dressed and prepared for the use of various manufacturers, whose business it is to apply them to useful purposes.

The manufacture of leather is of great importance in every country; and in Great Britain it ranks third or fourth on the list, being inferior only to those of cotton, wool, and iron, if it be not superior to the latter. Mr M'Culloch estimates the total quantity of all sorts of leather, tanned, tawed, dressed, and curried in this country at about 50,000,000 lbs. which, at one shilling and eight pence per pound, gives L.4,166,000 as the value of the leather only. By the same authority, the value of the finished articles of leather manufacture is estimated at L.12,500,000, the value of the leather being taken at one third that of the goods produced from it; and four millions being deducted for the material, there remain L.8,500,000 as the aggregate amount of profits, wages, and the like. Twenty per cent. being set aside as profit, rent of workshops, and the like, there remains as wages, the sum of L.6,800,000; and supposing those employed as shoemakers, saddlers, glovers, and others, to make at an average L.30 a year each, the entire number of such persons will amount to 226,000. This, however, does not include the tanners, curriers, and other persons employed in dressing the leather; and these being estimated at 28,300, we have a grand total of 254,300 individuals employed in the various departments of the business. "Those who may be inclined to suspect these estimates of exaggeration," says Mr M'Culloch, "would do well to reflect on the value of the shoes annually manufactured. It is generally supposed, that the expenditure upon shoes may be taken, at an average of the whole population, at ten shillings each individual, young and old; which, supposing the population to amount to 16,000,000, would give eight millions for the value of shoes only; but taking the value of the shoes at only 8s. 6d. each individual, it gives L.6,800,000 for the amount. Mr Stevenson supposed that the value of the saddlery, harness, gloves, &c. may be assumed to be at least equal to that of the shoes; but we believe this is too high, and have taken it at L.1,100,000 below the value of the shoes. In estimating the value of the entire manufacture at L.12,500,000, we incline to think that we are as near the mark as it is easy to come in such investigations."

Leather was long subject to a duty of $1\frac{1}{2}$d. per pound, and in 1812 this was doubled. In 1822, however, it was reduced to the former amount, and in 1830 the duties on leather were totally abolished.

Number of Pounds Weight of Leather charged with Duties of Excise in England in 1824–1829.

1824	53,429,539	1827	47,616,316
1825	52,274,957	1828	50,233,689
1826	44,927,216	1829	46,200,843

The quantity annually charged with duty in Scotland during the same period was at an average about 6,000,000 lbs. The quantity of wrought and unwrought leather exported in 1829 amounted to 1,338,937 lbs. of the declared value of L.268,380. The value of the saddlery and harness exported during the same year was L.83,303. Nearly two thirds of the leather exported is sent, principally in the shape of shoes, to the British West-Indian and North-American colonies.

Dyeing of LEATHER, *Skins, &c. Blue* is given by steeping the subject a day in urine and indigo, then boiling it with alum; or it may be given by tempering the indigo with red wine, and washing the skins therewith. *Red* is given by washing the skins, and laying them two hours in galls, then wringing them out, dipping them in a liquor made with ligustrum, alum, and verdigris in water; and, lastly, in a dye made of Brazil wood, boiled with ley. *Purple* is given by wetting the skins with a solution of roche alum in warm water; and, when dry again, rubbing them with the hand with a decoction of logwood in colder water. *Green* is given by smearing the skin with sap-green and alum-water boiled. *Dark green* is also given with steel filings and salammoniac steeped in urine till soft, then smeared over the skin, which is to be dried in the shade. *Sky colour* is given with indigo steeped in boiling water, and the next morning warmed and smeared over the skin. *Yellow*, by smearing the skin over with aloes and linseed oil dissolved and strained, or by infusing it in weld. *Orange colour* is given by smearing with fustic berries boiled in alum-water; or, for a deep orange, with turmeric.

LEAVEN, a piece of sour dough, used to ferment and render light a much larger quantity of dough or paste.

Leaven was strictly forbidden by the law of Moses during the seven days of the passover; and the Jews, in obedience to this law, carefully purified their houses from all leaven, as soon as the vigil of the feast began. Nothing of honey or leaven was to have place in any thing presented to the Lord, upon his altar, during this solemnity. If, during the feast, the least particle of leaven was found in their houses, they imagined that the whole was polluted, for a little leaven leaveneth the whole lump. Leaven, in its figurative sense, signifies the bad passions of envy, and malice, and rancour, which sour the temper, and extend their fermenting influence over the social affections; whereas unleavened bread implies sincerity and truth. It is frequently used for any kind of moral contagion.

LEAVES of Plants. See Leaf.

LEBADEA, or Lebadia, an ancient town of Bœotia, on the borders of Phocis, situated between Helicon and Chæronea, near Coronæa. In it stood the oracle of Jupiter Trophonius, which whoever went to consult descended into a subterraneous gulf.

LEBEDAN, a circle in the Russian province of Tambow, extending from north latitude 52. 37. to 53. 9. and in east longitude from 38. 33. to 40. 13. It contains 1210 square miles, and a population of 67,260 persons. It is chiefly watered by the Don, and is of somewhat more than moderate fertility. The capital is the city of the same name, 680 miles from Petersburg, situated on the river Don. It contains seven churches, 604 houses, and 3540 inhabitants. Long. 39. 3. E. Lat. 53. 5. N.

LEBEDJAN, a circle of the Russian province of Ukraine, extending in north latitude from 50. 20. to 50. 60. and in east longitude from 34. 13. to 34. 59. It contains 1366 square miles, with a population of 136,000 persons, inhabiting two cities, and 218 villages. The capital is a city situated on the river Atschonaja, 945 miles from Petersburg. It contains thirteen churches, all of wood, 1207 houses, and 8971 inhabitants. Long. 34. 35. E. Lat. 50. 30. N.

LEBRIJA, or Lebrixa, a town of Spain, in the province of Andalusia, about three leagues north of Xeres, and on the road by the plain from that city to Seville. It was a plain of great celebrity during the contests between Cæsar and Pompey. It was the head-quarters of the latter, and the place where three Roman knights had formed a conspiracy to desert, with all the cavalry, and join Cæsar, a few days before the decisive battle of Meenda. A Roman camp, near the town, with a magnificent castle in the centre, is still remaining. The lower part is Roman bricks, the upper part is of Moorish erection. It is partly in ruins, but a large portion is converted into a monastery, and the whole has a most imposing effect. The country around is very fertile, abounding in corn, wine, and oil, in the cultivation of which the inhabitants find employment. It contains 6000 inhabitants.

LECCE, a city of the kingdom of Naples, the capital of the province of Otranto. It stands on an extensive and fertile plain between Bari and Otranto, is surrounded with walls, and is the most regular and one of the most beautiful cities of the south of Italy. The great square contains some magnificent edifices, adorned with valuable statues. It is the seat of a bishop, and of the several provincial courts of law. It contains a cathedral and thirty-two churches, twenty-eight religious houses for both sexes, two Latin schools, and a college for nobles. It has a population of 14,100 persons, some of whom are engaged in cotton manufactures from cotton-wool grown in the vicinity, which is of an excellent quality. Good wine and tobacco are also raised around it. Long. 18. 30. E. Lat. 40. 38. N.

LE CROIFIC, a sea-port of France, in the department of the Lower Loire, and arrondissement of Savenay. It is situated on a tongue of land which forms the harbour, and has near it some extensive marshes, on which salt is made. It contains 320 houses, and 2450 inhabitants, who are chiefly employed in the herring and Sardinia fishery. Long. 2. 37. W. Lat. 47. 17. N.

LECTI, beds or couches, were of two kinds amongst the Romans, as being destined to two different uses, viz. to lie upon at entertainments, and to repose upon for nightly rest. The first was called *lecti tricliniares*, the other *lecti cubicularii*.

LECTICA was a litter or vehicle in which the Romans were carried. It was of two kinds, covered and uncovered. The covered *lectica* is called by Pliny *cubiculum viatorum*, a traveller's bed-chamber. And indeed we are informed that Augustus frequently ordered his servants to stop his litter that he might sleep upon the road. This vehicle was carried by six or eight men called *lecticarii*. The *lectica* differed from the *sella* in this, that in the one the traveller could recline himself for sleep, whereas in the other he was obliged to sit. The *lectica* was invented in Bithynia; the *sella* was a Roman machine, and esteemed the more honourable of the two. *Lectica* was also the name of the funeral bed or bier for carrying out the dead.

LECTICARII, amongst the Romans, servants who carried the *lectica*.

LECTICARIUS was also an officer in the Greek church, whose business it was to bear off the bodies of those who had died, and to bury them. They were otherwise denominated *decani* and *copiatæ*.

LECTISTERNIUM, a solemn ceremony observed by the Romans in times of public danger, when an entertainment was prepared with great magnificence, and served up in the temples. The gods were invited to partake of the good cheer, and their statues were placed upon couches round the table, in the same manner as men used to sit at meat. The first *lectisternium* held at Rome was in honour of Apollo, Latona, Diana, Hercules, Mercury, and Neptune, to put a stop to a contagious distemper which raged amongst the cattle, in the year of Rome 354. At these feasts the Epulones presided, and the sacred banquet was called *epulum*. Something like the *lectisternium* was occasionally observed amongst the Greeks, according to Casaubon.

LECTORES, amongst the Romans, servants in great men's houses, who were employed in reading whilst their masters were at supper. They were called by the Greeks *Anagnostæ*.

LECTOURE, an arrondissement of the department of Gers, in France. It extends over 427 square miles, comprehends five cantons, divided into ninety-three communes, and contains 58,500 inhabitants. The capital, the city of the same name, is situated on a hill, at the foot of which the Gers flows. It contains 940 houses, and 6600 inhabitants, who tan leather, and carry on considerable traffic in wine and brandy. Long. 0. 31. 48. E. Lat. 43. 56. 2. N.

LECTURERS, in England, are an order of preachers in parish churches, distinct from the rector, vicar, and curate. They are chosen by the vestry, or chief inhabitants of the parish, supported by voluntary subscriptions and legacies, and are usually the afternoon preachers in the Sunday service.

LEDA, in fabulous history, a daughter of Thespius and Eurythemis, who married Tyndarus, king of Sparta. She was seen by Jupiter bathing in the river Eurotas when she was some few days advanced in her pregnancy, and the god, struck with her beauty, resolved to deceive her. He persuaded Venus to change herself into an eagle, whilst he assumed the form of a swan; and after this metamorphosis, Jupiter, as if fearful of the tyrannical cruelty of the bird of prey, fled through the air into the arms of Leda, who willingly sheltered the trembling swan from the assaults of his superior enemy. The caresses with which the naked Leda received the swan enabled Jupiter to avail himself of his situation, and nine months after this adventure the wife of Tyndarus brought forth two eggs, from one of which sprung Pollux and Helena, and from the other Castor and Clytemnestra. The two former were deemed the offspring of Jupiter, and the latter were claimed by Tyndarus. Some mythologists attribute this amour to Nemesis, and not to Leda; and they further mention, that Leda was intrusted with the education of the children which sprung from the eggs brought forth by Nemesis. To reconcile this diversity of opinions, others maintain that Leda received the name of Nemesis after her death. Homer and Hesiod make no mention of the metamorphosis of Jupiter into a swan, and hence some have imagined that the fable was unknown to these ancient poets, and probably invented since their age.

LEDBURY, a market-town of Herefordshire, in the hundred of Radlow, 121 miles from London, not far from the foot of the Malvern Hills. It is situated on the river Leden, and on the side of a canal from Gloucester to Hereford. There are some remains of a woollen manufacture, which was formerly considerable. The market is held on Tuesday. The population amounted in 1801 to 3058, in 1811 to 3136, in 1821 to 3421, and in 1831 to 3852.

LEDGER, the principal book in which merchants enter their accounts. See BOOK-KEEPING.

LEE, an epithet used by seamen to distinguish that part of the hemisphere to which the wind is directed, from the other part whence it blows, and which is accordingly called *to windward*. This expression is chiefly used when the wind crosses the line of a ship's course, so that all on one side of her is called *to windward*, and all on the other side *to leeward*. Hence,

Under the LEE, implies farther to the leeward, or farther from that part of the horizon whence the wind blows.

Under the LEE *of the shore*, means at a short distance from the shore which lies to windward. This phrase is commonly understood to express the situation of a vessel anchored, or sailing under the weather-shore, where there is always smoother water, and less danger of heavy seas, than at a great distance from it.

LEE *Lurches*, the sudden and violent rolls which a ship often takes to the leeward in a high sea, particularly when a large wave strikes her on the weather-side.

LEE-*Side*, all that part of a ship or boat which lies between the mast and the side farthest from the direction of the wind; or otherwise, that half of a ship which is pressed down towards the water by the effort of the sails, as separated from the other half by a line drawn through the middle of her length. That part of the ship which lies to windward of this line is accordingly called the *weather-side*. Thus, admit a ship to be sailing southward, with the wind at east, then is her starboard or right side the *lee-side*, and the larboard or left the *weather-side*.

LEE, NATHANIEL, a dramatic poet of the eighteenth century, was the son of a clergyman, who gave him a liberal education. He received the rudiments of learning at Westminster School, from which he went to Trinity College, Cambridge. Coming to London, however, his inclination prompted him to appear on the stage; but he was not more successful in representing the thoughts of other men than many a genius besides, who has been equally unfortunate in treading the stage, although he perhaps knew well enough how to write for it. He produced eleven tragedies, all of which contain a very great portion of true poetical enthusiasm. His Rival Queens, his Theodocius, and his Alexander the Great, are those which longest kept possession of the stage. None, perhaps, ever felt the passion of love more truly, nor could any one describe it with more tenderness. Addison commends his genius highly, observing, that none of our English poets had a happier turn for tragedy, although his natural fire and unbridled impetuosity hurried him beyond all bounds of probability, and sometimes were quite out of nature. The truth is, this poet's imagination ran away with his reason; so that he at length became quite crazy, and grew so mad that his friends were obliged to confine him in bedlam. Here he made the famous reply to a coxcomb scribbler, who had the cruelty to jeer him with his misfortune, by observing that it was an easy thing to write like a madman. "No," said Lee, "it is not an easy thing to write like a madman; but it is very easy to write like a fool." Lee had the good fortune to recover the use of his reason so far as to be discharged from his melancholy confinement; but he did not long survive his enlargement, and died at the early age of thirty-four. Cibber, in his Lives of the Poets, states that he perished unfortunately in a night ramble in London streets.

LEECHES, in a ship, the borders or edges of a sail, which are either sloping or perpendicular.

The leeches of all sails, the tops and bottoms of which are parallel to the deck, or at right angles to the mast, are denominated from the ship's side, and the sail to which they belong; as the starboard leech of the main-sail, the lee leech of the fore-top-sail, and so on. But the sails which are fixed obliquely on the masts have their leeches named from their situation with respect to the ship's length; as the fore-leech of the mizen, the after-leech of the jib or fore-stay sail, and the like.

Leech-Lines, certain ropes fastened to the middle of the leeches of the main-sail and fore-sail, and communicating with blocks under the opposite sides of the top, whence they pass downwards to the deck, and serve to truss up those sails to the yard as occasion requires.

Leech-Rope, a name given to that part of the bolt-rope to which the border or skirt of a sail is sewed. In all sails, the opposite leeches of which are of the same length, it is terminated above the earing, and below the clue.

LEEDS, in the west riding of Yorkshire, the metropolis of the woollen manufacture, is the fifth town in England in point of population and commercial activity, being only exceeded in these respects by London, Manchester, Liverpool, and Birmingham. The population of the parish and borough, which are co-extensive, amounted, by the census of 1831, to 123,393. The progressive rapidity with which this flourishing place has increased within the present century, is shewn by the decennial enumerations of the inhabitants, which are as follows:—In 1801, the population of the borough was 53,162; in 1811, it was 62,534; in 1821, it was 83,796; and in 1831, it was 123,393. The borough and parish of Leeds are, however, very extensive, measuring, in their longest diameter, not less than seven miles, and in circumference thirty; covering 21,450 acres; and comprising, besides the town and township, ten out-townships, several of which are populous villages, nearly all engaged in the manufacture of woollen cloth. The population of the township of Leeds, that is, of the town, in 1831, was 71,602; and of the out-townships as follows:—Hunslet, 12,074; Holbeck, 11,210; Bramley, 7039; Wortley, 5944; Armley, 5159; Headingley-with-Burley, 3849; Beeston, 2128; Chapel Allerton, 1934; Farnley, 1591; Potternewton, 863. The first two of these out-townships, Hunslet and Holbeck, may strictly be called suburbs of the town, and therefore the population of the town may be considered as 94,886.

Leeds is situated nearly in the centre of the West Riding, in the wapentake of Skyrack, and in the pleasant and well-cultivated valley of the Aire. The surrounding country possesses much cheerful beauty, of which one indication is furnished by the fact, that the Abbey of Kirkstall, one of the grandest monastic structures in the kingdom, and of which the remains are highly picturesque, was built in the same valley, within three miles of the town. The soil is moderately fertile, and the country is not deficient in wood. For manufacturing and commercial purposes, the situation of Leeds is highly advantageous. Placed within a short distance of the great line of road from the metropolis to Scotland, betwixt the two ports of Liverpool and Hull, both exceedingly favourable for foreign trade, and on a navigable river emptying itself into the Humber, its facilities for internal and foreign traffic can scarcely be surpassed. But in its vicinity to large and productive coal-fields and iron-mines, it possesses still higher requisites for manufacturing prosperity. Coal, water, and iron, are the three grand sources of success in manufactures, because they afford all that is needed for the making and working of machinery. This combination of advantages exists in an eminent degree in Leeds, and in the woollen district of Yorkshire. The productive coal-pits of Middleton are within three miles of the town, and the coals are brought to Leeds by a private railway belonging to the proprietor of the pits, Mr Brandling.

Though regarded as the capital town of this great manufacturing district, Leeds is not in its centre, but on its border. Eastward and northward of Leeds, the country is wholly agricultural; westward and to the south-west, in all the valleys and on all the hills betwixt that town and the long and high range that separates Yorkshire from Lancashire, the populous towns and villages resound with the steam-engine and the shuttle, and are daily, save on the Sabbath, canopied by their self-created clouds of smoke. In this district are carried on, a woollen manufacture of great extent and of some antiquity; a worsted stuff manufacture, a modern and vigorous graft on the former; fancy manufactures, of which the raw materials are wool, cotton, and silk; the spinning of flax; and the weaving of linen. The manufactures of Leeds itself are principally that of woollen cloth, the spinning of flax to a great extent, and of worsted to a smaller extent, and one branch of the worsted stuff manufacture; but its merchants also buy extensively the woollen and stuff goods made in the neighbouring towns and villages, and get them finished and dyed; so that Leeds is a general mart for all these fabrics. The operatives in all the branches of manufacture and trade, except the stuff weavers, earn good wages, and thus have the means of great comfort.

The cloth markets of Leeds, held every Tuesday and Saturday, are attended by several hundreds of clothiers from the surrounding villages to a distance of about ten miles. Most of these clothiers are small freeholders, possessing capital enough to keep a few looms at work in their own houses or an adjoining workshop, and often labouring themselves, and employing their families, in weaving. They purchase their own wool, get it dyed at Leeds or elsewhere, and scribbled and slubbed at the mills which perform those processes for hire; they then spin it by means of the jenny, and weave the cloth, which they bring in an undressed state to the Leeds cloth-halls, where it is bought by the merchants, and is afterwards dressed and finished in the mills of that town. From twelve to twenty years since, this system of domestic manufacture seemed in danger of extinction, from the successful rivalry of the factory system. The large manufacturers having, a few years before that time, succeeded, by gig-mills and dressing machinery, in taking the finishing department out of the hands of the croppers, thought they could, with equal advantage, carry on the spinning and weaving in their large establishments, and thus perform every part of the manufacture within the same building, from the sorting of the wool to the turning out of the superfine cloth ready for the draper or tailor. This change was not occasioned by the application of steam-power to the moving of the looms, for the power-loom was then only used in one or two woollen mills; but was recommended chiefly by the advantage of having the cloth made under the eye of the merchant-manufacturer, who expected thus to be able to adapt his fabrics more exactly to the wants of his customers, to command a better cloth, and to obtain for himself the profit of spinning the yarn and making the cloth, as well as of the early and the finishing processes. With this view, extensive weaving shops were attached to most of the mills; and mule-jennies driven by power were substituted for the jennies of the domestic manufacturers. The calculations of the mill-owners were, however, disappointed. The spinning department succeeded, but not so the weaving. They found it necessary, even in the ordinary state of things, to pay higher wages for weaving in the towns than were paid in the country; and the trades' unions formed amongst the weavers in these large establishments, forced up wages still higher, so as to make it more expensive to the great manufacturers to make the cloth than to buy it of the domestic clothier. In consequence of this, and of the extreme annoyance given by the trades' unions to the masters, many of the leading houses either wholly or partially abandoned the weaving; and the village clothiers, who had been threatened with ruin, regained their trade, and are now enjoying much prosperity. If, however, the power-loom should continue to gain ground as it has done within the last two or three years, and it should appear that woollen cloth can be manufactured better or cheaper by that machine than by the hand-loom, another change must take place, and the town of Leeds will then probably take away much of the weaving from the villages.

The Leeds cloth-halls, of which there are two, one for the sale of coloured cloths, and one for white cloths only, form an interesting spectacle on the market days. They are very large plain structures, not divided into rooms, but forming covered galleries or streets of great length, simply fitted up with low stands or benches along each side of the street, on which the clothiers place their cloth; and leaving an aisle of about two yards in width down the centre, along which the merchants walk, to examine the pieces exposed for sale, and make their bargains. The cloth-halls are under the management of trustees chosen by the clothiers, one or two from each considerable village, and each clothier purchases one or more stands. The market opens, at a certain fixed hour, on the mornings of Tuesday and Saturday, and is kept open only about an hour and a half, during which period all the business of buying and selling is transacted. Punctuality and despatch are of course requisite. At the appointed hour of commencement, the clothiers are ranged behind their stands, and the merchants enter the hall. When the latter find such pieces of cloth as they require, the price is inquired, and, if a bargain should be struck, a slight memorandum of price and quantity is made on the spot; the cloth is left, and the clothier afterwards takes it to the merchant's warehouse, to be measured and more carefully examined. In this way goods of the value of many thousand pounds are sold each market-day within a very short time. The hour of closing the market is rigidly enforced, by a fine of five shillings being levied on any merchant remaining in the hall five minutes after the ringing of a bell. The remainder of the day is generally spent by the clothier in delivering his goods, in attending their measurement and examination, in receiving payment, in buying of the woolstapler a fresh stock of the raw material, and in making his arrangements with the dyer and the mill-owner for dyeing and scribbling the wool. The coloured cloth-hall was built in the year 1758; it forms a great quadrangle, inclosing an area of the same shape. The longer sides of the quadrangle are 128 yards in length, and the shorter sixty-six yards, and it contains 1800 stands. The white cloth-hall was built in 1775; it is nearly of the same extent as the other hall, and contains 1210 stands. The market in the white cloth-hall commences after that in the coloured-cloth-hall is over, so as to allow the merchants an opportunity of attending both. Before the erection of these halls, the cloth-market was held in the long street called Briggate, and on the bridge.

The woollen-cloths of Leeds and Yorkshire are confessedly inferior to those of the West of England. About twenty years since, a great improvement in the manufacture and finishing of cloth was made by Mr William Hirst, of Leeds, whose manufacture was at least equal to that of the West of England; and he was able to command a high price for his goods. His success and that of others shew that as good cloth may be made in Yorkshire as in Gloucestershire and Wiltshire. But the Yorkshire manufacturers having been habituated to make an inferior article, and to sell it at a lower price, they do not readily abandon their old habits. In cloths of the lower qualities they are unrivalled, and these constitute the great bulk of their production. The example of a few manufacturers of capital, intelligence, and spirit, and adding to the qualities, which are already possessed by many of the Yorkshire manufacturers, a determination to use the best materials, and to turn out the best fabrics, would probably regain for that county a reputation for superfine cloths. The largest woollen mills in Leeds are those of the wealthy firm of Benjamin Gott and Sons.

The spinning of flax by machinery was commenced in Leeds, or the neighbourhood, nearly fifty years since, by Mr John Marshall, who, though not the first, was one of the first to apply the principle of Sir Richard Arkwright's water-frame, invented in the cotton-manufacture, to the spinning of linen yarn. After a doubtful struggle with the difficulties that presented themselves, Mr Marshall's talent, boldness, and perseverance at length triumphed, and he established a trade which has raised him from very moderate circumstances to the possession of immense wealth, and has made him a great benefactor to his native town. That gentleman represented the county of York in Parliament from 1826 to 1830, and his second son has represented the borough of Leeds in one Parliament. The flax-mills of Messrs Marshall and Sons, in the township of Holbeck, are very extensive, employing 1300 work-people. Several other flax-mills have also been established in Leeds, most of them by gentlemen who were originally in the employment of Messrs Marshall. The business has succeeded to a great extent, and now employs about six thousand hands, with excellent profit to the capitalists, and good wages to the workmen.

The spinning of worsted yarn, and the weaving of worsted stuffs by power-looms, are successfully carried on by a few houses in Leeds, and these branches seem likely to be extended, though they belong more peculiarly to Bradford. There is also in Leeds a branch of the worsted-stuff manufacture, consisting of the weaving of camlets and low stuffs, employing about a thousand looms, the weavers being for the most part Irish. The mercantile department of the stuff-trade is largely prosecuted; and the merchants buy their goods, in the grey or unfinished state, at the Bradford market, and have them dyed and finished at Leeds. There is an establishment in this town for the spinning of waste silk.

Where several manufactures are carried on to a great extent, there must of course be many machine-makers; and this, accordingly, is a flourishing business in Leeds. Steam-engines, of excellent quality, are made by the firm of Fenton, Murray, and Jackson. The woollen and stuff dyers also form a rather numerous class in this industrious community; and the trades of the wool-stapler, the drysalter, and the oil-merchant, employ considerable capitals.

The following statements are from the returns of Mr Baker, the superintendent of factories, at the close of the year 1835:—

Number of Persons employed in Mills in the Borough of Leeds.

Woollen.	Flax.	Worsted.	Silk.
9312	5926	1420	153

Number of Power-Looms in the Borough of Leeds.

Woollen.	Worsted.
213	818

It should be observed, that the above numbers by no means shew the proportional importance of the woollen and flax trades in Leeds. Flax being only spun, and no linens woven, in Leeds, all the processes are performed in the mills, and all the hands employed are shewn in the above returns. But not so in the woollen manufacture. Most of the weavers work in their own houses, or small work-shops; some branches of the finishing are not performed in the mills; and the establishments of the dyers, woolstaplers, &c. are also separate.

By the Leeds and Liverpool Canal, Leeds has a water communication with the Western Sea; and by the river Aire, and the canals formed in connection with it by the Aire and Calder Navigation Company, vessels of considerable burden come up from the Humber to Leeds. The water communication with the ports of Hull, Goole, and London, and with other parts of the United Kingdom and the north of Europe, is therefore good. Still further to facilitate the transport of goods and passengers, a railway of twenty-one miles in length has been formed from Leeds to Selby, a town on the river Ouse, to which steam-packets come daily from Hull. This railway was opened in September 1834; it is well constructed, and is paying a fair interest to the proprietors. It will, however, be more useful and prosperous when the projected railway from Hull to Selby shall be made. A bill for this undertaking is now (1836) before Parliament, and when the work shall be completed, the journey from Leeds to Hull will be performed in less than three hours, which will at once be advantageous to the commerce of Hull, and to the manufactures of Yorkshire and Lancashire. A railway is also projected between Manchester and Leeds; and when this shall be made, as well as that from Hull to Selby, a railway communication will be completed across the island, from Liverpool to Hull, through the heart of the greatest cotton and woollen manufactures in the world. The prosperity of those districts must necessarily be increased by the extraordinary facilities that will thus be given to foreign and inland traffic. The capitalists of Leeds being alive to the importance of this new mode of conveyance, a railway has been planned from Leeds to Derby, called the North Midland Railway, and the bill is now (1836) before Parliament. By this line, in connexion with the London and Birmingham Railway, now in course of formation, and either the Midland Counties or the Derby and Birmingham Railway, both projected, a direct communication will be opened from Leeds to the metropolis, and to the centre and west of England, as well as to Wakefield, Barnsley, Sheffield, Derby, Nottingham, and Leicester. It is also more than probable that a railway will shortly be constructed from Leeds northwards to Durham, Newcastle, Edinburgh, and Glasgow. This town will then enjoy every advantage that can be given by the most rapid communication with all parts of Great Britain.

Leeds is an ancient town, but has been the scene of no historical events. It was probably a Roman station. The ancient name, *Loidis*, is Saxon, being derived either from *Loid*, a people, or from the proper name of one of its Saxon possessors. In the time of William the Conqueror it appears to have had a very small population. The following is the record of Domesday Book: "In Ledes, ten carucates of land and six oxgangs to be taxed. Land to six ploughs. Seven thanes held it in the time of King Edward for seven manors. Twenty-seven villanes, and four sokemen, and four bordars, have now there fourteen ploughs. There is a priest and a church, and a mill of four shillings and ten acres of meadow. It has been valued at six pounds, now seven pounds." After the Conquest, Leeds belonged to Ilbert de Lacy, by whom it seems to have been granted to the Paganels; and in the reign of John, by which time the town had risen into some consequence, Maurice Paganel granted a charter to the burgesses. A castle of considerable strength, called "famous" by the historian Thoresby, existed here in the reign of Stephen, by whom it was besieged in 1139 on his march to Scotland; and Richard II. was confined in it in 1399, before being committed to Pontefract Castle, the scene of his murder. Every trace of the castle has long since disappeared, and the site of the park attached to it is only known from the names of the streets which have been built upon it. A survey taken in the reign of Edward III. shews that the woollen-trade already existed here, as "fulling-mills" are mentioned; so that Leeds must have been one of the oldest seats of the woollen manufacture in England. Its trade seems, however, to have languished, for Leland thus speaks of it in the reign of Henry VIII. "Ledes, two miles lower down than Christal Abbay, on Aire river, is a praty market toune, subsisting chiefly by clothing, having one paroche church, reasonably well builded, and as large as Bradeford, but not so quik as it." At that day, also, Wakefield was larger than Leeds; but the latter place subsequently increased far beyond all the neighbouring towns. Charles I. gave a charter to the borough, under which Sir John Savile, of Howley-hall, from whom several noble families are descended, was the first honorary alderman. The arms of the town bear testimony to this connexion with the Saviles, as two crowned owls, or *hullarts*, the arms of that family, were added to the golden fleece, the appropriate ensign of this seat of the woollen manufacture. Another charter was given to Leeds by Charles II. in 1661, under which a corporation was formed, consisting of a mayor, twelve aldermen, and twenty-four assistants. This charter, though taken away by James II., was restored by William and Mary, and continued in existence till the general reform of the municipal corporations of England by the act of 5th and 6th William IV, c. 76, which has given to Leeds, instead of a close and self-elected body for the government of the borough, a representative body consisting of sixteen aldermen and forty-eight councillors. The charter of Charles II. had, for its principal object, the making of municipal laws and regulations to protect the staple manufacture from "abuses, defects, and deceits in the making, selling, and dyeing of woollen cloths." The trade, however, was allowed a happy degree of liberty; no restrictions were placed on settling in the town, or carrying on any business; the corporation, having no property, and little political influence, (seeing that the borough did not return members to Parliament,) remained free from the abuses which stained many other corporations, and simply presided over the police, doing otherwise neither good nor harm. During the Commonwealth, Leeds returned one representative, Captain Adam Baynes, of Knostrop; but on the Restoration that privilege was taken away, and this borough was one of those great and flourishing places, the non-representation of which formed so irresistible an argument for the reform of the House of Commons. By the reform act, Leeds received two representatives. One of its first members was the eloquent Thomas Babington Macaulay, since appointed a member of the supreme council in India; and the other Mr John Marshall jun. It is now represented by Sir John Beckett, formerly Judge-Advocate under Tory administrations, and by Mr Edward Baines, the proprietor, and for many years the editor, of the *Leeds Mercury*, the most extensively circulated, and perhaps the most influential of the English provincial newspapers, now conducted by his son, who is also the author of a History of the Cotton Manufacture.

Leeds has a parish church of great antiquity, but not very remarkable either for its architecture or its monuments. The town has, besides, seven churches (not reckoning those in the out-townships), and numerous chapels belonging to the Methodists, Independents, Baptists, and Unitarians. The Dissenters are a very large body in Leeds; intelligent, active, and influential. There are perhaps few towns of equal size where the moral and religious feeling is stronger, or where there is greater sobriety of temper amongst the inhabitants. The latter characteristic is indicated by the absence of any undue degree of speculation in trade, by popular riots or commotions being almost unknown, and by the temperate and judicious, though decided and influential, part which this town has taken in promoting the cause of civil and religious liberty, and of reform in the national institutions.

Leeds is irregularly built, having no police regulations to enforce any thing like uniformity in building. It has few attractions for the stranger. Yet some of its structures are handsome, and there is a spirit of improvement, which is likely ultimately to remove many of the present defects, and to ornament the town. The Court-house, of the date of 1815, is a handsome stone edifice; and the Commercial Buildings are still more elegant. The town has several commodious markets, an excellent suite of public baths, a good music-hall, and a miserable theatre. Its waterworks are shamefully defective, but new works are contemplated. The town is well lighted by two gas companies. Cavalry barracks were erected a few years since at one of the outskirts. The savings bank is well supported. The charities of Leeds are considerable; several of them, including the free grammar-school, the hospital or almshouses, &c. were either founded or endowed by a munificent public benefactor, Mr John Harrison, who lived in the early part of the seventeenth century, and who also built and endowed St John's Church. Of modern date, are a spacious and well-managed infirmary, a house of recovery for fever patients, a dispensary, a guardian asylum, a lying-in charity, a benevolent or strangers' friend society, Lancasterian and National schools, an infant school, &c. The literary and scientific institutions of the town are very respectable. The Philosophical and Literary Society, founded in 1820, has a good museum, and its building is elegant, though plain. A literary institution, a mechanics' institution, and subscription libraries also exist in the town. A medical school has lately been established, and is supported with talent and success by the physicians and surgeons, so that it has attained some reputation, and its lectures are admitted by the College of Surgeons and the Apothecaries' Company as qualifying the pupils for entering on the profession. The present number of pupils is from forty to fifty. A very elegant and beautiful cemetery, covering nine acres of ground, was constructed in the year 1835, in an elevated situation near the town; and this burial-place, so desirable an appendage to a large town, is likely to be generally used by the inhabitants.

The history of Leeds has been written by two antiquarians,—Ralph Thoresby, F. R. S., a learned and pious native of the town, who published his *Ducatus Leodiensis* in 1714, and the Rev. Thomas Dunham Whitaker, LL. D., F. S. A., who re-published Thoresby's work, and added another volume, under the title of *Loidis and Elmete*, in 1816. The latter work deserves high praise for its ability and antiquarian learning, but it is miserably defective in its notice of the manufactures and trade of the place, and treats them with the most prejudiced contempt. Leeds was the native place of Dr David Hartley, the pupil of Sir Isaac Newton, and author of "Observations on Man:" he was the son of a clergyman at Armley. General Guest, the commander of the King's troops at Edinburgh in 1745, was the son of a Leeds cloth-dresser. Mr John Smeaton, the celebrated engineer, and the architect of Eddystone light-house, was born at Austhorp, in this parish, where his family still reside. Benjamin Wilson, the eminent painter, who flourished about the middle of the last century, was a native of Leeds. The Rev. Joseph Priestley, LL. D., the distinguished philosopher, was born at Bristol, within eight miles of Leeds, and officiated for several years as the minister of the Unitarian Chapel in this town; and during his residence here, a select literary society was formed, of which the Doctor and the late William Hey, F. R. S., an eminent surgeon and a Christian philanthropist, were the most active members: they met for the purpose of philosophical enquiry and experiment. The Leeds Subscription Library originated in the suggestion of Dr Priestley. Leeds gives a ducal title to the family of Osborne, which sprung from this town. Edward Osborne, in the reign of Henry VIII., went from Leeds to be apprenticed to Sir William Hewet, Lord Mayor of London; and having plunged into the Thames to save the life of his master's only daughter, who had fallen into the river from their house on London Bridge, he was appropriately rewarded for his gallantry with the lady's hand. He himself became Lord Mayor of London; and his descendant, Sir Thomas Osborne, Bart., became the celebrated Earl of Danby and Duke of Leeds, and was president of the council in 1689. Leeds is distant 190 miles from London, and 24 from York.

LEEFOGA, one of the smallest of the Hapaee Islands, in the South Pacific Ocean. It is not above seven miles long, and in some places not above two or three broad. There is a reef running to a considerable extent from the east end of it, on which, from being exposed to the trade-winds, the sea breaks with great violence. It was here that in 1800 the *Port-au-Prince* privateer was cut off, and almost all the crew massacred. Long. 185. 40. E. Lat. 12. 49. S.

LEEK, a market-town and parish of the hundred of Totmonslow, in the county of Stafford, 154 miles from London. It is in the neighbourhood of coal mines, which have given rise to manufactures. The making of an inferior description of ribbons has been long a source of employment, and has latterly been extended by the removal of the duty on raw silk. There is a well-supplied market on Wednesday. The population within the town amounted in 1801 to 3489, in 1811 to 3703, in 1821 to 4855, and in 1831 to 6374; but the whole parish, at the latter census, contained 10,780 inhabitants.

LEER, in glass-making. See Glass.

LEER, a city of the province of East Friesland, in the kingdom of Hanover, the capital of a bailiwick of the same name. It is situated on the river Leda, near its junction with the Ems, and is a well-built town, containing three churches, a synagogue, 739 houses, and 5514 inhabitants. It is a place of active trade in corn, with extensive distilleries and breweries, several oil-mills, and fabrics of linen, soap, and leather. The harbour is adapted for vessels not exceeding 150 tons. Long. 7. 20. 10. E. Lat. 53. 13. 43. N.

LEES, the grossest and most ponderous parts of liquors, which, being separated by fermentation, fall to the bottom. The word comes from the French *lie;* and that either from *limus*, mud, or from *Lyæus*, one of the surnames of Bacchus; or, according to Du Cange, from *lia*, a corrupt Latin word signifying the same thing. The vinegar-makers carry on a great trade in the lees of wine dried and made into cakes, after having squeezed out the remains of the liquor in presses.

LEETAKOO, or Lattakoo, the capital of the Boshuana territory, in Southern Africa. The old town of this name, when first visited in 1801, contained from 10,000 to 15,000 inhabitants, who had made some advancement in the arts of civilized life; but in consequence of a schism in one of the tribes, the inhabitants removed to a place about sixty miles farther north. New Leetakoo is supposed to contain about 6000 people.

LEEUWARDEN, a city, the capital of the province of Friesland, in the Netherlands, and of the circle of the same name in that province, which contains ten cantons, with 95,000 inhabitants. The city is situated on a canal which proceeds to Dockum, is well built, with clean, wide streets, intersected by several canals. The chief edifices are the stadthouse and the palace of Orange. It is fortified, and contains 1900 houses, with a population (in 1830) of 20,938 persons, viz. 9857 males, and 11,081 females. It has a considerable trade in making linen goods, paper, and cloth, and is the great market for Friesland horses. Long. 5. 54. E. Lat. 53. 17. N.

Leeward Ship signifies a vessel that falls much to leeward of her course when sailing close-hauled, and consequently loses much ground.

To Leeward, towards that part of the horizon which lies under the lee, or whither the wind blows. Thus, "We saw a fleet *under the lee*," and, "We saw a fleet *to leeward*," are synonymous expressions.

LEGATE, a cardinal or bishop, whom the pope sends as his ambassador to sovereign princes. There are three kinds of legates, viz. legates *a latere*, legates *de latere*, and legates by office, or *legati nati*. Of these, the most considerable are the legates *a latere;* the next are the legates *de latere*. Legates by office are those who have not any particular legation given them, but who, by virtue of their dignity and rank in the church, become legates. Such are the archbishops of Rheims and Arles; but the authority of these legates is much inferior to that of the legates *a latere*.

The term *legate* comes from *legatus*, which Varro derives from *legere*, to choose, and others from *legare*, *delegare*, to send, to delegate.

Court of the Legate was a court obtained by Cardinal Wolsey from Pope Leo X. in the ninth year of Henry VIII. in which he, as legate of the pope, had power to prove wills, and dispense with offences against the spiritual laws. It was but of short continuance.

LEGATUS, a military officer amongst the Romans, who acted as deputy of the commander-in-chief. The *legati*, at their first institution, were appointed not so much to command as to advise; and they were generally chosen by the consuls, with the approbation of the senate. As to the number of the *legati* we have no certain information, though we may upon good grounds assign one to every legion. In the absence of the consul or proconsul, they had the honour of the *fasces*. Under the emperors there were two sorts of *legati*, *consulares* and *prætorii*. The former commanded whole armies, as the emperor's lieutenants-general; the latter had the command of particular legions. The *legati* under the proconsuls in the provinces served for judging inferior causes, managing smaller concerns, and remitting things of great moment to the governor or president himself. This, as above hinted, was originally the duty of the *legati*, though, as we have also seen, they were afterwards admitted to command in the army.

LEGEND, any idle or marvellous story told concerning saints, and other persons.

The legend was originally a book used in the churches, containing the lessons to be read at divine service; and hence the lives of the saints and martyrs came to be called *legends*, because chapters were read out of them at matins, and in the refectories of religious houses. Amongst these, the golden legend, which is a collection of the lives of the saints, was received with great applause in the church, where it maintained its ground for two hundred years; though it is so full of ridiculous and romantic stories, that the Romanists themselves are now ashamed of it.

Legend is also used by authors to signify the letters or words which are engraved round the margins and other parts of coins.

Legend is likewise applied to the inscription of medals, which serves to explain the figures or devices represented on them. In strictness, the legend differs from the inscription, which properly signifies words placed upon the reverse of a medal, instead of figures.

It seems as if the ancients had intended their medals to serve both as images and as emblems; the former for the common people, and the latter for persons of taste and parts; the images to represent the faces of princes, and the emblems their virtues and great actions. Hence the legend is to be looked upon as the soul of the medal, and the figures as only the body.

Every medal has properly two legends; that upon the front, and that upon the reverse. The former generally serves to distinguish the person by his name, titles, offices, and the like; the latter is intended to express his noble and virtuous sentiments, his good deeds, and the advantages which the public has reaped from them. This, however, does not hold universally; for we sometimes find the titles shared between both sides, and sometimes also the legend.

In the medals of cities and provinces, as the head usually represents the genius of the place, or at least some deity adored there, the legend contains the name of the city, province, or deity, or of both together; whilst on the reverse is some symbol of the city, frequently without a legend, sometimes with that of one of its magistrates.

LEGERDEMAIN, a denomination given to certain deceptive performances, which either depend altogether on dexterity and address, or derive but a small degree of aid from philosophical principles.

LEGER Line, in *Music*, one added to the staff of five lines, when the ascending or descending notes run very high or very low. There are sometimes many of these lines both above and below the staff.

LEGHORN, properly Livorno, a commercial city of the duchy of Tuscany, in Italy. It stands on the sea-shore, near the island of Melora, which, by its castle, defends the entrance of the harbour. It is surrounded by strong walls on every side; but towards the land these are thought to be untenable, from being commanded by neighbouring heights. The outer harbour has not depth of water for ships of more than 400 tons burden. It is surrounded by a long mole, the efficiency of which is lessened by the great quantity of sand brought in by the west and the north winds. The inner harbour, called Darsena, is only used for repairing ships, and for the reception of fishing boats and small craft. The river Arno connects Florence with the harbour of Leghorn. It is a well-built city, with many massive houses, which, if not elegant, are well calculated for a mercantile place. There is a ducal and an episcopal palace, many churches and hospitals, and more than 6000 houses, with 72,924 inhabitants. One third of the population consists of Jews, who are enclosed in a separate quarter, but otherwise enjoy greater privileges than in almost any other part of Italy. The trade is very extensive, and much ingenuity is applied to several branches of manufactures of a minute kind, such as works in coral, ivory, and marble, in distilling liqueurs, in preparing snuff, cream-of-tartar, soaps, starch, powder, leather, shot, and other articles. It is, next to Marseilles, the most extensive sea-port in the Mediterranean, and it is visited by ships from England, France, America, and the northern countries of Europe, and has considerable shipping belonging to its merchants, who trade chiefly with the towns in Northern Africa. The following table will show the several nations whose commerce with this port is carried on by their own vessels.

Statement of the Number of Vessels, distinguishing the Countries to which they belong, that entered the port of Leghorn in each of the Years 1829, 1830, *and* 1831.

Countries.	1829.	1830.	1831.
British	189	219	193
French	156	171	180
Russian	4	47	47
Swedish	34	29	29
Danish	12	10	10
Dutch	6	6	12
Austrian	30	152	106
Spanish	21	27	13
American	27	29	29
Neapolitan	194	235	266
Sardinian	898	698	686
Tuscan	1424	1336	1257
Lucchese	115	106	81
Roman	71	50	32
Greek	13	47	32
Hanoverian	3	...	...
Ottoman	...	2	...

The far greater proportion of Neapolitan, Sardinian, Tuscan, Lucchese, and Roman vessels, consists of small coasting craft, of from fifteen to twenty tons burden.

Account of the British Vessels that cleared out, with their Tonnage and Crews.

Years.	Ships.	Tonnage.	Crews.
1829	148	22,675	1381
1830	169	26,362	1627
1831	154	24,188	1468

The lighthouse is in longitude 10. 11. 25. E. latitude 45. 33. 5. N.

LEGION, in Roman antiquity, a body of foot, which consisted of different numbers at different periods of time. The word comes from the Latin *legere*, to choose; because, when the legions were raised, they made choice of such of the youth as were of the proper age to bear arms.

In the time of Romulus the legion consisted of 3000 foot and 300 horse, although, after the reception of the Sabines, it was augmented to 4000. In the war with Hannibal it was raised to 5000; after which it declined to 4000 or 4500, the number in the time of Polybius. The number of legions kept in pay together differed according to times and occasions. During the consular state, four legions were organized every year, and divided between the two consuls; yet we meet with as many as sixteen or eighteen, according as the situation of affairs required. Augustus maintained a standing army of twenty-three or twenty-five legions; but so large a number is seldom found in after times. The different legions borrowed their names from the order in which they were raised, thus *legio prima, secunda, tertia*: but as there might be many *primæ, secundæ, tertiæ*, they were surnamed from the emperors, as *Augusta, Claudiana, Galbiana, Flavia, Ulpia, Trajana, Antoniana*; or from the provinces which had been conquered by their means, as *Parthica, Scythica, Gallica, Arabica*; or from the deities under whose protection the commanders had particularly placed themselves, as *Minervia, Apollinaris*; or from the region where they were quartered, as *Cretensis, Cyrenaica, Britannica*; or from particular accidents, as *adjutrix, martia, fulmi-vatrix, rapax, victrix*. Each legion was divided into ten cohorts, each cohort into ten companies, and each company into two centuries. The chief commander of the legion was called *legatus* or lieutenant.

The standards borne by the legions were various. Originally the standard was a wolf, in honour of Romulus's nurse; afterwards a hog, which animal was usually sacrificed at the conclusion of a treaty, to indicate that war is undertaken with a view to peace; sometimes a minotaur, to remind the general of his duty of secresy, of which the labyrinth was an emblem. The figures of a horse and a boar were also borne; and Marius, we are told, was the first who exchanged all these for the eagle. See Army.

LEGISLATION.

The word Legislation is used in two senses; the one ancient, the other comparatively modern. In its ancient and most ordinary acceptation, it comprehends the science of law, as law ought to be; explaining the principles from which law should be universally derived, and also the rule to be observed in the application of those principles to particular countries. In its much more recent and restricted sense, it is made to represent as much of the contents of the municipal laws of a country, and as much only, as is created immediately by the supreme authority, acting in its legislative capacity. In either case, it is equally distinguished from the several meanings which have, at different times, been given by the majority of writers, to the word Jurisprudence. For instance, the science of legislation (or what law *ought to be*) is carefully separated by Mr Austin, in his *Province of Jurisprudence*, from the science of jurisprudence (or the qualities which are common to all laws,—what law therefore *is, and must be*), which it was the characteristic object of Mr Austin's lectures to interpret. Again, legislation, in both of the above senses,—whether used as meaning the science of perfect laws, or as descriptive of that portion of the body of any law which has emanated from the legislature itself,—is manifestly a very different subject from the jurisprudence (*prudentia juris*) of the Romans. In their written wisdom, jurisprudence was understood in its more primitive acceptation; in the meaning, in short, which with most persons and for most purposes it still retains, namely, that of a general and scientific knowledge of the laws, whatever they may be. There is a third and later meaning of jurisprudence, in which it is narrowed down to the usage of the courts. This application of it is of French invention, having been manufactured by them, in technical opposition to an equally peculiar construction which they had put upon the word legislation. This was done with the view of distinguishing between the positive letter of the codes (termed "legislation Française") and judicial decisions; which latter division of their laws they consequently thought fit specially to characterize by the name of jurisprudence. It is plain, therefore, that upon most occasions, legislation and jurisprudence will mean different things. But, on comparing legislation in the first and usual sense, as above mentioned, with the description of natural or universal jurisprudence, as copied in a succeeding paragraph from Adam Smith, it will appear that, until we come to the modifications introduced by particular legislation, these two sciences are substantially the same.

Man by the very constitution of his nature is social, and society supposes government. Investigations into the origin of government (as, for instance, whether, at its commencement, it was patriarchal or military) are amongst the creditable amusements of conjectural philosophy. But they are amusements only, when compared with practical criticisms on the form and the spirit of particular political institutions, or with the higher reasonings by which the true principles of a sound constitutional system are developed and determined. All political institutions are artificial constructions, admitting of great variety. But they may be brought under one or other of two comprehensive classes; since, in whatever hands the supreme authority of a state is lodged, it must be founded either on the partial interests of certain individuals, more or less numerous, or on the general interest of the whole community. According to which of these classes a government may happen to belong, there will be considerable difference in the aspect and object of its legislation; but from the moment one or two are gathered together into a society, their most pressing necessity is that of ascertaining or making the laws upon which the social interests of its members are henceforward to depend.

The universal elements of the science of legislation would seem to be sufficiently simple. Depending on the nature of things and of man, it may be thought there could be no mistake. Unfortunately, the history of the human race has not been so reasonable and so straightforward. It was late before the nature and condition of man, either as an individual or as a member of society, were analysed, with the view of determining the choice between opposite means of happiness, or of ascertaining the rules of justice. In process of time most of these questions were settled more or less rudely by the respective societies, without much consultation amongst each other. It was still later before the thought occurred of forming into a general system the common principles which all nations might be expected to adopt. Barbarism and sophistry had had such long possession, and had so confused and complicated the subject, that to discover these common principles is the great, and indeed arduous object of philosophical legislation.

Looking at legislation with the help of philosophy and history, it is evident that its uniformity has always been, and must always continue to be, disturbed by two causes, to a certain degree independent of each other. These are, the form of government, and the state of civilization. The contemporary tendency and character of laws will vary with the frame and nature of the political organization which has been employed in their manufacture. Much more will they vary with (as in truth the substance of them is necessarily derived from) the condition physical and moral, the intelligence and the public virtue, of each particular community.

The rules of municipal law are “in general intended,” says Adam Smith, “to coincide with those of natural justice. It does not indeed always happen that they do so in every instance. Sometimes what is called the constitution of the state, that is, the interest of the government, sometimes the interest of particular orders of men who tyrannize the government, warps the positive laws of the country from what natural justice would prescribe. In some countries the rudeness and barbarism of the people hinder the natural sentiments of justice from arriving at that accuracy and precision which, in more civilized nations, they naturally attain to. Their laws are, like their manners, gross, and rude, and undistinguishing. In other countries the unfortunate constitution of their courts of judicature hinders any regular system of jurisprudence from ever establishing itself among them, though the improved manners of the people may be such as would admit of the most accurate. In no country do the decisions of positive law coincide exactly, in every case, with the rules which the natural sense of justice would dictate.” The extent to which he conceived these aberrations to have proceeded appears in another passage. Speaking of the civil and criminal law of particular countries, he observes, “the principles upon which those rules either are or ought to be founded, are the subject of a particular science, of all sciences by far the most important, but hitherto perhaps the least cultivated,—that of natural jurisprudence.” Adam Smith calls the work of Grotius not only the first, but “as yet the most complete,” on this subject. The legislative writings of Mr Bentham (which have no necessary connection with his theory of morals) will form an equal era.

Robert Hall observed of Mr Bentham, that “in the particular province of his speculations, the science of legislation, he had advanced the limits of reason; and that if he were compelled to legislate for the world upon uninspired principles, he should take Bentham, and go from state to state with as firm a step as though he walked upon a pavement of adamant.” Had this eminent preacher given as much attention to law as to divinity, he would have seen that some further deduction should be made from this unlimited panegyric. There are striking warnings scattered over Mr Bentham's treatises upon legislation, of the respect due to both the disturbing causes above mentioned. But the general effect left, both by the matter and manner of his writings, upon most minds, is on one important point (that of domestic legislation) inconsistent with the forbearance and caution which he otherwise inculcates. For instance, an ardent disciple, impregnated with his principles, might be induced to alter the laws of his own country at once too suddenly and too far, and, when the alteration was made, to err equally in inferring that it was made for ever. Yet Mr Bentham was fully aware of the nature of the limitations and variations by which his general theory ought to be accommodated to practice. An express dissertation on the influence of time and place on subjects of legislation is set apart to the solution of the problem, how, the best laws being given, the legislator ought to modify them according to temporary and local considerations? There is nothing to add to his observations and admissions on the necessary effect of *change of place*, with reference to the propriety of transplanting laws from one people to another. He saw the difficulty of English law-making for India. But a great deal, we think, is wanting in his sketch of the probable effect of *change of time* in preventing the same laws from being equally suited to distant generations of the same people. He restricts this effect to the constitutional code, excluding almost entirely the civil and criminal codes from its operation. Montesquieu's Spirit of Laws, and the Treatise on Legislation by M. Comte, are excellent repertories of the principal facts by which travellers have established the variety that exists amongst the families of the human species scattered over the globe. The differences between the extreme limits of our common nature (to which differences all rational legislation will conform) are indeed immense. It was in this point of view that Burke received the lessons contained in Dr Robertson's History of America, and felt their application to all who have to take part in the government of man. The British statesman has acknowledged his obligations to the historian of the new world, in language which those of his countrymen who are bent on judging of all institutions by their own standard, and on assimilating all nations to themselves, would do well to recollect. “I have always thought that we possess at this time very great advantages towards the knowledge of human nature. We need no longer go to history to trace it in all stages and periods. History, from its comparative youth, is but a poor instructor. When the Egyptians called the Greeks children in antiquities, we may well call them children; and so we may call all those nations which were able to trace the progress of society only within their own limits. But now the great map of mankind is unrolled at once, and there is no state or gradation of barbarism, and no mode of refinement, which we have not at the same moment under our view: the very different civility of Europe and of China; the barbarism of Persia and of Abyssinia; the erratic manners of Tartary and of Arabia; the savage state of North America and of New Zealand.”

All this is very true, and yet a given race may be no more a fixed quantity (the proper subject of an identical legislation) than the human species itself. The historian of the old world has not, owing to the effect of lapse of time, his evidence as accessible as was the case with the historian of the new, in respect of a removal from one hemisphere to another. It should be observed, however, that it happened in the instance of the natives of America, that both the causes were at work. As to the extent of the changes wrought by time in the condition and character of the same nation, whilst dwelling on the same soil, nobody can doubt. And the legislators of successive periods must notice and follow out these changes, upon principles precisely similar to the precautions by which transplanted legislation is controlled. No greater suffering can be inflicted on a progressive people, than by the attempt at constructing immutable laws on the supposition of this partial immutability of nature. A system of uniformity and contraction which might fix for ages, as in a mould, some strangely stationary races (the Jews, the Medes and Persians, or the Chinese), must have been torture to the Greeks even of Sparta. If the Twelve Tables had been the perfection of appropriate legislation in the age of the Decemvirs, there can be no question but that Justinian's Institute was more in harmony with the contemporaries of Tribonian. It is probable that the Koran may not have been, even from the first, the best possible system for the followers of Mahommed. Supposing it to have been so, it is very certain that, through every change of circumstance, it could not remain the best for their descendants. Instead of stipulating, like the Locrians, that the man who at any time proposed a new law, should do so with a halter round his neck, when Locke undertook to legislate for Carolina, it was on the understanding that his laws were to be revised at the expiration of a hundred years. At the present moment, in all those moral and social qualities with which the law is concerned, the Hindu is not much more remote from the European than the actual generation of artificial Englishmen is separated from the Anglo-Saxon hordes, whom, nevertheless, they represent, in blood, in language, and in soil. Adam Smith is for putting a more extended meaning than Bentham and De Tracy will allow, on the celebrated saying of Solon, that he had given the Athenians, if not the best laws, the best that they could bear. We should say indeed that we know of no such thing as an abstract best in positive legislation. Best for them, is in their case best. To ascertain Mr Bentham's opinion, however, on this, as on other subjects, the whole body of his writings must be taken together. Otherwise, on looking at his personal ambition for becoming the legislator of almost every nation under heaven, and at his hypothesis, that no person was likely to legislate for a country so well as a stranger, it might be inferred, that he was disposed too hastily to pull down or to overleap the great partition-wall of national distinctions. In the same manner, the prospect on the effect of time, so narrow in the chapter alluded to, is elsewhere enlarged, until it embraces every distant contingency we could desire. Mr Bentham is aware that a periodical revision of its provisions will be a necessary supplement to a code. He was apparently unconscious of the property of accommodation which the admirers of the common law have discovered in its popular and malleable nature. So, in his first letter to Mr Madison, in 1811, after observing that the common law was nothing but "an ideal and shapeless mass of merely conjectural and essentially uncognoscible matter," he proceeds to complain of it as unfitted to our actual wants: "Law, which being, in so far as it could be said to be made, made at a multitude of successive periods, and for the use and governance of so many different generations of men,—men imbued with notions, habituated to modes of life, differing more or less widely from each other, as well as from those which have place at present,—would, even had it been well adapted to the circumstances and exigencies of the times in which its parts came respectively into existence, have, to a considerable degree, been thereby rendered, not the *better* adapted, but by so much the *worse* adapted, to the notions and manners *now* prevalent, to the state of things *at present* in existence." Admissions more extensive than these as to the vast alterations which the quiet hand of time, passing over the body of the laws and the character and condition of a people, must necessarily produce, severing them from each other wider and wider, even modern English law-makers, who are never easy but when tinkering at an act of parliament, could not possibly require.

The word law, in its proper and original sense, carries with it the notion of a superior. This intimation of supremacy is the principal quality conveyed in the widest definition of law, namely, "the expression of a will by a command." In this point of view the authoritative interposition of conscience enables moralists who adopt the theory of conscience to speak with perfect correctness of the law of morals. In their mouth it is no metaphor. What is the nature of the will, or of the command which may be coupled with the law, is an entirely distinct consideration. A frequent source of misconception (that of false analogies) would have been avoided, if writers had more carefully separated the several meanings in which the word *law* is used. Above all, there are two meanings, between which it is important to discriminate; one in which the difference consists in the subject of the laws, the other in their author. The first division is formed by the distinction between matter and the mixed human constitution,—between the passiveness and uniformity of matter, and the free agency and the consequent variableness of imperfect man. Hence originates the complete disseveration of those laws of the material world, which simply represent *what is*, from the laws of the moral world, which represent *what ought to be.* The laws of the material world are physical phenomena stated in a general proposition. The occurrence of a single exception would disprove the law. The laws of ethics, although really derived from and dependent upon human nature, presuppose a moral assumption with which the facts are to coincide. Accordingly, they will continue equally to be the laws of our moral being, even whilst they are violated every day. The second division is formed by the distinction between a perfect and imperfect legislator: between the legislative attributes of God and the legislative attributes of man. If Montesquieu had observed the first of these divisions, he probably would not have put in apposition so many different senses of the word law as are used in the following sentence, nor have left his readers to infer that the same word on these several occasions meant always the same thing: "The Deity has his laws: the material world its laws: intelligences superior to man their laws: the brutes their laws: man his laws." Attention to the second division would have protected Blackstone from quoting the description given by Cicero of the law of nature or morals as synonymous with that of positive or municipal law.[1] Speaking of municipal law, he has made the fact of law or no law depend upon its nature. According to the latter member of his definition, there can be no such thing as a bad municipal law; for he defines it to be "the rule of civil conduct prescribed by the supreme authority in the state, *commanding what is right, and prohibiting what is wrong.*" The consequence of so fallacious a proposition at the threshold, has been just what might have been expected. A mischievous confusion between particular and general jurisprudence pervades and perverts the whole of his elementary chapter. An assertion of this kind is unfortunately contradicted at once by the experience of great portions of mankind. A particular law, issuing from the supreme authority of the state, does not cease to be the law within the territories of that state, as long as the supreme authority is strong enough to enforce it, although it should command what is wrong, and prohibit what is right. Nevertheless, a lawgiver approaches to perfection only in proportion as he succeeds in his attempts to realize the other attributes of God; the attributes of goodness and of wisdom, as well as the coarser attribute of power. Goodness is wanted in order to supply general rectitude of intention; wisdom, in order to estimate the value of every specific end, and the aptitude of the means. A government with good intentions will propose for its object the happiness of the governed. But a government must be wise as well as good to enable it to discover the precise measures by which this object will be most effectually promoted.

One of the principal provisions of what is called constitutional law is, to organize such a system of electoral legislation as will return to the legislature a representative body, so identified in interest with the people as almost to guarantee rectitude in their intention. The wisdom of their measures will be in proportion to the statesmanlike knowledge of the individual members of whom the legislature is composed; their personal attainments being combined with and helped out by the knowledge of the persons whom they may happen to consult. It is improbable, for many reasons, that a legislature, and more especially a popular legislature, should at all times, or even at any time, possess a competent degree of knowledge wholly within itself. But there are no limits to the assistance from without which the supreme authority of a state has always at command. It need not be afraid of asking for advice. The doctrine of its supremacy can want no farther recognition than that it should keep the ultimate sanction and revision of the laws in its own hands. In this way it may accomplish much by means of foreign assistance. But if a legislative assembly is to have the full benefit of the ability of its own members, it must proceed, by a proper division of legislative labour, to distribute the work which it reserves for its own body, into appropriate departments. A prudent distribution of labour, although indispensable for preparing and digesting the materials, will not be enough. The deliberative assembly must, by well-considered regulations, secure the freedom and order of its own discussions. This done, no further condition regarding mere arrangements can be required, than that skilful draughtsmen should be called in for the mechanical operation of putting the meaning of the legislature into becoming form and language. The criminal laws of all countries, and even the civil laws of some, proceed upon the hard (although, in the first of these cases at least, the indispensable) presumption, *ignorantia legis neminem excusat.* It is clearly, therefore, an act of bare justice to the inhabitants of every country, first, that its laws should, as far as possible, be drawn up in such a manner as to be capable, with due attention on the part of sensible persons, of being correctly and completely understood; and next, after being made intelligible, that by due promulgation they should be made known.

---

[1] Blackstone, 44, 122.

Amongst ourselves, the proceedings of the British parliament have forced the attention of thinking men, and must, sooner or later, force the attention of the public, upon these latter topics. One of our wants has been ably stated by Mr Wickens, in " an argument for more of the division of labour in civil life in this country." The height to which the grievance has grown can never be more strongly signified than in the extravagance of the suggestions which the late Sir John Sinclair made for its redress. The truth is, that the supreme legislature, or British parliament, occasionally troubles itself about many things which do not properly fall within the province of government at all. For the province of government has been properly defined to be " that of promoting the happiness of the community associated under it, by such measures as cannot be undertaken by individuals, or subordinate associations for themselves, or cannot be undertaken with equal advantage."[1] But, on our present system, we employ a steam-engine to crack nuts. We are frequently seen wasting the whole powers of the council of the nation over questions of a partial or local nature, with which (supposing them to be within the province of government) the supreme legislature at all events ought not to have interfered. These are the hundred minor matters which never came before the legislature until comparatively recent days; and which would have been in every way infinitely better disposed of, if they had been left to the discretion of subordinate jurisdictions, subject only to the supremacy of the state. With respect to such general measures as it is necessary to reserve, in the first instance, to the discretion of the supreme authority itself, it is equally clear that its work would be often done with incomparably greater ease and efficiency by a more prudent division and application of its force.

On this head, Mr Symonds, in a very judicious work entitled *The Mechanics of Law-making, intended for the use of Legislators, and all other persons concerned in the making and understanding of English Laws*, observes, that " in the progress of invention, schemers often discover new principles, that are fruitless, for the want of mechanical knowledge or skill to develope them in some tangible form. So our legislators often dream wisely, and talk after the fashion of their dreams; but, from ignorance and want of skill in the workmanship of details, which they leave to the routine performance of mere artisans, they seldom succeed in giving to the people a law intelligible either to themselves or the persons for whose especial guidance the law was designed. The beauty of a piece of mechanism is shown in the completeness of all its parts, and their combined action towards one grand general result. There is nothing excessive, nothing wanting. Each part has its special use, and is indispensable. Apply these principles to the English laws, what are they? The clumsiest pieces of workmanship which the unskilled labour of man ever made." " Our laws are written on different methods by different persons. Even those which should be, as the single act of the legislature, corresponding in spirit, structure, and terms, to other acts of the same body, are often antagonist to each other. The statutes of a single session contain every variety of anomaly that can be embraced in that species of composition. This must be the case till the legislature shall appoint persons to draw or revise all laws; to couch them in an uniform expression; or, at least, to take care that there be no difference in form where the substance is the same. If the time should ever arrive when our legislature shall, in its wisdom, determine on the adoption of such an expedient, it would be necessary that it should be preceded by a statute of directions, governing the arrangement, style, and character of our acts of parliament." Many enactments, which by their subject ought to be, and might be, perfectly accessible to the people at large, are made exclusive matters of professional knowledge, by the want of method, and by the exuberant phraseology in which the sense of almost all enactments is lost at present. Were the substance of parliamentary legislation as good as possible, its value would be infinitely lessened to us by the state in which it is issued to the world. The English statute-book is a vast jungle of technical tautology. The remonstrances of the late Lord Colchester, as far back as 1797, and the improved example of America, have hitherto been made in vain. Notwithstanding the criticism of Mr Miller in his right-minded book on the civil law, upon the precipitancy with which bills are hurried through the House; notwithstanding the suggestions and the specimens towards an amendment in the plan and language of our enactments, published ten years ago by Mr Uniacke and Mr Twiss; the statutory system of 1835 is shown to be just as bad as that of 1830. The impolicy and insufficiency of the principal arrangements of our legislation can of course be satisfactorily met only by corresponding changes. The following propositions are made by Mr Symonds, as comprising, in his opinion, the very minimum of what is necessary for any adequate reform. " There shall be some individual or individuals employed in the preparation of the information connected with every proposed new law, before it is formally proposed to the House; that the information so prepared should be submitted to a committee, who should report on the state of the matter, with a view to guide the House as to its further determination; that if the law should be determined upon, it should pass the usual stages of proceeding, being, however, before the second and third readings, reported upon by an officer charged with the verbal revision of its terms; that the law being passed, the heads of the department of the executive to which it relates, and other heads to be appointed specifically for the functions of public instruction, the administration of the law, religion, and justice, should superintend the promulgation and operation of such law; for which purpose, all questions arising upon it should be reported to such chief officer, by a regular body of reporters, attached to the courts of justice, and by the law officers of departments, where the matter should be determined upon by petition or memorial, without appeal to the courts of justice. There being a systematic report of all questions arising in the courts on each branch of the law, and fixed committees of the legislature to report upon such questions, the work of amendment would follow as of course. It would not be safe to omit any one of these parts of the machinery. They should all exist, acting in connection with each other, not for a season only, but throughout all time. The efficiency of the machine depends on its wholeness and permanence." From the absence of all counteracting provisions of this description, parliamentary legislation has fallen into such disorder, that the excellence of the regulations long ago adopted by the House of Commons, for securing the freedom and order of its deliberations, yield comparatively imperfect fruits. The wisdom of these regulations has been pointed out by Mr Bentham, with his usual comprehensiveness and minuteness, in his searching notice "upon the tactics of legislative assemblies." To use a humble illustration, there may be no fault to find either in the market or in the kitchen; the victuals may be good and the cookery excellent; yet the dinner may be spoiled by the dishing up, by the vessels into which it is put, and the manner in which it is served at table.

---

[1] See on this point the *Rationale of Political Representation*, by the author of *Essays on the Formation of Opinions*.

A good *redaction* of laws is absolutely essential to their working well. Therefore, if the above censure of the English system of parliamentary legislation were only sufficiently near the truth to be even a plausible account of it, it would be pretty clear that there is no necessary connection between a representative government and a judicious method of framing laws. But the objection, as stated, principally applies to the mode in which this description of business is transacted in parliament, and to the form into which the results are thrown. Will the experience of English legislation, however, justify an observer in confining his criticisms within these bounds? Quite the contrary. It is equally clear, from the nature of the case and from experience, that a popular assembly, unless it adopt systematic arrangements for its guidance (somewhat similar to those suggested by Mr Symonds), must fall as far short in its competence to undertake the substance of some, at least, of its principal duties; for instance, the greatest of all,—the civil and criminal law,—with a view to their character and their improvement. With regard to its superintendence of the criminal law, the following was Blackstone's account of the matter as it stood in his day, and he was a writer not likely to exclaim without provocation. "The enacting of penalties, to which a whole nation should be subject, ought not to be left as a matter of indifference to the passions or interests of a few, who, upon temporary motives, may prefer or support such a bill, but be calmly and maturely considered by persons who know what provisions the laws have already made to remedy the mischief complained of, who can from experience foresee the probable consequences of those which are now proposed, and who will judge without passion or prejudice how adequate they are to the evil. It is never usual in the House of Peers even to read a private bill which may affect the property of an individual, without first referring it to some of the learned judges, and hearing their report thereon. And surely equal precaution is necessary when laws are to be established which may affect the property, the liberty, and perhaps even the lives of thousands. Had such a reference taken place, it is impossible that in the eighteenth century it could ever have been made a capital crime to break down (however maliciously) the mound of a fish-pond, whereby any fish shall escape, or to cut down a cherry-tree in an orchard. Were even a committee appointed but once in a hundred years to revise the criminal law, it could not have continued to this hour a felony, without benefit of clergy, to be seen for one month in the company of persons who call themselves or are called Egyptians." "It is a melancholy truth, that among the variety of actions which men are liable to commit, no less than an hundred and sixty have been declared by act of parliament to be felonies without benefit of clergy, or, in other words, to be worthy of instant death." Things have changed a little in this respect since Blackstone wrote. But in the way in which the change has taken place, nothing has transpired to affect the inference which Blackstone's language more than intimates to his reader. The inference can be nothing short of this: that a popular assembly is qualified neither morally nor intellectually for the responsible office of fixing the criminal law. Supposing it to be incompetent to the comparatively easy task of criminal legislation, the function of settling the principles and the detail of the civil law must, in the nature of things, lie still further beyond the sphere of its capacity. The civil laws of all countries have been, up to a certain point, more early established than the criminal; they strike their roots far deeper into the most intimate interests and relations of private life; they are complicated with the authority of precedents and the subtlety of refinements, such as do not enter at all into the plain and palpable objects of criminal provisions. They are accordingly everywhere vastly more voluminous. This is the spirit of the explanation given by the Chancellor d'Aguesseau, in his Mistakes on Law, on the disproportion which exists both in the digest and the code, between the space appropriated to private and to public law. Out of fifty books of the Digest, more than forty are given up to the former. If a popular assembly cannot move the lesser weight, it is not likely to intermeddle satisfactorily with the greater. The consequence is, that whatever reforms of any importance have taken or are taking place in England in either of these the principal departments of the law, they are altogether owing to the labours either of individuals or of commissions. A survey of the legal history of other countries corroborates the results of our experience at home. On comparing the state of the civil or criminal laws of two countries, the merit of their systems will not be found to vary directly as their freedom. On many occasions the interposition of a numerous assembly only retards and spoils. The operation is too scientific and delicate a one for popular hands. Bentham says expressly, that he undertook what is generally considered as the greatest of all his writings, that he might show that the tissue of laws, easy to be torn and difficult to be repaired, should not be delivered over to rash and ignorant workmen. In this point of view, arbitrary rulers have considerable facilities for prompt and extensive legislation; and, within the limits to which the above comparison is restricted, they have no temptation to abuse their advantages. Hardly any government can be conceived, in which the interest of the governors and of the governed does not for the most part coincide. When the most absolute governments go wrong concerning them, it is not for want of will to go right, but from the want of knowing better. If this be the case, and nevertheless a far greater amount of happiness be found, upon the whole, amongst free communities, of what vast importance to mankind are the inspiriting questions of constitutional law, and how inestimable are the health and animation breathed into a society by the very air of freedom. The public have to pay dearly for the pleasure which servile politicians may derive from the foolish couplet of the poet:

> For forms of government let fools contest:
> Whate'er is best administered is best.

The cause of truth, however, has much to lose and nothing to gain by any exaggeration. The zeal, therefore, of writers who attribute too much to the influence of government, is to be not less deprecated than the sophisms of others who attribute to it too little. Thus far is certain, that allowing the principal sources of human happiness to be naturally independent of all legislatures, and that, therefore, but little happiness can be directly originated by a government, its means for doing evil are immense. A good government, then, has this incalculable advantage; it protects the natural sources of human happiness from the invasion of others, and abstains from invading them itself. Half-truths are made whole falsehoods by precipitate generalizations. A comprehensive consideration of the proper objects, and of the effective capabilities of legislation, would have prevented the opposite errors; that of a depreciating despondency, as well as that of extravagant expectations. Living in England, Dr Johnson underrated the importance of the difference between institutions and laws of one kind or another. He saw that, compared with other sources of enjoyment, they were productive of but little immediate good; and he appears to have consequently inferred that they could also be productive but of little evil. On the other hand, Filangieri, living at Naples, was a daily witness of the infinite misery arising out of mis-government. He seems to have consequently supposed that legislatures had the power of creating prosperity and happiness in the same proportion. This account of the matter, although probably the true solution of the particular contradiction which we are noticing, stops short of the point at which the principal difference between the two classes of government will be most marked; their good faith in the execution of their laws. Laws cannot execute themselves. Therefore, whatever may be the comparative merit of two systems upon paper, it may be taken for granted that, if the one contains constitutional guarantees which are wanting in the other, there will be all the difference in the world in their practical results. It is certain that no government can long continue to be well administered, the good administration of which is not protected by guarantees. As far, therefore, as the very substance of the law is concerned, political arrangements for this purpose are indispensable conditions to the truth of Dr Paley's conclusion, "that *that* people, government, and constitution is the *freest* which makes the best provision for the enacting of expedient and salutary laws."

But the substance of the laws is not the only object of national legislation. A thing of still greater consequence is the spirit and character of the people. Civil liberty, however explained, is not sufficient of itself. There is great difference amongst jurists as to the proper meaning of the expression, *civil liberty*. If Mackintosh (on the correction of the phrase *jus gentium* for that of *jus inter gentes*) could reasonably doubt whether that particular innovation in a scientific term was one of those which repaid us, by its superior precision, for the uncertainty and confusion which the change occasioned, the same doubt must apply much more strongly in the present instance. It is not only important for the science of legislation, that a term supposed by many to imply its principal object,—but it is important, with a view to our vulgar and daily practice, that a term which is popularly used as the test of good government,—should be uniformly understood. Mr Austin has latterly defined civil liberty (and the language of Destutt de Tracy comes to the same thing) to be, "the liberty from legal obligation which is left or granted by a sovereign government to its own subjects." (*Province of Jurisprudence*, p. 279.) Thus, comparing two communities with each other, he would say that the degree in which they respectively enjoyed civil liberty depended upon their comparative freedom from legal restraint. According to this definition, it might happen that, in consequence of the absence of prudent restraints, the community which enjoyed the highest degree of civil liberty would on that very account be in possession of the worst government. On the other hand, the definition given by Paley (which agrees with that of Blackstone, and with the common understanding of the word), declares civil liberty to be "the not being restrained by any law but what conduces in a greater degree to the public welfare." Here civil liberty is distinguished from natural liberty, that is, from the mere absence of restraint, by being considered as that portion of natural liberty which, under the supposed circumstances, ought to be sanctioned by the law, and recognised by a just society, as constituting the social rights of all its members. Civil liberty is thus made synonymous with good government. On comparing two communities together, they may be subjected to very different degrees of restraint, and nevertheless may be in the equal enjoyment of civil liberty. All that, for this purpose, is required, is that, in the two cases, the different degrees of restraint which are respectively imposed shall conduce in the same proportion to the public welfare. It is very difficult (notwithstanding the explanation by Sir David Evans in his preface to the collection of the statutes) to extract a consistent sense out of Justinian's well-known definition. Blackstone, by mistranslating *jus* into *justice*, instead of *law*, and by leaving out the word *vi*, made it the authority for the definition, which he himself gave, and of which we have just been speaking. The words are, *naturalis facultas ejus quod cuique facere libet, nisi quid vi aut jure prohibetur.* That is, according to the translation of Blackstone, civil liberty consists in doing what you like, unless you are hindered justly or unjustly. So far all is certain. The paragraph in the Institute cannot have been meant to coincide with that into which Blackstone has tortured it. Were it not for the word *vi*, it might be supposed to mean the same with Mr Austin. But it appears to us, that its authors have attempted to compress more into this celebrated definition than it could possibly hold. Hence the dilemma. One of the conflicting words must be given up; and then the species of liberty which is defined will depend upon the word which is retained. If *vis* is retained, it will be a definition of natural liberty; if *jus*, of civil. Whatever construction is given to *naturalis* (and the whole definition is put in opposition to that of slavery imposed *jure gentium*), *naturalis facultas* must be used in two senses, and not in one, before *vis* and *jus* can be equally exceptions to it. Civil liberty, in all senses in which the term has ever been mentioned, is compatible with acts of *vis*, or illegal violence. Accordingly, Montesquieu's interpretation (for it is apparently intended as such) of Justinian discards this alternative, and admits only of the exception made by the law. "La liberté est le *droit* de faire tout ce que les loix permettent" (*droit* ought to be *pouvoir* or *moyens*, sc. *facultas*). Again, "La liberté est le gouvernement dont on jouit." In the Manchester debate, Lord Plunkett defended what had taken place, on the authority of a similar construction of the passage in Justinian. According to this notion of civil liberty, on comparing two communities together, the degree of it which they respectively enjoy will not depend upon the degree in which their respective freedom of action is left absolutely unrestrained, nor upon the proportion which may be observed between private restraint and public advantage, but will turn on the single question, which of the two governments is succeeding best in the complete and faithful administration of its actual laws. Thus liberty and law become the same thing, and this without any reference to the quality of the laws.

Of these conflicting definitions, it will be readily acknowledged that the intermediate one,—that by which civil liberty and good government are synonymous,—is the only one which can be properly considered as the principal end of legislation. Sir James Mackintosh, in his *Discourse on the Law of Nature and Nations*, expresses and justifies it with his usual truth of principle, and with more than his usual precision of language. The security of which man in society has need, is, it must be remembered, twofold; security against wrong from individuals, as well as from the government itself. "The description of liberty which seems most comprehensive, is that of *security against wrong*. Liberty is, therefore, the object of all government. Men are more free under every government, even the most imperfect, than they would be if it were possible for them to exist without any government at all: they are more secure from wrong, *more undisturbed in the exercise of their natural powers, and therefore more free, even in the most obvious and grossest sense of the word*, than if they were altogether unprotected against injury from one another." Now, as all unnecessary restraint imposed by government is a wrong, and as all individual restraint is unnecessary, unless an equivalent is obtained by it for the general advantage of society, all restraints which are unaccompanied by this advantage, are so many deductions from civil liberty. But, on the other hand, a restraint, by means of which we gain more in our personal freedom from the check put upon others (not to say sometimes upon ourselves), than we lose from being ourselves restrained to the same extent, leaves a balance of free agency in our favour, and becomes a part of civil liberty properly understood.

As long as political liberty is wanting, the written letter of civil liberty may indeed exist, but it will exist comparatively spiritless and fruitless. Experience has shown that the sense of security and of independence is no less essential to the advancement of society than to the comfort of individuals. Filangieri, having treated, in his Science of Legislation, of the causes of the decay of Spanish greatness, anticipates a similar declension of the power of England. B. Constant, commenting upon the passage in question, is far from professing any very decided opinion in favour of the general superiority of English legislation, But he attributes the decay of Spain to the truer reason; to the perpetual pressure of a government, which ground down the national intelligence, and which, in order to have nothing to fear from its subjects, kept them in apathy, and paralysed their powers. B. Constant proceeds with the other side of the picture. He was writing in 1822. "For the proof of this, we have only to look at England. We shall find there commercial laws not less absurd, not less vexatious, not less unjust. We shall see in the massacres of the Catholics, especially in Ireland, and in the execrable regulations which reduce all that portion of the Irish people to the condition of Helots, a pendant to the persecution and almost to the banishment of the Moors; and yet England has remained in the first rank among the nations. The reason is, that the political institutions, the parliamentary discussions, the liberty of the press, which England has uninterruptedly enjoyed for more than a hundred years, have counterbalanced the vices of her laws and of her government. Her inhabitants have maintained their energy of character, because they have not been disinherited of their participation in the administration of public affairs. This participation, although almost imaginary, gives her citizens a feeling of importance, which keeps their moral life in action; and England, governed, with few exceptions, since the time of Sir Robert Walpole, by Machiavellian ministers, and represented by a corrupt parliament, has nevertheless retained the language, the habits, and many of the advantages of freedom."

It is an important object in the organic structure of the legislative authority, that it should be compelled as much as possible to keep in the position, and be conversant with the views of legislation only; that, having legislated, it should be, as it were, *functus officio*, and that the interpretation and execution of its laws should thenceforth be transferred to other departments of the state. In this consists one of the main advantages of a mixed or constitutional government. It not only affords the opportunity,—it almost creates a necessity,—for separating the exercise of the legislative, judicial, and executive authorities from one another. Notwithstanding the classical immortality conceded to Minos, Lycurgus, and Solon,—Mr Bentham, who could have no prejudice in favour of chambers over individuals as legislators, says, that he cannot discover in antiquity the traces of any true knowledge concerning legislation. It seems impossible that the Greeks should have had any knowledge on the subject, whether as to the organization of a legislature, or the principles of law, which should not have been communicated to the Romans. But what in this respect was the history of Rome throughout all the period concerning which the history of Rome is usually thought to be worth reading? With the genius, which the military and administrative masters of the world ultimately exhibited as its law-makers, it seems quite extraordinary that the personal application of their legislative intelligence to their own affairs should have been so long in growing. Cicero, boasting of the perfection of the Twelve Tables, and of the short time which it took to learn the Roman law, never seems to have been aware that this account of it was a symptom of its deficiencies, just as would be the case with a boasting Turkish cadi at the present day. The few lines in which the philosophical Tacitus dismisses the mass of laws which by his time had accumulated upon the practitioner and the public to an unmanageable bulk, are as severe a satire as a more laboured commentary. Professing to turn aside to the principles of Roman jurisprudence, and to the methods by which Rome had reached its infinite multitude and variety of laws, he conveys to the reader his deliberate opinion, that the Twelve Tables were the *finis æqui juris*, and that they comprehended whatever was really just and valuable in Roman law. "The laws which followed, although sometimes directed against wrong-doers, were generally passed by violence, either through the dissension of the orders, or for the sake of gaining unlawful honours, or in order to expel distinguished men, or for some other disgraceful object." This was no peculiar fancy taken up by Tacitus for the sake of throwing one of his Caravaggio-shadows over the picture. The popular Livy, too, who loved to see and to paint every thing brightly, finds equally in these ancient records the fountain of public and private law. Up to the time of Cicero, what could be the actual laws of Rome or the Roman world, when he appealed (*fremant licet*) to these Twelve Tables as the pillars of Hercules, which civil philosophy could never hope to pass? So much for the legislation of the Roman Republic, and for lamentations over what the world has lost in lessons of legal wisdom (at least up to the age of Tacitus) by the negligence or the treachery of Tribonian. What is called the age of its classical jurisprudence visited the Roman law at last. By the time of Papinian and Ulpian, the various other sources from which the laws of every country must always be more or less derived, had sent forth such abundant streams, that Tribonian and his colleagues had nothing to do but choose amongst them from what waters they should fill that imperishable reservoir at which all future generations were to come and drink. Had the Roman constitution made a juster arrangement of the three great political powers, it is improbable that so much of its laws should have had to be sought for in these indirect channels. And, in that case, it would have been impossible that the period of their being brought together and united in one majestic body should have been deferred so long. But there is another consideration, of still greater consequence to contemporary generations than even the formation of a system of jurisprudence. In that case, it would have been equally impossible, that a hundredth part of the injustice, whether legislative, judicial, or executive, with which Roman history swarms, should ever have been committed. The Romans as a nation seem to have remained for ages incapable of discerning the fundamental difference between a legislative and a judicial act. It is a distinction upon which the English constitution is founded, and is carefully described by a great master in politics. "A legislative act has no reference to any rule but these two, original justice, and discretionary application. Therefore it can give rights—rights where no rights existed before; and it can take away rights where they were before established. For the law, which binds all others, does not, and cannot, bind the law-maker; he, and he alone, is above the law. But a judge, a person exercising a judicial capacity, is neither to apply to original justice, nor to a discretionary application of it. He goes to justice and discretion only at second hand, and through the medium of some superiors. He is to work neither upon his opinion of the one nor of the other; but upon a fixed rule, of which he has not the making, but singly and solely the *application* to the case." (Burke, vol. x. p. 66.) He adds, addressing the House of Commons on the case of Mr Wilkes, in the Middlesex election: "In our legislative capacity we are in most instances esteemed a very wise body. In our judicial we have no credit, no character, at all." M. Comte, we perceive, admits the pre-eminence of England upon questions of legislation. The authority, it is true, of the English parliament as representing the public weal, has acted throughout all English history like a charm. Should it be doubted whether the legislative reputation of parliament stands at present quite so high with the English public as Burke imagines it to have stood in 1771, there can be no doubt but that its judicial reputation continues quite as low. But in this, as in other cases, a disorder is half cured when its cause is known. It was the misfortune of the Roman government, owing to the confusion in which the exercise of all authorities was mixed up together under it, that there were not always the means, in point of fact, and there was never any sound and recognised principle of law to appeal to, as a test distinguishing between them.

The study of the science of legislation is the noblest of all studies. The art of applying this science to the practical necessities of mankind is the noblest of all professions. Nothing can more tend to fill the understanding and elevate the spirit of a human being. Every legislator, to be worthy of his office, ought to have a high idea of its dignity. He should think it is his duty to learn the boundaries of the science, and to master the criteria which determine what is contained in and what excluded from it. Its legitimate province is so immense that no single intelligence can be capable of cultivating and commanding the whole of it. Different individuals will be guided by appropriate considerations, private and public, respecting the special departments they particularly select. But whether the department be easy or laborious, one or many, the spirit and the principles by which its legislation ought to be conducted will be the same. The previous knowledge of the general nature of his subject, which is for this purpose required of a statesman, is not to be picked up in a day. Members of society, one and all, stand, with regard to the body of which they are parts, in two opposite relations; and they are entitled to demand that their joint and several interests in both relations should be measured and respected. It is their right, on the one hand, that no restraint shall be imposed upon any individual, but what will contribute in a greater degree to the public welfare. It is not less their undoubted right, on the other hand, that whenever a restraint will so contribute, it shall be forthwith imposed upon all. If unnecessary restraints are so much wanton destruction of human happiness, the omission or relaxation of necessary restraints may be no less fatal. They expose to wanton injury the means of happiness, which the law ought to protect, and they compel the party injured to seek out the imperfect remedies of irregular and barbarous times, and to carve out for himself the reparation which the law refuses. To draw lines of this description justly, is the work of great observation and profound philosophy combined. What investigations does it not require on the nature of property. We need only allude to the controversy between Grotius and Selden, on the famous question of the freedom of the seas; and to the absence of all principle in the unsatisfactory regulations respecting animals, called *feræ naturæ*, in the laws as well of France as of England and America. What discrimination does it not require in marking the subtile limits by which, in the case of a hundred rights and duties, morals are separated from law. Principles and examples of this kind are to be found in abundance in the great writers upon duty and natural jurisprudence.[1] In the legislation of every country—certainly in that of England—there are many instances of some actions being made cognizable by law which more properly belong to morals; and of others being left to morals, which ought to be brought under the penalty of the law. A due examination into the boundaries of morals and law can scarcely fail to inspire becoming caution wherever there is a chance of opposite laws being brought into collision with each other. Occasions may easily be conceived when a man will be called upon to perform an action which shall place him within the concentric circles of the several jurisdictions of the divine law, the law of morals, the law of honour, the law of nations, and the law of the land. If these several laws, acting with their respective sanctions, concur in the line of duty which they require of him, all is well. Wo to him if they should pull in opposite directions. A government is answerable for the lives and consciences of men, whenever, without an absolute necessity, it drives its subjects to this terrible alternative.

The following passage is taken from Burke's tract on the Irish popery laws. No argument that human wisdom can devise would prove more forcibly the wickedness of legislating against the law of morals,—that is, against the paramount principles of human nature,—than that a political reasoner like Burke should have been so maddened by the contradiction, as to find there the legal evidence by which municipal laws are annulled, instead of the moral authority by which they are resisted. "The true weakness and opprobrium of our best general constitutions is, that they cannot provide beneficially for every particular case, and thus fill, adequately to their intentions, the circle of universal justice. But where the principle is faulty, the erroneous part of the law is the beneficial, and justice only finds refuge in those holes and corners which had escaped the sagacity and inquisition of the legislator. The happiness or misery of multitudes can never be a thing indifferent. A law against the majority of the people is in substance a law against the people itself: its extent determines its invalidity; it even changes its character as it enlarges its operation; it is not particular injustice, but general oppression; and can no longer be considered as a private hardship, which might be borne, but spreads and grows up into the unfortunate importance of a national calamity. Now, as a law directed against the mass of the nation has not the nature of a reasonable institution, so neither has it the authority; for in all forms of government the people is the true legislator; and whether the immediate and instrumental cause of the law be a single person or many, the remote and efficient cause is the consent of the people, either actual or implied; and such consent is absolutely necessary to its validity. To the solid establishment of every law two things are essentially requisite; first, a proper and sufficient human power to declare and modify the matter of the law; and, next, such a fit and equitable constitution as they have a right to declare and render binding. With regard to the first requisite, the human authority, it is their judgment they give up, not their right. The people, indeed, are presumed to consent to whatever the legislature ordains for their benefit; and they are to acquiesce in it, though they do not clearly see into the propriety of the means by which they are conducted to that desirable end. This they owe as an act of homage and just deference to a reason which the necessity of government has made superior to their own. But though the means, and indeed the nature, of a public advantage, may not always be evident to the understanding of the subject, no one is so gross and stupid as not to distinguish between a benefit and an injury. No one can imagine, then, that an exclusion of a great body of men, not from favours, privileges, and trusts, but from the common advantages of society, can ever be a thing intended for their good, or can ever be ratified by any implied consent of theirs. If, therefore, at least an implied human consent is necessary to the existence of a law, such a constitution cannot in propriety be a law at all. But if we could suppose that such a ratification was made, not virtually, but actually, by the people, not representatively, but even collectively, *still it would be null and void.* They have no right to make a law prejudicial to the whole community, even though the delinquents, in making such an act, should be themselves the chief sufferers by it; because it *would be made against the principle of a superior law*, which it is not in the power of any community, or of the whole race of man, to alter,—I mean the will of Him who gave us our nature, and, in giving, impressed an invariable law upon it. It would be hard to point out any error more truly subversive of all the order and beauty, of all the peace and happiness, of human society, than the position that any body of men have a right to make what laws they please; or that *laws can derive any authority from their institution merely, and independent of the quality of the subject-matter.* No arguments of policy, reason of state, or preservation of the constitution, can be pleaded in favour of such a practice. They may indeed impeach the frame of that constitution, but can never touch this immoveable principle. This seems to be indeed the doctrine which Hobbes broached in the last century, and which was then so frequently and so ably refuted. Cicero exclaims with the utmost indignation and contempt against such a notion (*de Legibus*, lib. i. 15, 16); he considers it not only as unworthy of a philosopher, but of an illiterate peasant; that of all things this was the most truly absurd to fancy, that the rule of justice was to be taken from the constitutions of commonwealths, or that laws derived their authority from the statutes of the people, the edicts of princes, or the decrees of judges. If it be admitted that it is not the black letter and the king's arms that make the law, we are to look for it elsewhere. In reality, there are two, and only two, foundations of law; and they are *both of them conditions, without which nothing can give it any force;* I mean *equity* and *utility.* With respect to the former, it grows out of the great rule of equality, which is grounded upon our common nature, and which Philo, with equal propriety and beauty, calls the mother of justice. All human laws are, properly speaking, only declaratory; they may alter the mode and application, but have no power whatever over the substance, of original justice. The other foundation of law, which is utility, must be understood, not of partial or limited, but of general and public utility, connected in the same matter with, and derived directly from, our rational nature; for any other utility may be the utility of a robber, but cannot be that of a citizen; the interest of the domestic enemy, and not that of a member of the commonwealth. This present equality can never be the foundation of statutes, which create an artificial difference between men, as the laws before us do, in order to induce a consequential inequality in the distribution of justice. Law is a mode of human action respecting society, and must be governed by the same rules of equity which govern every private action; and so Tully considers it, in his Offices, as the only utility agreeable to that nature. *Unum debet esse omnibus prepositum, ut eadem sit utilitas uniuscujusque, et universorum; quam si ad se quisque rapiat dissolvetur omnis humana consortio.*" It is no wonder that this kind of conflict between opposite laws of distinct authority which outraged Burke, should have also misled Blackstone. Locke, *On the Extent of the Legislative Power*, equally denies the moral right to legalize injustice; and Hooker the same; but Locke afterwards (vol. ii. p. 250), in his letter on toleration, shows that he is aware that the rectification of a similar abuse of power is to be sought for in the field of battle, not in a court of justice. "What if the magistrate believe that he has a right to make such laws, and that they are for the public good, and his subjects believe the contrary? Who shall be judge between them? I answer, God alone. There are two sorts of contests among men, the one managed by law, the other by force; and these are of that nature, that, where the one ends, the other always begins."

---

[1] Bishop Sanderson's *Sermons*, 274; Jeremy Taylor, vol. i. 241; *On Obligation and Relaxation of Human Laws*, vol. xiii. 230; *Traité de Legislation*, vol. i. 93.

But there is as little excuse for some of the contradictions which subsist between the positive laws of different nations. Most of them might be removed by a judicious comparative legislation. In this point of view, it is highly desirable that the independent states, which constitute the great commonwealth of the civilized world, should make a rational *concordance* of those chapters of their municipal laws, in which the subjects of all must, from their intercourse with each other, have a common interest. Mr Justice Story has done much towards opening the way both to the end and to the means, in his *Commentaries on the Conflict of Laws in regard to Contracts, Rights, and Remedies, and especially in regard to Marriages, Divorces, Wills, Successions, and Judgments.* The state of things by which a couple are married or unmarried, according as they may happen to be in France, Scotland, or England, is hardly less monstrous than the contradictory title which, on the doctrine of a double allegiance, England and America, for instance, may set up to the obedience of the very same individual,—each being ready to enforce its legal title by the extreme sanction of the law. England is likely to have the honour of leading the way on one subject. Mr Justice Story elsewhere observes on the predominance which the system of commercial law, as established in England, is obtaining over the world; and anticipates that Europe has nearly arrived at the point when the same commercial principles will form part of the public law of all its sovereignties. If, in the last generation, Lord Mansfield acquired this honour for his country and for himself, whilst dealing with and conciliating the gracious interests growing up from out of the civilizing intercourse of peace, Lord Stowell has in our own time derived an equal glory from out of the calamities and injuries of war. Foreigners, looking on upon the just and liberal jurisprudence administered in his prize-courts, have thought it not too much to call him the ornament, not of his "own age or country only, but of all ages and all countries; the intrepid supporter equally of neutral and belligerent rights; the pure and spotless magistrate of nations."

The mischief arising from intemperate and ignorant enactments makes it of great importance to fix accurately, in every case, the true limits of prudent legislation. Thus, the sphere of mischief is railed in; and thus also a legislator may more easily learn the extent of the knowledge which he has to acquire, and of the responsibility which he incurs. From the mode in which Burke's political maxims are scattered about in the different parts of his voluminous writings, as the occasion happened to call them forth, the greater and more philosophical portion of them are not so stedfastly recollected by the public as must have been the case if they had been incorporated and presented in a more systematic form. Having occasion to restate the principles expressed by Burke, it would, however, be great injustice to the reader to express them in other words. "It is," says he, "one of the finest problems in legislation, and what has often engaged my thoughts whilst I followed that profession, 'what the state ought to take upon itself to direct by the public wisdom, and what it ought to leave, with as little interference as possible, to individual discretion.' Nothing, certainly, can be laid down on the subject that will not admit of exceptions, many permanent, some occasional. But the clearest line of distinction which I could draw, whilst I had my chalk to draw any line, was this,—that the state ought to confine itself to what regards the state, or the creatures of the state, namely, the exterior establishment of its religion; its magistracy; its revenue; its military force by sea and land; the corporations that owe their existence to its fiat; in a word, to every thing that is *truly and properly* public; to the public peace, to the public safety, to the public order, to the public prosperity. In its preventive police it ought to be sparing of its effects, and to employ means, rather few, unfrequent, and strong, than many and frequent, and of course (as they multiply their puny politic race, and dwindle) small and feeble. Statesmen who know themselves will, with the dignity which belongs to wisdom, proceed only in this, the superior orb and first mover of their duty, steadily, vigilantly, severely, courageously; whatever remains will, in a manner, provide for itself. But as they descend from a state to a province, from a province to a parish, and from a parish to a private house, they go on, accelerated in their fall. *They cannot do the lower duty; and in proportion as they try it, they will certainly fail in the higher.* They ought to know the different departments of things; what belongs to laws, and what manners alone can regulate. To these, great politicians may give a leaning, but they cannot give a law. Our legislature has fallen into this fault, as well as other governments; all have fallen into it more or less."

A great deal is here excluded. Much of what the Puritans legislated for instantly on their arrival in New England; much of that on which the imperial parliament of Great Britain is often unwisely called upon to legislate at present; for example, amongst other things, for the better observation of the Sabbath. Quite enough, however, is left for the most industrious and intrepid statesman. The discussion of the questions which Burke reckons truly legislative, instead of being disposed of in the few paragraphs of a summary, would occupy each a volume by itself. Besides, whatever may be the precise subject on which a legislator may be engaged, he should always remember that there is that sympathy and connection between the several parts, even of the most irregular system, that he can never be safe in dealing with any specialty or fragment of it unless he knows something also of the rest, or knows at least the general bearings of the divisions which adjoin.

In a view of legislation, however cursory, it would be unpardonable to omit the outline sketched by the masterly hand of one who was certainly the greatest and the wisest (and we believe very far from the meanest) of mankind. What a treasure for all ages, had but the outline been filled up by his weighty sentences, and with his capacious views. "For the more public part of government, which is laws, I think good to note only one deficience: which is, that all those which have written of laws, have written either as philosophers or as lawyers, and none as statesmen. As for the philosophers, they make imaginary laws for imaginary commonwealths, and their discourses are as the stars which give little light, because they are so high. For the lawyers, they write according to the states where they live, what is received law, and not what ought to be law; for the wisdom of a law-maker is one, and of a lawyer is another. For there are in nature certain fountains of justice, whence all civil laws are derived but as streams; and like as waters do take tinctures and tastes from the soils through which they run, so do civil laws vary according to the regions and governments where they are planted, though they proceed from the same fountains. Again, the wisdom of a law-maker consisteth not only in a platform of justice, but in the application thereof, taking into consideration by what means laws may be made certain, and what are the causes and remedies of the doubtfulness and uncertainty of law; by what means laws may be made apt and easy to be executed, and what are the impediments and remedies in the execution of laws; what influence laws touching private right of *meum* and *tuum* have into the public state, and how they are to be made apt and agreeable; how laws are to be penned and delivered, whether in texts or in acts, brief or large, with preambles or without; how they are to be pruned and reformed from time to time, and what is the best means to keep them from being too vast in volumes, or too full of multiplicity and crossness; how they are to be expounded, when upon causes emergent, and judicially discussed; and when upon responses and conferences touching general points or questions, how they are to be pressed, rigorously or tenderly; how they are to be mitigated by equity and good conscience; and whether discretion and strict law is to be mingled in the same courts, or kept apart in several courts. Again, how the practice, profession, and erudition of law is to be censured and governed, and many other points touching the administration and (as I may term it) animation of laws."[1]

We have no very great respect for what are called fundamental laws. We do not share in the want of confidence which they imply in the wisdom and virtue of posterity; which wisdom and virtue, when once wanting, a mere paper constitution can do nothing to supply. They are, we are convinced, far more likely in most cases to retard the progress of a country for the future, than to secure in perpetuity, or for a day, the possession of those advantages which have already been obtained. At the same time there are a few leading principles in politics pretty well settled. And if bills of rights, charters, and constitutions, confined themselves to these, as much good perhaps as harm might accompany the declaration of them. But the particularity to which the constitutions of some of the American states have descended is ridiculous now, and may be mischievous hereafter. For this it is sufficient to refer to the commentaries of Chancellor Kent. Few countries have sought to tie up the body of their civil and criminal laws in leading-strings of this description. Laws of this class (except in rare instances of occasional presumption) are respected as great problems, on which mankind may as yet have much to learn, and which therefore had best be left open for whatever improvements time and discussion may suggest. With regard to them, therefore, we will premise a few very general directions. They may well claim to be approached in the spirit both of a philosopher and an historian.

---

[1] *The Advancement of Learning.*

1. On approaching the subject, a reflecting person must perceive the necessity of laying out before him, in the first instance, as it were upon a map, the leading principles of general jurisprudence. What these are can only be learned from a patient analysis of human nature. Here Romagnosi and Comte call on him to observe the powerful tendencies of mankind, of which the law ought to be the express image. Here Bentham points out the anti-social passions which it is one of the first offices of the law to thwart and to subdue. Here come in Destutt de Tracy's admissions, the more important in proportion as they appear reluctant and extorted, on the necessity of watching and picking out our way amongst the contradictions and infirmities of our imperfect nature. If it be true that the laws of nature exist anterior and superior to ours,—that what is fundamentally just is that which is in conformity with them, what is radically unjust is that which is opposed to them; and therefore that our laws, inasmuch as they are weaker and subsequent, should, in order to be good, be in harmony with these natural laws of greater antiquity and strength,—it is no less true, that the immediate feelings and opinions of considerable bodies of men often represent so ill the interests of the actual generation (those of the next often not at all), that the real interests, even of the parties themselves, much more those of mankind, including the generations that come after, will be best promoted by their immediate feelings and opinions receiving a peremptory contradiction from the law. All that is wanted in any case, in justification of thus much of contradiction, is to suppose that the restraints are wisely placed, and that the members of the community in question, at least that part of them which is not incorrigible, are capable, like those of a well-regulated family, of accommodating their wills to the restraints. Destutt de Tracy agrees with Montesquieu, when Montesquieu is treating of the disadvantages of certain climates, in considering "that bad legislators are those who favour the vices of the climate; good, those who are opposed to them." The maxim is equally true of all evil tendencies, however generated. And the problem to be solved is in every case the same; the cost of the opposition, and the probability of success. On the one hand, you must not expect too much, and enter upon a vain contest. On the other, you must not put up with miseries and scandals that a little vigour would remove. Connected with this part of the subject, or rather practical parts of it of the greatest nicety, are the two important questions; first, at what point in any given instance the predominance of personal or local peculiarities is so great as to overbalance the considerations upon which the general principle had been constructed; and, next, what are the cases where observation and reason can only show that it is necessary there should be *some* rule, but are not able clearly to discover *what* the rule should be. If man could be kept right in his body natural or politic by a few universal principles, the sciences of medicine and of legislation would be comparatively easy. But there is no limit to the modifications which the use of the most approved specifics may require; and the best statesmen are quite as well aware as the best physicians, that a knowledge of the constitutions of their patients is no less necessary than a knowledge of the theory of their respective arts. Before simplicity and uniformity can be merits, there must be simplicity and uniformity in the subject to which they relate. Now these are not among the characteristics of man. Accordingly, Bacon has directed the attention of lawgivers towards the particular exceptions to general jurisprudence which differences in regions and governments must always be introducing into the different systems of practical law. The conquerors of the East, whether ancient Greeks or modern Britons, have felt the obligation of respecting usages so originating. Mr Bentham feels this so strongly that, in indulgence to immemorial custom, he questions, for instance, our laws against infanticide in Cutch. Nothing is more to the credit of the discretion of our Indian government than the gradual measures by which they proceeded against suttees; measures, where every symptom and circumstance required to be watched as the experiment was going on, in order to ensure its success. A great portion of the rules of property are expedients in solution of the other dilemma. On the one hand, property exists everywhere; property, by law established. To ask, therefore, whether there should be such a thing as private property, is, in other words, to ask whether there should be such a thing as society. And if utility requires property as an institution, it equally requires that the conditions of it should be fixed by the only authority capable of fixing it,—the municipal law of the country where the question arises. On the other hand, an enumeration of the countless diversity of these conditions in different countries would cover pages. Some of them certainly might be drawn nearer to each other by the line of reason. But many are purely arbitrary, and must always remain so. Hume, towards the conclusion of his appendix on *Farther Considerations with regard to Justice*, explains (in a passage which Paley has enlarged) the slight analogies to which, in cases of this description, legislation must resort. "When natural reason points out no fixed view of public utility by which a controversy of property can be decided, positive laws are often framed to supply its place, and direct the procedure of all courts of judicature. Where these two fail, as often happens, precedents are called for; and a former decision, though given itself without any sufficient reason, justly becomes a sufficient reason for a new decision. If direct laws and precedents be wanting, imperfect and indirect ones are brought in aid; and the controverted case is ranged under them, by analogical reasonings and comparisons, and similitudes and correspondences, which are often more fanciful than real. In general it may safely be affirmed, that jurisprudence is, in this respect, different from all the sciences; and that in many of its nicer questions, there cannot properly be said to be truth or falsehood on either side. If one pleader brings the case under any former law or precedent, by a refined analogy or comparison, the opposite pleader is not at a loss to find an opposite analogy or comparison. And the *preference given by the judge is often founded more on taste and imagination than on any solid argument.* Public utility is the general object of all courts of judicature; and this utility, too, requires a stable rule in all controversies. But where several rules, nearly equal and indifferent, present themselves, it is a very slight turn of thought which fixes the decision in favour of either party." If the well-known distinction between legislation and that part of the administration of justice the results of which we are learning to call jurisprudence had been present to the mind of the philosopher whilst he was writing the above paragraph, he would have perceived that he was de-

scribing the course of the first, and not the second. Courts of justice may be driven to such resources by a necessity more or less imperative. Whenever they are so, the difference in this respect between their course in adjudicating upon questions which arise under the common law and those which arise upon the statute law is, at the most, only a difference in degree; and, in the two cases, their comparative authority was originally construed quite the reverse from what is usually understood at present. Nevertheless, in truth, the court must be always discharging, on these occasions, the office of a legislator, not a judge. In another part of his works, Hume notices the very delicate question, What are the degrees of relationship within which marriage ought not to be contracted? This is another of those cases in which philosophical jurisprudence can do no more than intimate the principle. "Love between the nearer relations is contrary to reason and public utility; but the precise point where we are to stop can scarcely be determined by natural reason, and is therefore a very proper subject for municipal law or custom. If the Athenians went a little too far on the one side, the canon law has surely pushed matters a great way into the other extreme." On taking leave of the preliminary inquiry into general jurisprudence, it is no exaggeration to say that Mr Bentham was the first jurisconsult who ever applied, with any thing like adequate detail, a searching analysis of human nature to the elements of law. His catalogues of the pains and pleasures of which man is susceptible, have acted like a blister to the former plausible and superficial systems. With an analysis of this sort on their tables, an end has been put to those more ancient and contradictory catalogues of the laws of nature which bookish scholars so long invented at their pleasure. Had it existed earlier, we should not have had, for instance, Domat and Montesquieu at issue on the very principle of filial inheritance; Domat declaring that it is a law of nature that children should succeed to the property of their parents; Montesquieu, on the other hand, declaring that it is a law of nature that a parent should exercise his discretion.

2. After having settled his map of general jurisprudence on the common principles of human nature, a wise legislator will proceed to examine the legislation of the particular country for which he is about to legislate. This must lead him on every subject to a complete and correct view of the progress and actual condition of its law. Mr Bentham, in his *Theory of Legislation*, has treated history too much like an old Almanac. It is indeed the standard defect of his writings, that he seldom looks for help from any other understanding except his own. The sages of the English law, however, have every reason to be content with the value which he teaches the legal reformers of England to put upon their collected labours. "Traverse," he observes, "the whole Continent of Europe; ransack all the libraries belonging to the jurisprudential system of the various political states; add the contents of all together, and you would not be able to compose a collection of cases equal in variety, in amplitude, in clearness of statement, in a word, in all points taken together, in instructiveness, to that which may be seen to be afforded by the collection of *English Reports of adjudged Cases*, on adding to them the *Abridgments and Treatises*, by which a sort of order, such as it is, has been given to their contents." (*Papers Relative to Codification*, 1817.)

3. The legislator ought in the next place to compare, on all points of importance, different systems of jurisprudence with each other. The necessity of this extended information on the part of the English legislature arises from even a higher duty than that of enlarging the sphere of philosophical induction. It is a direct necessity imposed on its members, by the fact that there is scarcely a species of law existing on the face of the earth which is not within the province of their immediate superintendence. "At this moment there are few of the systems of legislation, either of ancient or modern times, which are not in force as living law within the British empire. Menu and Mahommed decide the civil rights of the Hindu and the Mogul; and an appeal from India compels our privy councillors to consult the Koran and the Puranas as authorities at Whitehall. Justinian is obeyed by the courts of the Ionian republic. In the Norman isles, the severed portions of the domains of the conqueror, the barbaric custumal framed by his justiciars still guides the grand bailiff and the seneschal, who dispense the equity of Rollo, now forgotten in the hall of Rouen. Canada cherishes the volumes which have been cast forth from the palace of justice; and the legitimate representatives of the proud and learned presidents of the parliament of Paris, are found in the court-house of a colonial town. Banished from the flowery meadows of the Seine, the ordinances expounded by Saint Louis beneath the oak-tree at Vincennes constitute the tenures of lands on the Gulf of St Lawrence; and, whilst every vestige of feudality has been blotted out of the title-deeds of the European continent, it remains in full vigour in the wilds and wastes of the New World. In the opposite hemisphere, we bestow an equal protection on the codes of Napoleon; and it is possible that, in future ages, the speck of land, the Mauritius, in which they are now in force, may alone preserve the vestiges of the jurisprudence of the Great Empire. Our sovereign appoints his alcades and his corregidors in the Indies of Columbus; whilst his landrosts in Southern Africa are guided by the placets of the states-general of the departed republic of the Netherlands. The laws of king Christian of Denmark are administered by British authority in the torrid zone. And the deemsters assembled on the Tynwald of Man have not abandoned the polity of the sea-kings of Scandinavia. It is difficult to question the policy which first induced England to soothe her stranger subjects, by thus indulging them with the exercise of the laws which habit had rendered dear to them. But our legislators should now begin, slowly and cautiously, to assimilate the institutions of the dependencies to those of the mother country."[1]

4. *Lastly*, a legislator should be qualified, as far as possible, to refer the variations of different systems to their true causes, whether of climate, geographical peculiarities, state of civilization, political events, particular institutions, or of any other description.

There is no difference of opinion as to the reality of most of the variations just mentioned, or their causes. Those which it is the most important to dwell upon, because, being the most insensible, they run the greatest risk of being overlooked or underrated, are the changes by which, in the course of generations, the moral and intellectual identity of almost every nation is necessarily destroyed. In this manner the gradual amendment of the laws of a country should be the best part of the history of its progressive civilization. It ought to be consequent upon it, and to be the surest sign of it. Strangely opposite theories upon the transitiveness or stationariness of laws have been put forward in the discussions on codification. The fact, thus asserted on one side and denied on the other, seems to be regarded by some of the disputants as decisive of that particular controversy. This we conceive to be a most imprudent, and, what is more to the purpose, a most erroneous admission upon the part of the advocates of a code. The extent to which the fact of a gradual, and thus at last an almost total, change in the moral and intellectual identity of a people, affects the value of a code, is a matter only of degree. The fact, if true, will certainly prevent a code from being framed, once and for ever. But it by no means follows that a code may not after all be a desirable compromise in the alternative of difficulties which the question of code or no code necessarily presents. It will only follow that it must be put up in moveable types, not in stereotype. If our extract from Savigny should be thought an exaggerated statement of the necessarily flexible and fluent character of nations, and of their laws, this statement is, in our opinion, much nearer the truth than any notion of immutability, even than that of an immutability liable to be broken in upon only by great occasions, such as Meyer apparently insinuates rather than positively affirms. "In the earliest times to which authentic history extends, the law will be found," says Savigny, "to have already attained a fixed character, peculiar to the people, like their language, manners, and constitution. Nay, these phenomena have no separate existence; they are but the particular faculties and tendencies of an individual people, inseparably united in nature, and only wearing the semblance of distinct attributes to our view. That which binds them into one whole is the common conviction of the people, the kindred consciousness of an inward necessity, excluding all notion of an accidental and arbitrary origin. But these moral faculties require some bodily existence to fix them. Such, for language, is its constant uninterrupted use,—such, for the constitution, are palpable and public powers; but what supplies its place with regard to the law? In our times it is supplied by rules communicated by writing and word of mouth. This mode of fixation, however, presupposes a high degree of abstraction, and is therefore not practicable in early times. On the contrary, we then find symbolical acts universally employed where rights and duties were to be created or extinguished. These formal acts may be considered as the true grammar of law in this period. But this organic connection of law with the being and the character of the people, is also manifested in the progress of the times; and here again it may be compared with language. For law, as for language, there is no moment of absolute cessation; it is subject to the same movement and development as every other popular tendency; and this very development remains under the same law of inward necessity, as in its earliest stages. Law grows with the growth and strengthens with the strength of the people, and finally dies away as the nation loses its nationality. The sum, therefore, of this theory is, that all law is originally formed in the manner in which, in ordinary but not quite correct language, customary law is said to have been formed; that is, it is first developed by custom and popular faith, next by jurisprudence; everywhere therefore by internal, silently operating powers, not by the arbitrary will of a lawgiver."[1] Meyer, on the other hand, from the way in which he expresses himself, gives his readers to understand, that the elements of internal change in the habits of a people, to the degree even in which they influence its customary law, are nothing more than occasional exceptions. "Supposing," says he, "all law to be introduced by usage, it would ensue that it was susceptible of variation when the difference of circumstances in which a nation finds itself, introduces a notable change in its necessities, that is, in its manner of existence. But there is no reason to conclude that a change of this kind is the necessary and immediate consequence of the ordinary alterations naturally resulting from the lapse of time. According to our manner of considering the subject, law, whether it is regarded as an emanation of human wisdom applied to given facts, or is looked upon as the result of the necessary combinations which a state of society introduces, must be unalterable, unless by *reason of some important event*, sufficient either to displace the facts to which the theory has been applied, or to destroy the usage. Custom is unalterable, or it would not be custom; resting on a series of similar facts, it excludes all idea of variation and constant flux. Beginning from the point at which uncertainty ceases, whatever remains stable (notwithstanding slight variations in the species which present themselves) is alone that which can be considered to constitute usage; just as the height of water is calculated by the line which it constantly draws, though one wave may rise above, and another may fall below. The main notion of a law always in movement, always in a course of improvement, and adapting itself to the demands of the moment, and which consequently can never be stationary or regarded from a settled point, is one of those vague conceptions which can only arise in minds pre-occupied by fallacious systems. Law, even customary law, is by its nature invariable and fixed, though capable of being changed when circumstances imperatively require it. But these changes, so far from being of the essence of law and custom, are, on the contrary, altogether exceptions; and it is impossible to have a precise idea of floating laws."[2] This is very unguarded language, quite unworthy of the author of the *Institutions Judiciaires*, and of the good sense and learning which characterize the work in which it appears. Of course, every effect, in the case of laws, as of other things, must have its cause, and that a sufficient one, although not always equally assignable; or it would not have taken place. As far, therefore, as man is unchangeable, such laws as have been once put in harmony with his nature, may be expected to be also unchangeable. But even the class of laws properly belonging to human nature is affected by many causes which produce little or no change in the visible wants and aspect of society; whilst the numerous other laws which follow the bidding of a government, or the temporary tendencies of juridical learning, must change as they change, and often from causes slight enough.

---

[1] *Edinburgh Review*, vol. xxxvi. p. 288, *Courts of Ancient English Common Law*, attributed to Sir F. Palgrave.

Foreign jurists, when most favourably disposed to English law, are nevertheless marvellously struck by the poverty and narrowness of most English law-books. Few of our legal writers have thought of any thing further than of compiling and classifying books of practice. Practising lawyers, for the most part, therefore, it may be taken for granted, will consider as quite superfluous almost all and every portion of the labour which we have above required of the makers of the law. Partisans of the historical school in Germany and elsewhere will take their own share of antiquarian doctrine, but be disposed to pay too little attention to the general philosophy of human nature. On the other hand, many of the strict followers of Mr Bentham, too confident in the expanded views opened to them by their master, will think it beneath them to descend from their mountain top, and shut themselves up, as it were, within the paltry bounds of one or two private schools. Now, the several classes thus enumerated are disqualified for the task of legislation, just in the proportion that they are exclusive. Their favourite views are all highly valuable, and the more so because they are to a considerable degree independent of each other. The greater part of all positive systems of jurisprudence were originally built up by means of customs, incidental text-books, and the decisions of courts of justice upon particular cases. After being thus constructed, they were subsequently taught synthetically only as sciences, without having the aid and correction of any real analysis applied to them. Little, therefore, having been ever derived directly from this source, we believe that, in making or amending laws, a philosophical analysis of human nature is of such paramount importance, that without it nothing new and really great will ever be introduced. In this manner alone can a statesman hope to learn what is the standard to which every reform in legislation, except as controlled by special circumstances, should be directed; and by these means alone can he learn how this standard is to be approached. On the other hand, comparative law is a science as well worth studying, and, *mutatis mutandis*, ought to be studied for the same purpose, as comparative anatomy. Religion is the only other subject which has occupied half the same amount of understanding. Besides, no human genius is competent to think out unassistedly a system of law. The legislative and judicial records of mankind are amongst the very highest subsidiary authority for discovering the true principles of human nature upon the questions to which they relate. But, independently of this consideration, the immediate influence exercised by their laws and institutions upon a people, and the way in which all laws and institutions of any standing lean upon and penetrate each other, are practical points of the greatest nicety and weight. An accurate knowledge of them, both of their past history and present condition, in relation to the particular country to which the new legislation is to be adapted, is at least as indispensable as any illumination which the most consummate generalizations of universal jurisprudence can afford. Fortunately, the two methods may be combined. Otherwise, on the supposition that law reforms were to be intrusted to a single jurist, and that accordingly we were obliged to choose our legislator, pure and unadulterated, out of one or other of these opposite schools, we should think ourselves safer among the precedents of the legal antiquarian, than among the speculations of the juridical metaphysician. The precedents have been a part of the real business of life at one time. That is certain. Whether the particular speculations ever will become so, may be a very doubtful matter.

---

[1] Savigny *on the Vocation of our Age for Legislation and Jurisprudence.*

[2] *De la Codification en général, et de celle de l'Angleterre en particulier.*

A union of theory and practice can alone secure tolerable legislation. Whether the above schools act herein separately or conjointly, the work, if it is to approximate to the form of reasonable laws, must be the work of a well-practised theorist. The observations of Carmignani upon the mode in which a legislator ought to proceed in getting at his general and subordinate principles, if true of criminal law, must be true with respect to law of all kinds. In the working them out, however, it is clear that the great (perhaps the greater) part of the rules of jurisprudence will have been anticipated and ascertained in what is here supposed the earlier process of investigating the principles of legislation. "If every notion belonging to criminal laws proceeds, as it ought to proceed, from an examination of the qualities of the object out of which it arises, verifying them by observation and experience (and this is the main difficulty), what, it may be asked, is the nature of the principle which such an examination will establish? It will be the most general rule that the human mind can conceive for providing for the wants of that particular object. Will the principle be theoretical or practical? It will be both one and the other: practical because it proceeds from the experience of facts; theoretical because the result of this experience is here converted into a general rule. What, then, shall this principle be called? *A principle of criminal legislation.* But how shall this principle be made to descend from the elevated generalization in which it consists, and be so applied as, in every possible case, to provide for the wants of the object out of which it has first arisen? By observing how best to apply it to the several cases, by considering whether it embraces them all, and how it embraces them, and by fixing the nature and number of subaltern principles which are wanted for facilitating and securing this application. Now, what will be these subaltern principles? theoretical or practical? They will be theoretical, in as much as they are, as it were, a filiation from the first general principle: they will be practical, inasmuch as they are intended to provide for practical cases. How then shall these principles be called? *Rules of criminal jurisprudence.* In criminal matters, therefore, there is not one part theoretical, another practical. There is the science of legislation, or that of establishing criminal law; and there is *jurisprudence*, or the science of the application of the criminal law which has been thus established. Nor can these two branches of knowledge be properly disjoined, the first being a filiation from the second; nor can a proper value be put on this filiation, but by means of analysis."

Whatever mode of legislation is adopted, in case law is ever to be a rational science, it can only be made so by the application of powers and processes, both of observation and generalization, similar to those by which other intelligible sciences have been made. There can be no "high *priori* road;" no assumption, without evidence, of certain general principles or maxims, from and by means of which all doctrines are to be afterwards synthetically propounded. By a philosophical abstraction, what is common in *individual* cases, must be separated and classed, in order to form the *species;* and then the same must be done with what is common to the *species*, in order to form the *genus*. A marked advancement has taken place in legislation at certain periods. But the greater part of this has in all periods been directly owing to an improved analysis of some of the principal facts which enter into legal constitutions, and by a better exposition and understanding of their causes and effects. In this manner alone can the advantages and disadvantages of existing laws be faithfully ascertained. It is thus, to mention two or three instances only, that the legal maxims of former times on heresy and witchcraft, on secret tribunals, torture, extreme or barbarous punishments, have been, one after the other, successively exploded. It has been truly said that "Beccaria would not have produced a revolution in criminal legislation, if, instead of exposing the consequences of sundry mischievous laws, he had restricted himself to an eloquent development of his principles on the *right to punish;* and that the discussions which during the last century arose out of certain celebrated trials, contributed more to the progress of legal science than the *social contract of* Rousseau." Nor is this method the only one really and permanently available for the getting rid of bad laws. It is equally necessary for the framing of good ones. In no other manner can a proper use be made of the materials of existing laws, with a view to the construction of an improved system. This latter enterprise certainly requires a combination of great qualities and attainments. In order to duly correct the English system, for instance, what different capacities must be put in requisition for the task. There will be wanted the learning of Serjeant Hill to collect the materials of a purely professional kind (the most important materials after all),—the philosophical genius of Lord Mansfield to deduce from them liberal and comprehensive rules,—the logic and the caution of Lord Eldon to trace the consequences of the rules to their remotest fibres, and to fix, in one of his exact parentheses, the limits and the exceptions by which particular rules ought to be guarded. The difficulties to be overcome in legislation are great, but not altogether insuperable. It is no answer to a proposition for a thorough sifting into the state of the laws of any country, that any extensive improvement of laws is a difficult undertaking. It is an equally insufficient objection to say, that the best possible system of legislation must, after all, be to a certain degree imperfect. The English nation has inherited a system of laws founded on the force of habit, the authority of prescription, the learning of text writers, and the discretion of judges. Its government must (supposing it to be otherwise competent to the performance of the high trust with which it is invested) be capable of determining whether it has, in point of fact, sufficient means at its command for the introduction of a better system, either in substance, by a substitution, in certain cases, of more reasonable principles; or in form, by the aid either of a general consolidation, or of special codes.

A careful perusal of an excellent chapter by Dugald Stewart, in the first volume of his *Philosophy of the Human Mind*, on "the use and abuse of general principles in politics," ought to satisfy a statesman, that any pains which he may take in this investigation are not likely to be thrown away, at the period which society has at present reached. Reading it, he will the better understand by what causes the science of legislation has hitherto been principally retarded, by what means its successful cultivation may be most effectually promoted, and on what grounds and to what extent we may reasonably hope that the future will consist of something better than a patchwork repetition of the past. The simplifying of legislation means something more than weeding the trash out of a lawyer's library. A single paragraph (we shall give no more from a book which everybody ought to be presumed to know) will serve to show the spirit of his opinions: "In order to lay a solid foundation for the science of politics, the first step ought to be, to ascertain that form of society which is perfectly agreeable to nature and to justice, and what are the principles of legislation necessary for maintaining it. Nor is the inquiry so difficult as might at first be apprehended; for it might be easily shown, that the greater part of the political disorders which exist among mankind, do not arise from a want of foresight in politicians, which has rendered their laws too general, but from their having trusted too little to the operation of those simple institutions which nature and justice recommend; and, of consequence, that, as society advances to its perfection, the number of laws may be expected to diminish, instead of increasing, and the science of legislation to be gradually simplified."

Codification. Codification is one of the many polysyllabic terms which Mr Bentham constructed in order to express in single sonorous words the growing wants of legal science. M. Dumont made it French, and by so doing has made it European. It signifies either the science or the operation of making codes. Modern usage has disregarded the technical nomenclature of the Roman law, wherein the code represented the compilation of that particular portion which was derived from the imperial constitutions. Most persons understand by the word at present no more than an authoritative consolidation, either of the entire body of national law, or of some particular division of it; and this, without distinguishing between the materials used or the form adopted. Five codes on law and procedure, collected from various sources, and arranged systematically in separate paragraphs, constitute the Code Napoleon. In case it is attempted to reduce the English laws to something of a system, the common law and the statute law may be incorporated or kept distinct;—the form may be that of enumerated articles, or of a continuous digest,—the digest may be framed upon either the historical or scientific principle; and yet, in these several cases, the enacted volume would be called, and with equal propriety, a code. Each of these courses has found able advocates. But there is a previous question to determine,—one on which much learning, argument, and passion, have been of late exhausted,—that is, whether, on general principles, a code is of any real advantage to a nation. To know this, it is necessary to know the several characteristics of written and unwritten, or, to speak more correctly, of enacted and unenacted laws. The comparative merits of these two systems will perhaps be better (at least more practically and popularly) stated, by a narrative of the circumstances and the method in which different nations have attempted to solve the problem, and by an examination into the discussions which have taken place in consequence, than by an analysis conducted in a more formal manner.

Municipal law is a rule of civil conduct prescribed by the supreme authority of the state. The legal rule ought in all cases to have the character of a rule. But it may exist, and in point of fact has existed, under very different formalities and presumptions in different countries. It begins in barbarous countries orally, and is necessarily continued in them by oral tradition. It is, however, everywhere committed to the custody of writing, as soon as writing becomes common. By some nations, as soon as it is put in writing, it is embodied into digests; by others it is separated into articulate propositions. Under some systems it is to be got at out of special precedents, by means only of comparison and analogy; under others it is understood to be contained, as matter of necessary inference, in a certain number of definitions and general principles. In the same manner, the rule expressive of the will of society must everywhere be supposed to be invested, first or last, with the sanction of society, speaking by the voice of its supreme authority, that is, by the voice of the legislature. But this sanction may be implied as well as expressed. It exists, although indirectly, in behalf of rules which, if they are made by others, the legislature nevertheless adopts, just as completely as it exists in behalf of those which the legislature has itself originated, and on which, therefore, it set its seal from the beginning. The prudence of an arrangement, by which an intelligent community consents to the surrender of the initiative by its legislature, thus countenancing a wanton confusion of judicial and legislative action, and leaving the law, as it were, all of a heap, comparatively inaccessible and unknown, is a different question. This may, in some cases, have been the least of two evils. But the exigencies of one state of society need not be made the deliberate choice of another. In the mean time, the various laws, pouring in from these different sources, though not equally open to the inspection of the public, are equally recognised by its members, as possessing the authority of law. The abuse, if any, is not transacted in a corner. There are popular usages, transmitted orally from generation to generation by the common report of neighbours, or, as in the city of London, certified by the mouth of the recorder: there are judicial principles, whether laid down by the prætor in general terms, or extracted from the decisions of courts in particular cases: there are the private opinions of learned text writers, such as the jurisconsults at Rome, or as Littleton, Coke, and Fearne in England: there is the uniform understanding of the profession, the *usus fori*, acknowledged even unto the practice of conveyancers. Whilst so many concurrent streams are notoriously feeding and filling the channels of the law, the silence of the legislature is equivalent to its assent. This, most of the advocates of a code are reasonable enough to admit. But it is the legal obligation which is thus impressed upon laws of this description, that constitutes the very ground of their complaint. They insist, that laws so diversified as often to clash, and so latent as often to remain unknown, can never adequately fulfil the characteristic conditions of a legislative rule. They propose, accordingly, that there should be only one form of law,—that of writing; and only one source of law,—that of express legislative enactment.

A complete code, of course, embraces the whole field of law, indeed every subject competent to be raised in a court of justice. Partial codes embrace only legal rights and obligations of a particular description. We shall look at the subject historically in the first instance. If its very principle and *rationale* have been left to be settled almost to our own times, this does not arise from a lack of early precedents; whilst it is to the credit of modern civilization that the argumentative statements latterly advanced on both sides of the case contain the greater part, if not all, of what philosophy can have to say about it. There have been codes of one sort or another in the world from the earliest ages. The title of a legislator was in great request with antiquity. It was an honour of the same order as that of the founder or restorer of a state. We must not, however, be the slaves of splendid names. It is difficult to believe that, on the formation of a semi-barbarous government, it could have the means or the desire of constructing an entire system of positive legislation; still less that it would think of admitting, in the course of its future progress, no laws to pass current but what were either originally produced in that mould, or what were as soon as possible thrown into it, in order that they might be reproduced under its stamp and fashion. This is one of the wants and achievements of wiser times. These ancient codes, instead of being born, like our first father, full grown, were diminutive, feeble births, and left outstanding a much greater mass of customary law. They extended to some few principal subjects only, and were probably not always the sole and exclusive authority even upon them. The proportion between the written law, thus enacted by the legislature, and the remainder of the law, which was derived from other sources, must have varied in different countries at the very commencement of their several societies. The proportion, unequal at first, must have gone on varying still more from age to age. If we should suppose the Twelve Tables, the capitularies of Charlemagne, the code of Alfred, to have constituted nearly the whole of the municipal law of their respective periods, this could not long remain so. The shape which their subsequent legislation might assume would, even in the same state, depend on very different considerations, at different stages of its history; whilst the course which might have been most judicious in one country might be most imprudent in another. Codes then, it is clear, have always existed more or less, of one sort or another, from time immemorial. The advantages and disadvantages also of this species of legislation vary from country to country, and from age to age. In most cases the experiment has been tried, concurrently with other kinds of legislation. This is the state of things which history from time to time necessarily presents. Accordingly a period must arrive in all civilized communities for subjecting the opposite pretensions of contrasted systems to the test of a philosophical and historical discussion. The general question, in what form laws are best authenticated, communicated, and preserved,—the particular question of code or no code in a given country,—are questions which (in whatever way they may be ultimately decided) must sooner or later come to be debated. Of course, we speak of countries where man is in movement, and where the population is sufficiently orderly and prosperous for the laws to spread out and accumulate to their natural extent.

Some persons seem determined to presume every thing in behalf of classical antiquity. It may be suggested therefore, that the evidence of its legislative deliberations upon this subject may have been lost; otherwise the silence of the most celebrated amongst the ancient states is a very suspicious circumstance. If they were never made aware of the necessity of meeting the question, they can have had little or no law on many important subjects. If they were too ignorant or indifferent to make serious provision for a satisfactory determination of it, they must have left their law in an imperfect, incoherent, desultory condition. There is no evidence come down to us from antiquity, that the demand for reducing the whole body of national law to principle and method was ever raised, except at Rome; nor at Rome, for practical purposes, by any body except by Cæsar and Justinian. On this point Cicero gives us the first and almost the only information we possess. His own views are so excellent, that, supposing them to have originated with himself, he must have created a school of law reformers. It is clear that Cicero regarded the writings of the Greeks upon politics and law as purely literary compositions. Under this conviction, he took great credit to himself for writing on law as a statesman. He looked at the laws and the commonwealth in connection with each other; and in all his observations had the Roman institutions principally in his mind. If the legal literature of Greece was too abstract to work with, in what relation stood their judicial jurisprudence? The Greek bar, if it was not of a kind to much embarrass Athenian reformers, must have been still more incapable of assisting to settle the law upon new and improved foundations. Nor is this the extent of the loss. Wherever lawyers are not a distinct and respectable profession, it may be taken for granted that there is little or no law. The jurisconsults of Rome, in the comparative infancy of Roman law, had already become more powerful by their authority than even by their talents. On the other hand, what could be expected of Greek lawyers, such as Cicero describes them by way of contrast: *Infimi homines apud Græcos mercedula addicti qui ministros se præbent in judiciis oratoribus?* Whilst jurists and judges apparently did but little for the cultivation of municipal law in Greece, was the deficiency really supplied from other sources—by popular usages or positive legislation? Cicero has not in this respect a word to say for the nursery of philosophy, literature, and the arts. On the contrary, Rome was in his opinion the only substantial home of virtue, dignity, and empire in all the world. The most vulgar lawyer, admiring his own little manual of practice, and despising the institutions of every other people, could not throw out a more scornful challenge than the comparison he puts into the mouth of Crassus, between the Roman laws and the laws of Draco, Solon, and Lycurgus. *Incredibile est, quam sit omne jus civile præter hoc nostrum inconditum ac pæne ridiculum; de quo multa soleo in sermonibus quotidianis dicere, cum hominum nostrorum prudentiam cæteris omnibus maxime Græcis antepono.*" Nevertheless, all the praise to which the civil law in the time of Cicero seemed entitled, was by comparison only. The black-letter wisdom of the Twelve Tables was losing its interest, except with antiquarians and moralists. In his childhood it had been taught as a sort of catechism to young people. He himself had learned it (*carmen necessarium*), in the way that their constitutional code is a prescribed lesson in the schools of some of the United States; but the practice had gone out of fashion during his lifetime (*De Legibus*, 25). Its old-fashioned authority was just then in the course of being displaced by the successive edicts of the prætors. *Non ergo a prætoris edicto ut plerique nunc neque a duodecim tabulis ut superiores sed penitus ex intima philosophia hauriendam juris disciplinam putant.* The annual code of the prætor could, however, at this period cover but a small corner of the field of law. The rest, such as it was, must have been given over into the hands of the jurisconsult. But the juridical learning of Rome, which was afterwards destined to acquire the character of written wisdom, and become the arbiter of the civilized world, was at that time in a state hardly removed from childhood. Cicero himself, in the oration for Muræna, treats it with the utmost contempt. *Primum dignitas in tam tenui scientia quæ potest esse?* As regarded the forms, *Dum erant occulta, necessario ab eis, qui ea tenebant, petebantur: postea vero pervulgata atque in manibus jactata et discussa, inanissima prudentiæ reperta sunt, fraudis autem et stultitiæ plenissima.* As regarded the substance, *Cum permulta præclare legibus essent constituta, ea jurisconsultorum ingeniis pleraque corrupta ac depravata sunt. Scientia, quæ tota ex rebus fictis commentitiisque constaret.* He finishes by saying, in case where Servius Sulpicius provokes him, that, overwhelmed with business as he is, he will undertake to make himself master of the civil law in three days: *Sapiens existimari nemo potest in ea prudentia, quæ neque extra Romam usquam, neque Romæ, rebus prolatis, quidquam valet. Peritus ideo haberi nemo potest, quod in eo, quod sciunt omnes, nullo modo possunt inter se discrepare: difficilis autem res ideo non putatur, quod et perpaucis, et minime obscuris litteris continetur. Itaque, si mihi, homini vehementer occupato, stomachum moveritis, triduo me jurisconsultum esse profitebor.* Nor was this contemptuous language the artifice of an advocate for oratorical effect. In the treatise *De Legibus* he speaks of the learning of the profession quite as slightingly; and declares that it consists but of mean things, *quæ et scripta sunt a multis diligenter, et sunt humiliora quam illa quæ a vobis expectari puto.* Again, in the treatise *De Oratore,* he states that their writings *neque ita multis literis aut voluminibus magnis continentur. Eadem enim sunt elata primum a pluribus; deinde paucis verbis commutatis, etiam ab eisdem scriptoribus scripta sunt sæpius.* And he adds, *Non dicerem hoc, audiente Scævola, nisi ipse dicere soleret nullius artis faciliorem sibi cognitionem videri.* Up to this period, therefore, notwithstanding the boasted superiority of the Roman law to that of all other nations, to what must the boast be in truth reduced? The foundation consisted of the Twelve Tables, whatever they might be worth. But almost the entire fabric was raised up by means of the annual edict of an annual unprofessional officer, professing to make his laws for the year, and to administer them upon the latitudinarian principles of a court of honour or of conscience. On certain subjects, the additional element of that occasional, partial, and conflicting legislation described by Tacitus, embroiled the fray. These new laws would raise up the debateable examination which Cicero mentions, into the old ones, whether, for instance, they are to be supposed *ipsa sua vetustate consenuisse aut novis legibus esse sublatas.* Now this was the state of the Roman law when Cæsar is understood to have aspired to the character of a legal reformer. The last-mentioned materials, produced by extensive and arbitrary legislation, at the passion and in the interest of opposite authorities, appear, in their complication, their contradiction, and their evil spirit, to have been the greatest grievance. What evidence have we of the measures which he contemplated? Gibbon's imagination seems to have taken wing without authority, when he anticipates on this occasion the avatar of a more than Roman Bentham. According to the rhetorical historian, if Cæsar had achieved the reformation of the Roman law, his creative genius, enlightened by reflection and study, would have given to the world "a pure and original system of jurisprudence." Suetonius is so far from supporting this conjecture, that he expressly restricts the intended amendment of the *jus civile* to the reduction of it within a moderate compass, and to the making out of its immense quantity of laws, a small compilation of those only which were best and most needful; *optima quæque et necessaria in paucissimos conferre libros.* If we suppose Cæsar to have meditated something more than this, it would probably have been an attempt to carry into his legislative digest that logical arrangement, by which Servius Sulpicius had perfected his practice, and by the aid of which Cicero insinuates that he himself had at one time thought of writing a didactic treatise on the civil law. Ought we to conjecture that this intention was really executed in the last books of the treatise *De Legibus?* In that case there is, more than ever, reason to lament their loss. The world would then have known what kind of a code the Roman republic had really the means of making. The passages in which Cicero intimates his views are therefore extremely valuable, as forming part of the history of the progress towards codification. The execution of these ideas would of course have had its own difficulties. But the conception of them places the universal genius of their author in a remarkable light. They afford ample proof of the spirit in which the only Roman philosopher and statesman that we ever read of was preparing the way for the legislative authority of the victorious dictator. Speaking of Servius Sulpicius, in the *Brutus,* he says, "*Existimo, juris civilis magnum usum et apud Scævolam, et apud multos fuisse; artem, in hoc uno; quod nunquam effecisset ipsius juris scientia, nisi eam præterea didicisset artem, quæ doceret rem universam tribuere in partes, latentem explicare definiendo, obscuram explanare interpretando; ambigua primum videre, deinde distinguere, postremo habere regulam, quâ vera et falsa judicarentur, et quæ, quibus positis, essent, quæque non essent consequentia.* To this passage must be joined the notice of the design, which he attributes to Crassus in the treatise *De Oratore.* He says, *Si enim aut mihi facere licuerit, quod jamdiu cogito, aut alius quispiam, me impedito, occupârit, aut mortuo effecerit, ut primum omne jus civile in genera digerat, quæ perpauca sunt; deinde eorum generum quasi quædam membra dispertiat; tum propriam cujusque vim definitione declaret; perfectam artem juris civilis habebitis, magis magnam, atque uberem, quam difficilem, atque obscuram.* More than five hundred years were allowed to pass before this conception was partially executed by Justinian. We say partially; for Justinian's plan falls far short of that of Cicero, although perhaps not more so than the plan of Cæsar would have done, when it came to be reduced to practice. The long interval which intervened, a period equal to the entire duration of some commonwealths, did not of itself render a change in the plan necessary, supposing that Tribonian had felt himself to be equal to the execution. But it brought along with it a necessary change in the materials. There had arisen in the interim a bright age of jurisprudence. The earlier legal authorities were thrown into the shade. The Pandects contain but three names which belong to the republic. Accordingly, the jurist finds as little of the civil policy of republican Rome in the imperial laws which pass under her name, as the antiquarian discovers of the ancient city within the modern walls. The new learning, whatever facilities it might create in one way, added to the difficulties in another. The intermediate five hundred years had been years of legislative despair. Justinian has boasted in his code that he had accomplished that *quod nemo principum, ante nostrum imperium, aut in mentem induci posse aut humano ingenio possibile esse existimavit.* On the whole, therefore, modern law-reformers must not look for much light, either as to the principles or the method of legislation, from the practice and opinion of antiquity. It affects to offer no information of any value except in the instance of Rome. In that instance, the only comprehensive view of which we are in possession was that of Cicero. Defining virtue to be *perfecta atque ad summum perducta natura;* declaring its object to be *naturam sequi et ejus quasi lege vivere;* explaining in this sense the moral philosophy of Socrates, as that by which we are to learn the most difficult of all lessons, *ut nosmet ipsos nosceremus;* he was led on to a similar doctrine in the case of universal law. Universal law is with him a *recta ratio imperandi atque prohibendi,* of which it is the very essence that it must be a *lex naturæ congruens, ad illam antiquissimam et rerum omnium principem expressa naturam.* If the entire treatise *De Legibus* had, by good fortune, come down to us, we should have known the degree to which Cicero, in setting down on paper the detail of his several codes, had ventured to approach to the execution of a scheme of natural jurisprudence. From the ridicule with which he describes the narrowness of all preceding Roman lawyers, even of the Scævolas, he certainly would not have blindly put himself into the same trammels, nor have committed the error of the school divines, in pounding the crystal into dust by infinite subdivisions. *Sed jurisconsulti, sive erroris objiciendi causa, quo plura et difficiliora scire videantur; sive, quod similius veri est, ignoratione docendi (nam non solum scire aliquid, artis est, sed quædam ars etiam docendi) sæpe, quod positum est in una cognitione, id in infinita dispartiuntur.* On the other hand, the practical principles which he professed, bound him to the doctrine, *Spartam nactus es; hanc exorna.* Besides, his particular declarations still remain to us. The course he was about to pursue was to exemplify his creed, that the laws and the government ought always to be in harmony with each other. Regarding the old Roman commonwealth as the best, and intending to give it appropriate laws, he adds, *Ergo adeo expectate leges, quæ genus illud optimum reipublicæ contineant: et, si quæ forte a me hodie rogabuntur, quæ non sint in nostra republica, nec fuerint, tamen erant fere in more majorum; qui tum, ut lex, valebat.* But, more than this, his specimens of codification on the two great heads of ecclesiastical and constitutional law have come down to us in the second and third book *De Legibus.* It is evident from these that he was extremely conservative of the ancient faith on these two important points, and was thus far at least resolved to deviate as little as possible from the beaten track of prescriptive authority into the open and debateable domain of reason. Mr Bentham, we think, could not have been induced to make similar concessions to national vanity or supposed expediency. There would have been some difficulty in persuading him into an apparent belief that he could make the standard of universal jurisprudence in matters of church and state happily fall in with the laws of Alfred and the Saxon code. But Cicero's legislation is Roman throughout. His idea of nature for this occasion, was nature as it existed within the walls and policy of the eternal city; consequently the interest of the work, so far from being universal, is principally the interest which attaches to every thing belonging to Rome, and composed by Cicero. Nor is the treatise calculated to be of greater use, as a precedent, to a codifier, from any advantages of method. And Cicero having disappointed us in the execution of his plan, can we expect the practical official law-reformers to be more philosophical? If the philosopher by profession, when he came to apply his theories, bowed before the *mos majorum,* in obedience to the strict and statesmanlike reserve of his nation, Cæsar and Justinian were not likely to have dreamed of being more latitudinarian. As masters of the world, they did not enter on the subject from any concern about the philosophy of legislation, but in the hope of lessening the burden of the obscure and conflicting laws which they were called upon to administer.

From this brief sketch, two things are evident in the case of the Roman law: first, what required to be done; next, the difficulty of doing it. Its evil condition had become not only perceptible, but so flagrant as to demand a remedy, as early as the time of Cæsar. Suetonius declares that the mischief consisted principally in the *immensa diffusa legum copia.*[1] Livy also and Tacitus repeat it. The complaint had become proverbial. It is admitted, moreover, that no remedy was applied till the melancholy crisis of the sixth century. At this extreme period, another, and soon indeed the only question, had arisen. It was this: Whether civilization should be left to linger out a few more decrepit years in impotent decline, or should come to a violent end at the hands of the barbarians? Whatever may be the imperfections in the legal production of Justinian—whether incident to the age or to the persons—it is acknowledged, not only that the older works on Roman law would hardly have been preserved at all, except for the different compilations of the many contemporary codes of this late season, "but, that it would scarcely have found entrance into modern Europe, had not Justinian's works been among them, in which alone the spirit of the Roman law is discernible." This is the statement of Savigny, generally regarded as the ablest opponent of codification in general, and certainly far from being an indulgent critic to the Justinian specimen in particular. Upon Savigny's own statement, therefore, posterity at least is under great obligations to Justinian for having rescued the floating materials from destruction. Nor can we see that there is any reason for supposing that the desirableness of presenting the materials in an accessible form was not acknowledged even at the time, by his contemporaries. True, there is no existing trace of any experiment towards a code having been made by Papinian, Ulpian, and Paulus, who were not only the three most celebrated jurists, but were also *præfecti prætorio.* But, to infer, that therefore they considered a code as neither necessary nor advantageous, seems a very rash conclusion. Their wishes may have been practically thwarted by a hundred causes, and the evidence of their wishes may have perished a hundred times over. Such is, in truth, the legal history of many countries upon this very point. Savigny admits that, in the time of the classical jurists, "there would have been no difficulty in forming an excellent code." But this being so, it is surely very much to be lamented that the middle period,—that between the infancy and the decline of Rome,—which, for this particular purpose, Savigny accounts the summit of appropriate civilization, was not taken advantage of. The actual generation might not itself be so much in want of a code as the generations that were to follow. But the highest duties of a statesman are partly prospective, in regard to affairs of this description. The opposite doctrine is poor indeed. The immediate generation itself, however, would probably have also been the better for it. Long before this middle period, the learned or technical element must have overgrown the natural or political one. The original confidence supposed to be possessed by a people in their common law must have disappeared. Accordingly, the only remaining problem—that which peculiarly belongs to an advanced stage of society—had already arrived: Ought artificial jurisprudence to be left at large, in all the varieties into which it branches out, or would it best perform its office by being from time to time consolidated, arranged, and authenticated in the shape of positive legislation?

In modern times, this arduous experiment has been tried upon the largest scale, and with the most success, by France. Political circumstances facilitated the legal innovation in a remarkable degree. The fury of the Revolution had made a clear space for the architects of the Code Napoleon to build upon. This was a great accommodation. But the necessity of a reformation, tantamount to a reconstruction of their whole legal system, existed previously, and had been admitted during two or three successive centuries by the most distinguished magistrates of France. Louis XI. "who had it in his mind (though he performed it not) to make one constant law of France, surely might have done well, if, like as he brought the crown (as he said himself) from Page, so he had brought his people from Lackey; not to run up and down for their laws to the civil law, and the ordinances, and the customs, and the discretions of courts, and discourses of philosophers, as they used to do."[1] The only question regarding the Code Napoleon must be as to the manner in which it was executed. None can be raised as to the necessity of a code.

---

[1] *In Vit. Cæsar.* c. 44.

Whatever may have been the incompetency of the French councillors of state on this occasion, there is no pretence for alleging that they were not sufficiently French, and that they ran wildly into foreign notions, revolutionary opinions, or abstract theories of human nature and general jurisprudence. For we are informed by M. Dupin, in his *Dissertation on the Life and Writings of Pothier*, that the treatises of that perspicuous and trust-worthy jurist furnished three fourths of that which is by far the most difficult and complex portion of law, the Code Civil. Mr Butler, in a learned note on Coke upon Littleton, disposes of what has been considered by many as one of the great boasts of modern civilization, in a very summary manner. After saying that M. Bernardi thinks that the Assizes of Jerusalem (which, in its present state, is a work of the thirteenth century) is superior to it, he adds, "The Codes Napoleon are five, the Code Civil, the Code Criminel, the Code de Commerce, the Code de Conscription, and the Code de Procedure. It is allowed that the first possesses great merit, that the third is very faulty, and that whatever is good in any of them is rendered almost entirely useless by the last, which has completely confounded and paralysed all the judicature of the country." The practical merit or working qualities of specific laws can be only properly estimated by a native lawyer. The character, therefore, of the different codes, as given by M. Dupin in his letter to Mr Sampson of New York, 1826, is entitled to much greater credit than the comparatively hearsay judgment of Mr Butler. Besides, it carries the evidence down to a later date. It is as follows: "The civil code is the first and best of all; it is clear and methodical; neither too long nor too short; the language of the legislature is noble and pure; the rules are well laid down, and, with the exception of the difficult subject of mortgages, it has met with nothing but approbation, more especially at the present time, since the immoral law of divorce has been struck out. The code of civil procedure has simplified the forms and diminished the expense of lawsuits. No fault is found with it, except in the law form of execution (*expropriation*), the unfortunate though necessary adjunct to the law of mortgage. The commercial code, which re-enacts, in a great measure, the ordonnance relative to maritime affairs of 1681, and that of 1673 relative to commerce, is also generally esteemed. The only exception is the title of bankruptcy, which is equally complained of, both by bankrupts and by their creditors. The code of criminal procedure, and the penal code, are the last, and are those to which the greatest objections have been raised. Despotism dictated them. In many instances state policy has made them her instrument; and liberty has suffered accordingly. Their revision has therefore been demanded even in the Chamber of Peers. But all these codes, such as they are, have been productive of the greatest benefit; they have delivered us from the chaos of our ancient law. Above all, the institution of the court of cassation, which acts, as at a central power, to regulate and check the decisions of all the other jurisdictions, has been of the highest benefit." What then is the result of this experiment in the instance of France? Under the opposition of local prejudices and private interests, it is very possible (as M. Dupin believes would have been the case), that, but for the Revolution, not even a Solon or a Lycurgus, placed on the throne of France, could have been sufficiently powerful to carry an effectual reform. The reform nevertheless would not have been the less wanted. It is absurd to consider the codes as political measures artfully plotted by Napoleon, because they happened to be digested at last under his counsel, and promulgated in his name. The *projet du code civil*, commenced as early as 1793, proves that it was completed to a considerable extent years before the name of Napoleon was heard of. It was owing to the previous discussions on the original propositions of Cambacérès, that the Code Civil was enabled to be brought out at the command of Napoleon, within the short period of four months. The code of France may be, and doubtless is, far short of abstract perfection; but, with all its faults, an immense majority of those who live under it, of those who practise it, and of those who administer it, allow it to have been amongst the greatest of national blessings.

The desirableness of a code of laws for any particular country, at any given period, is a question of fact. Royer Collard sensibly observes, that it is impossible to give, on so mixed and variable a case, one uniform answer applicable equally to all times and places. What may have been clearly good in France may possibly leave a doubtful balance of advantage in England. On the other hand, what it would have been dangerous to attempt a hundred years ago in England, may perhaps be easily accomplished to-day.

Before entering upon the case of England, it may be observed, that the question with regard to a portion of her provincial legislation has been latterly supposed to be placed beyond dispute. Whatever balance of opinion for and against codification may be found to be elsewhere keeping legislation in suspense, there is one part of the globe, namely, British India, in which almost every body conversant with the subject appears agreed. The governor-general in council, assisted both by the most experienced civil servants of the company, and by the judges of the supreme court, has certified that nothing short of a code, however slowly or gradually proceeded in, can meet the necessities of the case. The undertaking is certainly surrounded with many impediments, and will in its execution require at every step consummate prudence. On framing the precise provisions, some twenty different nations, now politically united under the British government, must be treated as distinct nations; varying sometimes in the spirit, frequently in the letter, of their laws. There is one branch, however, that of the criminal law, in which the difficulties belonging to this view of the subject are thought very lightly of. Yet it is the case of criminal law, to which, speaking of what has been called the best code of this kind in Europe, that of Bavaria, Mr Cooper has appealed as furnishing conclusive proofs in favour of Savigny's general objections against the present capabilities of Europe for framing codes. The judges of the supreme court of Calcutta are of opinion that "any one intelligent English lawyer, and one of the civil servants employed in the Nizamut Adawlut, with the assistance of the reports of that court recently published, might jointly prepare a regulation *in a few months*, which would be, for all persons throughout India, *as good a penal code as any now existing in the world*."[2] In the instance of India, the nature of the specific evils to be provided for by a code cannot be more powerfully stated than in the words of one who has been since deputed to the high office of ascertaining and superintending the remedies to be applied. The passage to which we allude is contained in a speech delivered by Mr Macaulay, in the House of Commons, on the last renewal of the charter. The reader will there see, to what complexion unwritten law, that is, law derived from other sources than the legislature, has a tendency to come. A force like that of gravitation is always dragging it in this direction. “ Having given to the government supreme legislative power, we next propose to give to it for a time the assistance of a commission, for the purpose of digesting and reforming the laws of India, so that those laws may, as soon as possible, be formed into a code. Gentlemen, of whom I wish to speak with the highest respect, have expressed a doubt whether India be at present in a fit state to receive a benefit which is not yet enjoyed by this free and highly-civilized country. I can allow to this argument very little weight beyond that which it derives from the personal authority of those who use it. For, in the first place, our freedom and our high civilization render this improvement, desirable as it must always be, less indispensably necessary to us than to our Indian subjects; and, in the next place, our freedom and civilization, I fear, render it more difficult for us to obtain this benefit for ourselves than to bestow it on them. I believe that no country ever stood so much in need of a code of laws as India, and I believe also that there never was a country in which the want might so easily be supplied. I said that there were many points of analogy between the state of that country after the fall of the Mogul power, and the state of Europe after the fall of the Roman empire. In one respect the analogy is very striking. As in Europe then, so in India now, there are several systems of law, widely differing from each other, but co-existing and coequal. The indigenous population has its own laws. Each of the successive races of conquerors has brought with it its own peculiar jurisprudence; the Mussulman his Koran and its innumerable commentators, the Englishman his statute-book and his term-reports. As there were established in Italy at one and the same time, the Roman law, the Lombard law, the Ripuarian law, the Bavarian law, and the Salic law; so we have now in our eastern empire Hindu law, Mahommedan law, Parsee law, English law, perpetually mingling with each other, and disturbing each other; varying with the person, varying with the place. In one and the same cause the process and pleadings are in the fashion of one nation; the judgment is according to the laws of another. An issue is evolved according to the rules of Westminster, and decided according to those of Benares. The only Mahommedan book in the nature of a code is the Koran; the only Hindu book the Institutes. Everybody who knows those books, knows that they provide for a very small part of the cases which must arise in every community. All beyond them is comment and tradition. Our regulations in civil matters do not define rights; they merely establish remedies. If a point of Hindu law arises, the judge calls on the Pundit for an opinion. If a point of Mahommedan law arises, the judge applies to the Cauzee. What the integrity of these functionaries is, we may learn from Sir William Jones. That eminent man declared, that he could not answer it to his conscience to decide any point of law on the faith of a Hindu expositor. Sir Thomas Strange confirms this declaration. Even if there were no suspicion of corruption on the part of the interpreters of the law, the science which they profess is in such a state of confusion, that no reliance can be placed on their answers. Sir Francis Macnaghten tells us, that it is a delusion to fancy that there is any known and fixed law under which the Hindu people live; that texts may be produced on any side of any question; that expositors, equal in authority, perpetually contradict each other; that the obsolete law is perpetually confounded with the law actually in force; and that the first lesson to be impressed on a functionary who has to administer Hindu law is, that it is vain to think of extracting certainty from the books of the jurists. The consequence is, that in practice the decisions of the tribunals are altogether arbitrary. What is administered is not law, but a kind of rude and capricious equity. I asked an able and excellent judge lately returned from India, how one of our Zillah courts would decide several legal questions of great importance, questions not involving considerations of religion or of caste, mere questions of commercial law. He told me that it was a mere lottery. He knew how he himself should decide them, but he knew nothing more. I asked a most distinguished civil servant of the company, with reference to the clause in this act abolishing slavery, whether at present, if a dancing-girl ran away from her master, the judge would force her to go back? ‘ Some judges,’ he said, ‘ send a girl back; others set her at liberty. The whole is a mere matter of chance. Every thing depends on the temper of the individual judge. Even in this country we have had complaints of judge-made law; even in this country, where the standard of morality is higher than in almost any other part of the world—where, during several generations, not one depositary of our legal traditions has incurred the suspicion of personal corruption—where there are popular institutions—where every decision is watched by a shrewd and learned audience—where there is an intelligent and observant public—where every remarkable case is fully reported in a hundred newspapers—where, in short, there is every thing which can mitigate the evils of such a system. But judge-made law, where there is an absolute government and a lax morality—where there is no bar and no public—is a curse and a scandal not to be endured. It is time that the magistrate should know what law he is to administer; that the subject should know under what law he is to live. We do not mean that all the people of India should live under the same law: far from it: there is not a word in the bill susceptible of such an interpretation. We know how desirable that object is; but we also know that it is unattainable. We know that respect must be paid to feelings generated by differences of religion, of nation, and of caste. Much, I am persuaded, may be done to assimilate the different systems of law, without wounding those feelings. But, whether we assimilate those systems or not, let us ascertain them, let us digest them. We propose no rash innovation; we wish to give no shock to the prejudices of any part of our subjects. Our principle is simply this: uniformity where you can have it—diversity where you must have it—but in all cases certainty. As I believe that India stands more in need of a code than any other country in the world, I believe also that there it no country on which that great benefit can more easily be conferred. A code is almost the only blessing—perhaps it is the only blessing—which absolute governments are better fitted to confer on a nation than popular governments. The work of digesting a vast and artificial system of unwritten jurisprudence is far more easily performed, and far better performed, by few minds than by many—by a Napoleon than by a chamber of deputies and a chamber of peers—by a government like that of Prussia or Denmark, than by a government like that of England. A quiet knot of two or three veteran jurists is an infinitely better machinery for such a purpose than a large popular assembly, divided, as such assemblies almost always are, into adverse factions. This seems to me, therefore, to be precisely that point of time at which the advantage of a complete written code of laws may most easily be conferred on India. It is a work which cannot be well performed in an age of barbarism—which cannot, without great difficulty, be performed in an age of freedom. It is the work which especially belongs to a government like that of India—to an enlightened and paternal despotism.”

---

[1] Bacon.

[2] Appendix, 5, *Affairs of the East India Company*, 1831.

We proceed to refer in the most summary manner to the domestic history of codification in England. Our observations will relate to what has been performed, and what projected by parliament; and, next, to the principal arguments and objections on both sides out of doors, as we find these elicited in the course of the discussions from the reign of Elizabeth down almost to the present time.

On tracing the course which the English parliament has followed with regard to the defects of English law, its course will be found to have hitherto been marked by its habitual reluctance to great changes. Law-reformers need not shrink from discussion. But, owing to the prevalence of apprehensions and jealousies, and from a weak subservience to personal interests, many of our most useful reforms have been hitherto introduced and passed with as little noise as possible. In point of fact, therefore, English codification, whilst it has taken place to a considerable extent, has only been partial. Some of its experiments have been confined to a mere consolidation and amendment of concurrent or conflicting statutes; others have, by adding the incorporation and revision of the corresponding portion of the common law, gone the whole length of codification on particular subjects. This is admitted, and even approved of, both by Mr Reddie and Sir Edward Sugden; on which Mr Humphreys naturally observes: "Whether the result be termed a code, or be an act, or a series of acts, to amend and consolidate the laws in question, is a mere question of words. Many of our present reforming and consolidating acts, for instance those relating to the customs and the excise, to crimes against property, to trustees and mortgagees under legal disabilities, to bankrupts, to insolvent debtors, are all in effect distinct parts of a code; correcting and embodying all prior laws and rules, whether statutory, judicial, or textuary, on the same subject." The necessity of such a revision, and the mode of making it, are amongst the different matters submitted to the several commissions appointed of late years for inquiring into the different departments of the English law. Important parts of the law of real property will be shortly comprised in express legislative provisions under the recommendation of the real property commission. It is true, that the amendments of the criminal law, brought in under the sanction of Sir Robert Peel, are chiefly examples of the process of statutory consolidation only. But the present commissioners on the criminal law have closed their first Report (1834, p. 35) with a strong opinion that "the combination of a digest of the statute law with that of the common law, into one body of criminal law, is a measure which will tend greatly to the improvement of the jurisprudence of the country. In support of our views upon this subject," they add, "we may observe, that the definitions of crimes, the nature of punishments, and the forms of criminal procedure, originated, for the most part, in common-law principles. But most of the unwritten rules touching crimes have been modified by acts of the legislature, which assume the terms and definitions of the common law. And thus it happens that the language in which these acts are expressed, and the subjects to which they refer, are commonly unintelligible without a knowledge of the common law. The actual law in regard to any particular offence lies partly in the statutes, and partly in the reports and text-books. A reference to a single instance may be sufficient to illustrate our meaning. A modern statute makes it essential to the statutory offence, that it does not amount to an offence at common law, and thus the common-law description of the offence must be referred to for the purpose of ascertaining the limits of the statutory offence. As one digest, therefore, would be imperfect without the other, this seems to be a sufficient reason for uniting them. But it may be further urged, that most of the advantages which may be expected to be derived from a consolidation of the statute law will be attained by combining the two digests into one body of criminal law; and, in particular, the size of a joint digest would be much more compendious than that of two separate digests, and, what is still more essential, the means afforded by methodical arrangement, and by the context, for construing the intention of the legislature with certainty and precision, would, if the two digests were united, be greatly increased."

The above Report was accompanied by a digest of the common law of theft. It is given as a specimen of what may be accomplished in the case of an offence, the decisions upon which are more technical, complicated, and confused than any other portion of the English criminal law. But the public and the profession will soon have the means of judging with greater precision how far this encouraging expectation is likely to be realized. For, on alluding to the subject in the following year, in their Report on the general question of the propriety of a consolidation of all the statutes, civil as well as criminal, they state that they had already made considerable progress "in forming a digest of the criminal law, as well unwritten as written, into one statute, with such partial alterations as might be considered to be necessary or expedient for more simply and completely defining crimes and punishments, and for the more effectual administration of criminal justice." The criminal digest, although it will be the first executed, can only be meant to be a beginning. The example will do much. But, independently of the example, their general recommendation in favour of a statutory incorporation comprehends every case where statute law and common law are mixed up together. It can never be intended to do any thing so anomalous as stop here; as it were solely for the purpose of excluding from the national code that small remainder of the common law, with which it may have happened that no legislative enactments had ever interfered. They mention three plans. The first suggests a mere redaction of existing statutes, by clearing them of whatever in form or in substance is superfluous or obsolete. The second plan proposes to go a step further, and, by consolidation and classification, to bring the whole statute law into a systematic form. But the last goes further still, and advises that, wherever judicial decisions have altered the natural meaning of the words of an enactment, the enactment itself should be forthwith verbally corrected, so as to make its apparent import correspond with its legal effect. On this, their final recommendation, they observe that "no plan of reformation short of remodelling the statute law on the third principle proposed will be co-extensive with existing evils; but that whilst such a reform would be highly desirable, and is in their opinion practicable, its execution would be difficult, would require the greatest caution, and occupy a considerable portion of time." These are vigorous resolutions; and if once duly acted on, the English legislature will soon recover whatever ground it may have lost.

The above statement comprehends nearly all that England has yet performed in parliament upon this subject. Before passing on to the next point, namely, what she has projected, it is proper, in connection with this part of the case, and almost as a portion of it, to notice what the American legislatures have been doing. Their principal legal materials are so nearly identical with, and their circumstances for this purpose so similar to our own, that the question of codification is substantially the same question in both countries.

America, during her short political career, has proceeded in this great undertaking with a remarkable union of zeal and caution. Mr Livingstone had comparatively easy work in Louisiana, which stands alone in this respect. The civil law on which he had to work was already systematized; and the Code Napoleon was, *mutatis mutandis*, ready to his hand. The committee appointed to revise the statutes of New York brings us on English ground. It published, as early as the year 1827, an analysis of a portion of their labours. The charge committed to them was limited to the statute law. But they seem to have considered that they could perform this limited duty very imperfectly, unless they also included in their operation the interpretations which the courts of justice had put upon the statutes. This precedent appears to be precisely that which the English commissioners have since adopted, as far as they have gone. The following passage will explain the views taken at New York. "In attaining the object prescribed to us, to collect together the various provisions on the same subject, to introduce, in their proper places, the successive alterations which had from time to time been made by the legislature, it was obviously impossible to preserve the original language of the statute which was amended, and of the amendments. Parts of sections have been repealed and qualified, and an amendment had again been amended. Enactments are frequently contained in *provisos*, and, in the haste with which statutes are often drawn, the language frequently does not express the precise intent, or expresses more than was intended. In these cases, changes in phraseology were unavoidable. In other cases it became necessary to break up sections containing provisions on distinct subjects, or containing complicated and voluminous details and provisos, in order to distribute them in their proper places, and to arrange them in a natural order. This also unavoidably produced a change in the language. Some statutes which were passed in different years in England, explaining or amending others which preceded them, have been copied into our volumes, with the original acts which were the subjects of amendment, in the very language which had required subsequent legislation. In the same manner, later statutes, which were intended to include prior acts, have been retained with the acts so included. In some instances, by the omission of *preambles*, a different meaning was given to the statutes. In these cases great changes were indispensable. We have not been able to understand why the language of the written law should defy all attempt at improvement, more than the language of any other science, or upon any other subject. It must be susceptible of emendation, by undergoing the process which improves every other production of human skill; and more especially when new interests and new wants arise, which it was not originally intended to embrace. Still, whenever it was practicable, and consistent with the general plan of the revision, we have preferred to retain the important words of the present statutes, unless they have received a settled construction, which would not at once occur to an attentive reader. In these cases the language of the courts has been substituted, whenever it appeared 'more plain and easy to be understood.' In doing so, and in expressing the supposed meaning of various statutes, we have been guided by the decisions of the chancellors and judges of our state, under whose examination almost every statute embraced in this part has at intervals been brought. Those decisions form a body of practical construction and exposition, as honourable to those who made them, as they have been useful. Their utility will be consummated by transferring them into the very body of the statute which they illustrate and explain. And it is one of the results of the arrangement adopted, which gives us the greatest satisfaction, that it has enabled us to incorporate with the law the expositions it has received, and thus communicate directly to those who examine the statutes, for information and government, their sense and intent, as understood by the events. For forty years our statutes have been the subject of professional criticism and judicial exposition. For centuries those borrowed from England have been, in like manner, illustrated and expounded. If at this time a knowledge of their meaning and of their defects has not been attained, it probably never can be acquired. But it is believed that a meaning has been affixed to them, that their discrepancies and incongruities have been ascertained, and that industry and care only are necessary to comprehend that meaning, and to be apprised of those defects. It will, therefore, not be a difficult task to determine whether we have or have not faithfully rendered the existing law whenever we have professed to do so, and whether the imperfections we have supposed to exist are not such, and whether the suggested alterations are or are not necessary and expedient." The Report in the same year, 1827, of the Committee of South Carolina, in favour of a code of the statute and common law, was thought so convincing, that it overcame the previous scruples of their legislature, and its execution was afterwards directed. Mr Wilson's speech must have done much towards converting all whom argument was calculated to convince. According to his recommendation, the common law will be left in the extended form of a digest, instead of being compressed into precise enactments. He sees, like Bacon, a stronger objection to touching the form or language of the common law, than is felt by his professional brethren, the commissioners consulted in England or in New York. It cannot now be long before the two systems, as respectively proposed in New York and in South Carolina, are at work. The old English system remains undisturbed in the other states. Three several methods will therefore be then going on together under nearly similar circumstances. In each instance their practical effect must accordingly be soon observed. Considering the premeditation with which the English legislature proceeds, there can be little doubt but that some definite results, nearly decisive one way or the other, as to the obstacles which the peculiarities of the common law are supposed by some people to interpose in the way of codification, will thus have been arrived at in the United States, before it can be expected that the recommendation of the English commissioners shall come to be acted upon in England. The following is an apposite extract from Mr Wilson's speech: "I would, in the first place, recommend a general and careful classification of the whole statute law, which should be printed and put in the hands of the citizens, with a well-digested index. All acts of a homogeneous nature should be reduced to one act, with reference in the marginal notes to the statute from whence it is taken. The verbose jargon of the acts should be reduced to precise and definite terms. The division should be into chapters and sections, so that a reference to any particular act, or part of an act, would be rendered easy. Immediately after the acts, should be noted the decisions of our courts upon them respectively, and the point ruled should be set down in plain and direct terms, and the point ruled only. So much of the common law as relates to the subject of any particular division, should follow in the nature of a digest. If this plan was well executed, a great deal would be gained. I would require the judges, when any new case arose which was not provided for by the laws, to give it the best determination in their power, which decision should be the law of that case; but it should be their duty to report the case to the succeeding legislature, so that a law might be enacted to meet future cases of the like kind. Thus, if the representatives of the people were true to their trust, they would be enabled to keep the laws *in pari passu* with judicial legislation. It is a fact, not to be resisted, that the judges make more laws than the legislature, notwithstanding the inhibition of the constitution, which specially requires that the three great co-ordinate branches of the government should be kept for ever distinct. I do not think it would be well, and certainly very difficult, to break up the common law into legislative enactments. Lord Bacon has said, that the work which he propounded, 'tendeth to pruning and grafting the law, and not to ploughing it up and planting it again: for such a remove he held, indeed, for a perilous innovation.' I agree entirely with this opinion. No legislative reconstruction of the common law should be attempted, nor would it be requisite. When the digest of it should be made and settled, the statutes classed and purged of their verbosity, contradictions, and uncertainties, a short enactment declaring the code to be the law of the land, as well with respect to the common as the statute law therein contained, would be all-sufficient. Thus, afterwards weeding out all the cumbrous references which, however useful now, as vouchers indicating the authentic sources of the text, would become useless when the text should be established as authentic in its own right; after settling the disputed points, by declaratory or explanatory enactments; and after constituting the digest in its own natural miscellaneous style, it would be practically found to answer every useful purpose of municipal law, better than the most copious enactments. Whoever undertakes the work must guard against the omission of any obscure or straggling rule, enactment, or decision, in any stage of the work. He should take care not only that each enactment, rule, and decision, be included, but that it be inserted in *every* division with which it can properly be deemed to connect itself. In the index, which will accompany each process of the work, the reference to every topic should be registered, not *merely* under *one* appropriate title, but under *all* the titles under which it could reasonably be sought. The marginal abstracts in each enactment, or other article, should be constructed in such a manner as to give to each word its appropriate sense and proportionate value with respect to the *entire* subject to which the particular article so abstracted or analysed may relate. I have thus briefly stated my views of the plan of a code, and suggested some rules to be observed in carrying the plan into effect. I hope I have satisfactorily established the following points:

"1. That our laws are in that crude and indigested state, that they are a mystery to all but those of the profession.

"2. That every nation, in its progress to civilization, has acknowledged the propriety and necessity of reducing its laws to the form of a code.

"3. That the practicability of doing this has been established by every people that have attempted it.

"4. That it is imperative upon the legislative authority to reduce the law to writing, and, when so reduced to a code, to promulgate it in a way so public that every inquiring citizen may know it.

"5. That to punish the infraction of an unknown law, which no ordinary diligence or foresight could have acquired, is against the dictates of common sense, as well as revelation.

"6. That much of the common law of England made of force here, partakes largely of the ignorance and superstition of the age that produced it, and should be abolished by legislative authority."

The next stage in the history of English law reform brings us to the schemes or approximations towards a code, which have been at different periods unsuccessfully debated in the English legislature. From the reign of Elizabeth unto the present day, parliament has never lost sight of the necessity of an amendment of the law more or less extensive. Subject to two exceptions, it, however, never carried its views beyond a revision of the statutes. These exceptions are the criticisms of James I. on the common law, in his speeches at Whitehall in 1607 and 1609; and the directions submitted to the committees which were appointed in the years 1652 and 1653, during the Commonwealth. James, coming from the more liberal and scientific system which Scotland had borrowed from the civilians, and, moreover, a scholar of extensive reading, was naturally shocked at the pedantry, meagreness, and looseness, in which he found the legal system, if it could be so called, of his new kingdom. It was his favourite wish to assimilate, as much as possible, the laws of England and Scotland; a wish since indulged in by Lord Hardwicke and Lord Kames, but equally in vain. If James had succeeded, the project could have been accomplished only by means of a code. The first of the Commonwealth committees was instructed to report generally upon the inconveniences of the law; the second, to consider of a new model or body of it. The first committee, of which Sir Matthew Hale was a member, reported a revised system of law to the house within the year. But it is plain, from the shortness of the time taken, that it can have been nothing more than a sketch; perhaps detailing the general views contained both in his preface to Rolle, and in his considerations touching the amendment of the law, which have since been printed by Mr Hargrave. If the system thus reported had been, as Mr Cooper has described it in his Letters on the Court of Chancery (p. 153, note), *un livre qui contenait un système complet des lois*, it seems impossible that a work of this importance, from the hands of Hale, Cooper, and Rushworth, should have been lost. The reverence which from the first gathered around the name of Hale, and which has since faithfully abided by it, would have prevented such a result. Cromwell attributed his failure, as Ludlow has recorded, and as Mr Bentham rejoices in repeating, to a conspiracy amongst the lawyers, the sons of Zeruiah. But Ludlow was politician enough probably to be well aware of the real reason why "a reformation of the laws was so much desired by those then in power, and, on the other side, as industriously and warily declined and shifted off by many good and knowing men that were respected in those times." At all events, Mr Bentham might have learned it in Hale's fourth chapter "on some things necessarily to be premised, touching the matter, the manner, the persons, and the season of public undertaking for a reformation of the laws." And Mr Cooper would have found there the utmost extent to which any parliamentary report or system subscribed to by Hale at that period could possibly have gone. "The things desired were many of them for the matter good; but the end and design, and the state and condition of things, would not allow of such an undertaking. And therefore those that were solicited to undertake that business rather chose to propound such things only to be done as might be done by the power of courts of justice, but declined whatsoever required a new law to authenticate it." Lord Colchester, in a Report to the House of Commons on temporary and expiring laws, as early as 1796, set forth at length a long array of the several ineffectual attempts which had been made by parliament, year after year, towards a revisal of the statutes. The narrative has been subsequently copied into almost every publication directed to this object. The failure cannot in fairness be laid at the door of the lawyers. As a body, they have been amongst the loudest to complain of the evil of the present system. But, doing so, they would have performed this duty very imperfectly if they had not equally protested against the quackery of insufficient remedies. The cause of the delay which has taken place is sufficiently obvious. In the successful commencement made by the professional commission at last appointed, the grounds of the failure of all former schemes for consolidating the law is at once explained. Parliament is really incompetent to the task. Nevertheless, it would never before, except during the commonwealth, intrust the task to a separate and permanent commission, capable of doing for it that which it was incapable of doing for itself. If James I. could have taken as wise and prudent a course for the law of man as he took with the law of God (see his Letter, in 1604, to the archbishop, for the naming of fifty-four learned persons to translate the Bible), he might have identified his reign with another lasting service to the kingdom. At all events, if the work had been so completed, government would have set an example such as the public is entitled to expect from its superior station. It is true, the work might have been afterwards thrown aside. This has been the case with the *reformatio legum ecclesiasticarum*, the code of which was prepared even at a still earlier period. The labours of Cranmer and the other commissioners who were appointed under 27 Hen. VIII. and 3 Edward VI. to correct the canon law, have ever since been unaccountably neglected, both in and out of parliament. The consequence is, that a great division of the English law, which, properly authenticated and amended by the legislature, might have lived and done the state some service, has lain, for upwards of two centuries, civilly dead, and covered with the dust of contempt and oblivion. The same neglect cannot produce the same consequences in the case of temporal laws. But it does something of the sort; much more, from the silence with which it works, than most people are aware.

Thus much for the puny and abortive adventures, or rather the inroads, made into this unknown territory by parliament itself. English legal literature has been a little more active. This literature begins with Coke and Bacon, and it opens with a demand for law reforms. James I. had, amongst other things, required that there should be one plain penal statute, taking care not to repeal what had been profitably woven into the common law. Of this, Lord Coke promised that, "God willing, somewhat in due time shall be performed." Yet Coke left it to be begun upon by his successors, and they passed it on and on downwards to Sir Robert Peel. The distinction by which Coke acknowledges, that, "to reduce the penal laws into method and order were an honourable, profitable, and commendable work for the whole commonwealth," yet adds, "for the bringing the common law into a better method, I doubt much the fruits of that labour," is a distinction we do not comprehend. It is a distinction the less intelligible in the person of Lord Coke; since it is admitted by a vehement opponent of codification, that Coke's great work, "under the title of Reports, is in truth a most masterly and powerful redaction of each head of law to which his reported cases bring him." In other words, it was "a bringing of so much of common law into a better method." The method and the service of this compilation were so universally recognised, that Bacon, notwithstanding his personal enmity, bears witness that, "to give every one his due, had it not been for these Reports, the law by this time had been almost like a ship without ballast." Lord Bacon was both a philosopher and a lawyer. Great weight is deservedly attributed to his name, wherever it can be enlisted on either side of any argument. From the pertinacity with which the rival parties in this dispute have struggled to grace themselves with his sanction, it might be inferred, that, if his authority be great, his obscurity is still greater. This makes it necessary to examine, with some minuteness, the evidence, as it exists, concerning his opinions. It is admitted by the adversaries of codes, that his Aphorisms, taken by themselves, might mislead superficial readers. But audacious codifiers are remanded, for an answer to them, or an explanation of them, to the proposition made by him to James I., "touching the compiling and amendment of the laws." The precise measures there recommended, it is said, conclusively control the general expressions in his Aphorisms. On a closer inspection, however, it will be found that a comparison between the two leads to no alteration in either. If it did, the rule that, between two contradictory opinions, the latter abrogates the former, would oblige us to enlarge the practical measures of the attorney-general of the year 1613 into conformity with the deliberate maxims of the ex-chancellor of the year 1623; for the Aphorisms were the later work, and were originally published by him in 1623, as a portion of the first part of his *Great Instauration of the Sciences*. Bacon never appears to have wavered as to the necessity of something very like a code. It had been one of the first objects of his legal life, and it was evidently a favourite object with him to the last. Towards the close of the reign of Elizabeth, he thanks her Majesty "for having imparted to him a purpose, for these many years infused into her breast, to enter into a general amendment of the state of her laws, and to reduce them to more brevity and certainty." By way of contributing to this end, he inscribes to the queen a selection of twenty-five out of three hundred maxims. He had set himself upon extracting out of the books the essence as it were of the law, with a general view to the amendment, "in some measure, of the very nature and complexion of the whole law; since particular positive learnings of laws do easily decline from a good temper of justice, if they be not rectified and governed by such rules." The Aphorisms also, although published, for the first time, towards the close of his life, had been amongst the cherished meditations of his early years. They are in truth the self-same supplements which, in the *Advancement of Learning*, as far back as 1605, he had promised, "having begun a work of this nature to propound hereafter." So far from their being in contradiction with the practical measures recommended by him when attorney-general, the measures are applications, and almost translations, of the greater part of them. It is thus shown, that the principles of his Aphorisms must have lain by him, carefully treasured up, as rules to proceed by, for many years. There can be no falser view of the conduct of the great father of experimental philosophy on this occasion, than to suppose that he was a law-reformer in the abstract only; or that his theory was one thing, and his practice another. The measures actually proposed by him are such as, were they to be agreed upon, would bring the dispute amongst reformers within narrow limits. His plan, as laid before James I. is as follows. It consists of three parts, 1*st*, a reforming and recompiling of the statute-law; 2*d*, a reducing and perfecting of the course of the common law as contained in the reports; and, 3*dly*, the further paternal office of certain introductive and auxiliary books touching the study of the law. For the sake of civilians, he has added in his Aphorisms a caution which, addressing a king of England, it would have been superfluous to include in the above practical arrangements. The English system has never acknowledged the direct authority of text writers. Bacon was, however, well aware of the encroachments by which institutional or legal literature had become *authentic* in the civil law, and also of the degree to which both legislative and judicial authority had been thus seriously undermined. Accordingly, he provided against the occurrence or continuance of the evil, in his seventy-eighth Aphorism. But there is further evidence that this great man separated theory from detail as little in law as in philosophy. In his old age, and after his disgrace, that is, contemporaneously with the first publication of the Aphorisms, he was as anxious as ever for the royal permission to realise their application at home. The renewal, at this mournful period, of his offer to the king of a digest of the laws of England, is at once a commentary on the permanence of his opinions, and a testimony of the earnestness with which he held them. "I have commended them," he says on this occasion, "for the matter, but surely they ask *much amendment for the form, which to reduce* *and perfect, I hold to be one of the greatest dowries that can be conferred upon this kingdom.*" There is an air of touching and melancholy self-reproach, joined to a consciousness of the importance of the proposition which he was making, in his concluding words. One could almost imagine that he was looking to this occasion as a providential means by which he might indemnify his country for the scandal he had brought upon its justice, and might redeem in some degree his own judicial fame. " Your majesty is a great master in justice and judicature, and it were pity the fruit of that your virtue should not be transmitted to the ages to come. Your majesty also reigneth in learned times, the more (no doubt) in regard of your own perfection in learning, and your patronage thereof; and it hath been the mishap of works of this nature, that the less learned time hath (sometimes) wrought upon the more learned, which now will not be so. As for myself, the law was my profession, to which I am a debtor; some little helps I have of other arts, which may give form to matter; and I have now (by God's merciful chastisement, and by his special providence) time and leisure to my talent, or half talent, or what it is, to such exchanges as may perhaps exceed the interest of an active life. Therefore, as in the beginning of my troubles, I made offer to your majesty to take pains in the story of *England*, and in compiling a method and digest of your laws, so have I performed the first (which rested but upon myself) in some part; and I do in all humbleness renew the offer of this latter (which will require help and assistance) to your majesty, if it shall stand with your good pleasure to employ my service therein."

The importance attributed, and justly, to the opinions of so extraordinary a man, must be our excuse for going a little more into particulars, in order to show that there is no opposition to be reconciled. Indeed, on the contrary, the Aphorisms of Lord Verulam the philosopher, and the propositions of Sir Francis Bacon the attorney-general, throw light upon each other, and must have been meant to do so. The statute law is divided from the common law in the Proposal. The two are separated in the same manner by Aphorism 61. The Proposal divides the suggestions for the reformation and recompiling of the statute law into four parts. These agree with Aphorisms 54, 60, and 78. The common law he emphatically calls, in the Proposal, by way of distinction from the statutes, the laws of England. The way " to reduce and recompile" them, he conceives, should be laid down as follows: In the first place, he requires a full examination of the judicial records, that they may be set down and registered (rarely *in hæc verba*), so as to show in order of time, not by title, the antiquities of the law. This recommendation coincides with Aphorisms 76, 86. In the next place, he requires that there should be prepared a complete series of the year books or reports from the time of Edward I. to this day, leaving out all such cases as are obsolete, and all such points as are merely idle queries; of identical cases, retaining those only which are best reported and argued, specially noting what cases have been so long militant, that they must be brought before the exchequer chamber or parliament to be set at rest; cutting off from prolix cases all tautologies and impertinencies, and rectifying errors by the record. These recommendations coincide with Aphorisms 60, 72, 73, 74, 75, 89, 91, and 92. A note subjoined to this part of his propositions shows to how late a period he was zealously watching and preparing the necessary means for carrying his scheme into execution. He observes, that, in order to secure competent reporters, he had obtained of the king, *when he was chancellor*, the appointment of two grave and sound lawyers, with a stipend of L.100 a year a piece. This constitution of reporters, he vainly hoped, was thus " settled for all times." These were Bacon's amendments of the past, and his provisions for the present. They might be expected to secure the future also, as far as human prudence can secure it. But Bacon was not content with this. Knowing the frailty of man, and the influence of the innovator time, Aphorisms 55, 56, 57, and 58, recommend, that, from every three to five years, parliament should revise the jurisprudence which had been forming during the interim. For this purpose, special commissioners are to examine into and report upon contradictory decisions, under express directions not to seek out ingenious distinctions for reconciling inconsistencies, so as, *omnia, ut loquuntur, salvare.* These commissioners are to be vested with the power, *ex officio*, of clearing away all obsolete laws, against which even courts of equity are to be authorized to decree. It is a sign of Bacon's good sense in the affairs of life, that he did not embarrass the former measures of immediate urgency by adding this ulterior recommendation to those enumerated in the Proposal. When the law had once been reformed, it might have been introduced at any future time. Bacon's third object, —the official composition of auxiliary books conducive to the study and science of the law,—was a distinct consideration, with which we need not trouble ourselves at present.

Now, the above statement proves two things beyond dispute. It proves, first, that by Bacon's plan, the statute law and the common law were to be kept distinct; that each was to preserve its own ancient speech; and that, whilst he dared not advise casting the law into a new mould, yet both statute law and common law were to be alike consolidated, corrected, and arranged. It proves, secondly, that the entire body and substance of the law, thus consolidated, corrected, and arranged, should be authenticated as law by the express sanction of the state; and that the successive jurisprudence of the country should be constantly kept in order and in view, by being submitted to the legislature for revision at very short periods. English law reformers are contending more for a shadow than for the substance, who are not satisfied with this. Bacon expressly declares, that he does not mean to enter on the general question, whether text law, meaning thereby the articulate propositions of a statutory enactment, is or is not the most advantageous form of legislation. " It is too long a business to debate, whether *lex scripta, aut non scripta*, a text law, or customs well registered, with received and approved grounds and maxims, and acts and resolutions judicial from time to time, duly entered and reported, be the better form of declaring and authorizing laws." Neither codifiers nor anti-codifiers can pretend, therefore, that they have any colour for conjecturing even what was the opinion of Bacon as to the *general* question of code or no code. His argument, in its most universal form, is *particular*, and proceeds upon the dilemmas of a supposed complicated system. But two points are sufficiently clear with regard to the particular case of England. On the one hand, he held the new-moulding of the whole of its common law to be a perilous innovation; and, on the other hand, he contemplated a thorough reconstruction of its form. The method he proposed to employ for the " reducing and recompiling" of the common law, was the very method of a miscellaneous digest which has been lately recommended by Mr Wilson to the people of South Carolina. The difference between the two methods is a difference solely of arrangement. Bacon preferred an historical digest in order of time; Mr Wilson prefers a logical one according to the order of the subjects.

The late Mr Park objected that Bacon's plan, if applicable to the wants of the sixteenth century, was inapplicable to the wants of the nineteenth. The two grounds on which this notion is founded, are equally singular. First, it is surmised that the state of things which made a digest desirable in the age of Bacon, and even of Hale, no longer exists; namely, a want of books in which the law is exhibited with scientific coherence and development. The reign of James I. he observes, knew only of two abridgments, those of Brooke and Fitzherbert. He surely had forgotten the protests of Bacon, Coke, and Fleetwood, against abridgments, or he would not suppose that they were likely to set a high value on this department of our wealth. Only eleven treatises, he adds, were then to be found in a lawyer's library; whereas we have at least two hundred treatises at present, some of them by writers of the highest ability and learning; for instance, Fearne and Butler, Mr Preston and Sir Edward Sugden. The extent to which Bacon would have allowed this statement to be an answer to any part of his recommendation, supposing the works enumerated to be as good as possible, can be carried no farther than this: We may dispense with the composition by authority of auxiliary books, according to his third suggestion. That is all. The poverty of their legal literature, and the superfluity of ours, are considerations which, as far as they apply to the other suggestions—the only ones with which we are now concerned—aggravate the comparative necessity of a code at present. For, what was the real object which Bacon contemplated when he required that, in a system as complex as that of England, the whole law, as law, should be put under legislative sanction? He expresses it in the motto to the first title of his Aphorisms, "*de prima dignitate legum, ut sint certæ.*" This title was the only title that he finished; and, on summing up, he adds that he gave it *ad exemplum digesti reliqui quod meditamur.* Uncertainty, therefore, was in his eyes the great grievance to be removed, and by means of a digest from out of all laws. At the close of the reign of Elizabeth, he had previously declared, that "*the uncertainty of law is the principal and most just challenge that is made to the laws of our nation at this time.*" Can it be said that things are in this respect any better at present? and that it is to the number of its volunteer authors on this subject or on that, that the law of England is indebted for scientific development and coherence? In spite of its two hundred treatises, the uncertainty of the law, its inglorious uncertainty, still continues to be its reproach. In case of this being denied, we answer by the celebrated reply which Lord Eldon made to the representation of the bar, when they requested that he would not encumber his judgments by the declaration of so many doubts. Mr Park's second objection presumes, that a digest, if useful, practicable, and economical, when the reported cases lay in the compass of twenty-five volumes (their number when Bacon wrote), would be useless, impracticable, and ruinously costly, when they amount to somewhere about four hundred, as at present. The reader will judge for himself, whether Bacon would not on this very account have held that the want of a digest of the common law must be so much the more felt. The necessity for a digest of the reports, and for a digest of the statutes, depends on the same cause; and in both cases it must of course rise precisely in the same proportion with their voluminousness. The work, it is true, will require greater pains. The cost would be once only. Money advanced for a saving of time, of thought, and of error, is the best money that can be laid out. But this last objection, as it was already made in Bacon's time, is one which we can reject in his own words, "Sciences must lead books, not books sciences."

Half a century or thereabouts intervened between the propositions of Bacon and those of Hale. Burnet does not notice Hale's service during the commonwealth, on the parliamentary law commission. It had evidently been objected to him as an undue compliance with the times; but how falsely, is proved by his own account of his conduct as a commissioner. He verily believed, he says, owing to the very great earnestness of those who had gotten the power into their hands, "that anything which prudent and knowing men would have offered, might have been then passed for the reformation of things amiss in the law." This belief imposed a consequent obligation upon him. He was bound to endeavour to recover for the public similar advantages, as soon as the political reasons were removed, in consequence of which, according to his own narrative, he had been accessory to the obstructing of the law reforms in the promotion of which he was nominally engaged. Hale was remarkable for the moderation of his opinions, for the superstitious extent to which he reverenced prescriptive authority in government, and for the unrivalled mastery which he possessed over all the mysteries of legal learning. However, notwithstanding the apparent prevarication incident to the awkward position in which he was placed, he was thoroughly honest; and the language which he used after the restoration, proves that he felt the obligation which he had incurred. "The very name," he observes, "of reformation and of reformer has begun to be a style of contempt and obloquy, so that men are as fearful to be under the imputation of a reformer of the law, as they would of the name of knave or fool or hypocrite; on which account its sages dare not meddle with it, but let it live as long and as well as it can in the state they find it. Only, to save their credit upon such occasions, they meddle with some little inconsiderable things, as they set the price upon turnip and carrot seed; but nothing is dared to be done of use and importance." He proceeds to excuse the generation immediately preceding for having left all schemes of legal reformation untouched. But his excuse is coupled with a warning to his contemporaries and their successors. "The truth is, that for the last forty years, little hath been done of this kind: the times were tumultuous and not seasonable for it: and indeed there is the more need, by reason of that intermission and chasm, that somewhat of this kind should be done. Indeed it may justly be feared, that if *something considerable* for the reformation of things amiss in the law be not done by knowing and judicious persons, too much may some time or other be done by some, either out of envy at the professors, or mistaken apprehensions or humours." But little of this "something considerable" has been yet performed. In law reforms the authority of Hale in favour of really substantial changes is not and cannot be disputed. Our present question is, In the execution of his reforms, how far, and in what direction, would Hale have travelled towards a code? Are there sufficient means of learning? What he would *not* do, is abundantly evident, both by his *Considerations touching the Amendment of Law*, and by his preface to Rolle's *Abridgment.* He would have had nothing to do with anything tending to the alteration of the government; nothing that would change the foundation or integral principle of the law; nothing that, by depriving the common law of its particularity, fitted to almost all particular occasions, would have left it to rest in generals. On the other hand, he saw that it was the very nature of the body of the laws, as in the rolling of a snowball, to increase in bulk in every age, till it became utterly unmanageable. "Every age did retain somewhat of what was past, and somewhat of its own, and so carried over the whole product to the quotient. And this produceth mistakes. A man perchance useth one sort of conveyance, where he should have used another. It breeds uncertainty and contradiction of opinion, and that begets suits and expense. It must necessarily cause ignorance in the professors, and profession itself, because the volumes of the law are not easy to be mastered." From the unfinished state of the fragment which Mr Hargrave published, the whole extent and precise nature of the remedies here contemplated by Hale cannot be clearly ascertained; but Mr Hargrave adds in a note,[1] that there is on this subject another manuscript of Lord Hale, which contains "*a chapter on the books both of the statute and common law, with a view to the reduction and digest of them.*" To this extent, therefore, the advocates of a code, it seems, are warranted in appealing to the authority of Hale. It is just what we should have expected from a paragraph in the preface to Rolle, notwithstanding the attempt that has been made to narrow down its general scope to the single object expressed in the concluding words: "It were to be wished," he says, "that some complete *corpus communis juris* were to be extracted for the contracting of the laws into a narrower compass and method, at least for ordinary study." But that Hale had in view the use of the public in courts of justice, as well as that of students in a lecture-room or at a special pleader's chambers, is sufficiently clear by his reference, in the preceding paragraph, to the precedents of the compilation of the laws of Rome by Justinian, and of those of Wales by Edward I.

Latter times ought perhaps not to be harshly judged of for allowing a question, which Bacon and Hale had been unable to bring to any practical conclusion, to go quietly to sleep. At all events, it is no wonder that the law partook of the general incapacity by which the eighteenth century will be known in English history. It was one of those comfortable periods in which, wearied with excitement or satiated with food, mankind seems sunk in a dose, and indisposed to trouble itself with comprehensive views, or the exercise of original powers, or the engaging in vigorous enterprises. Of all departments, the law is that in which the spirit of routine has ordinarily and properly the most undisputed way. The repose was far too profound in England to be interrupted by the various experiments towards a code which, from one end of the Continent to the other, were receiving the patronage of almost every sovereign in Europe. Savigny dates from the year 1746 the continuous series of Prussian legislation. It began under Cocceii with the Code Frederic in 1750. This led on in 1780 to the compilation of the *Landrecht.* The *Landrecht* was promulgated in 1794, and appeared in a revised edition in 1803. The same authority assigns to 1753 the first germ of the new Austrian legislation. It passed through the ordeal of the reigns of Maria Teresa and of Joseph II. and finally issued in the present *Gesetzbuch,* which was promulgated in 1811. During all this time Russia was equally busy, manufacturing and remanufacturing the project which had been commenced as far back even as the time of the father of Peter the Great. The Empress Catherine imagined, or affected to imagine, that she could construct, by means of barbarous deputations from distant provinces, a national legislation. The Emperors Alexander and Nicholas have condescended to take up this splendid scheme as a part of their imperial inheritance. Nicholas, we learn, promises his subjects a new code as the fruits of his law commission (*Introduction by M. Dumont to the Principles of Codification,* 1828; *Annales de Legislation,* t. i. p. 290). The youthful philosopher of Naples was so much the dupe of the first volume of the legislative romance of a Russian code of perfect jurisprudence, as to predict, in 1785, that all the inhabitants of Europe might some day receive their laws *di questa sobria nazione. Il codice di Caterina* (he adds) *mi dà piu di pensare che la sua flotta spedita nell' Arcipelago.* In this foreign panegyric Filangieri had probably in view (as was usual with Voltaire on such occasions) an object nearer home. That object was to reproach his fellow-citizens for the opposition which had stifled the Codice Carolina of Tanucci. Tanucci had been obliged to content himself with a much more scanty reform than what he had wished to introduce. What he hoped that he had secured, is comprised in a decree *Del Raggionamento delle Sentenze,* published in 1774. The end contemplated by the decree was, as far as possible, to compel the old materials to do the office of a code. For this end it was ordered that all suits should be decided according to an express text of law; that, in case of any ambiguity in a particular text, the judges should interpret it in such a manner that the two premises of the judicial syllogism should be founded upon express laws; that, when the legal argument could not be so framed, or the law was altogether silent, the judges should apply to the supreme power of the state for assistance; that the authority of the doctors should be forthwith banished from the tribunals; and that every judge should publicly deliver in writing the grounds on which he founded his sentence. The argument published by Filangieri in defence of this decree, at the age of twenty-two,[2] is, all things considered, fully as remarkable a production as the *Science of Legislation* itself.

It is impossible to guess whether these continental proceedings would have ever attracted attention in England, but for the French revolution. The consequences of that event, and of the exciting discussions on every thing connected with law and politics which it provoked, were soon visible. It is true, that, for a time, reform was by most official persons, and by a great part of the public, considered as only another word for rebellion. But prejudices of this kind necessarily pass away with the alarm. Meanwhile the arguments and the appeals, the philosophy and the personalities, of Mr Bentham, began to attract the admiration of a very intelligent portion of his country, although as yet inconsiderable in point of numbers. They convinced some, and familiarised all, to views on legislation of a much bolder and more original character than had hitherto ever been presented by an English writer to the English public. It was not till 1817 that his papers on codification were first published. Within a year or two afterwards, they were themselves codified into French by M. Dumont. The principles had been sufficiently declared in his earlier works. It was not Mr Bentham's fault that the world received from him principles only. He offered his services as a codifier to America, Russia, Spain, and Portugal, in succession. But, in consequence of his specific offers having been declined, there is extant no plan of a regular code prepared by him, but what is far too general to be of much use beyond the purposes of an outline. Of all Mr Bentham's professional disciples, the only one who has come forward with direct propositions and specimens, is the late Mr Humphreys. In applying himself to the law of real property, and in undertaking to ground it anew on the three titles of enjoyment, transmission, and liability, he at once tried his strength with the most difficult problem in the whole English system. The approbation expressed in the *Edinburgh Review* by Sir Samuel Romilly, of Mr Bentham's general views on codification, and the favourable opinion expressed in the *Quarterly Review* by Mr Butler, of the more special measures of Mr Humphreys, compose, in point of professional authority, as strong a presumption, as practical men can ever expect to have, in behalf of any theory seeking to be put upon its trial. The ablest papers on the question will be found in the several numbers of the *Jurist.* Mr Hammond has laboured only in the comparatively narrow field of statutory consolidation; for instance, on the masses of criminal law contained under the heads of forgery and game laws. Indeed the censure on written laws, which he has prefixed to Sir David Evans's collection of the statutes, is so sweeping in

---

[2] Filangieri, t. v. p. 346.

Legislation.

its principle, that he can scarcely be reckoned amongst the advocates of statutory enactment, much less amongst the advocates of codes. Mr Uniacke, on more than one occasion, has recommended an entire redaction of the law, after the manner of Domat; and, with the assistance of Mr Harrison, he has gone so far as to lay before the public one or two specimens of his method, for example, the chapter of evidence. Mr Twiss appears to have adopted, as he certainly enforced, in his *Enquiry into the means of consolidating and digesting the Laws of England*, that part of Mr Uniacke's views which relates to the correction of the very defective mode, both in arrangement and phraseology, in which the common law and the statute law have hitherto expressed their respective rules. However, suppose Mr Twiss to have to this extent lighted his taper at his predecessor's candle, what does the illumination amount to? Merely to the suggesting, first, that, on digesting the common law, the leading principles and general rules on each subject must be extracted and laid down, with their reasons and diversities; next, that, wherever it can conveniently be done, the general rule should comprise the particular cases which it affects; but, where that cannot be attained, the particular cases should be placed in supplemental sentences. A similar course is recommended for adoption on consolidating the statute law. Instead of throwing all the particular cases into one integral and necessarily involved rule, the general rule ought to be extracted in a clear phrase by itself, and then a subsequent enumeration of the cases which fall under it should be adjoined. These suggestions are such as Mr Symonds would admit to be very reasonable. There is nothing in them, however, so ingenious or characteristic as to make them the peculiar property of any individual as their inventor. An inconceivable irritability seems to attach to almost all writers who have meddled with the subject, whether as friends or as foes. Otherwise, Mr Uniacke might have expected to accept gratefully a more lucid and elegant exposition of his argument than he had given to it himself. Mr Twiss expressly disclaimed any pretence to original invention. His particular object was simply to present the respective measures which better authorities had recommended, in such a consecutive order and relation, that each would be complete and available in itself, independently of those others which might or might not be executed after it. This he has done in a business-like sketch of the scheme by which it might be best managed; and, next, by pointing out what would be a proper constitution of the body which was to be intrusted with the work. The present law-commission may probably think that their own body is as well constituted for the purpose, as either the body proposed by Lord Stanhope in 1816, or the one proposed by Mr Twiss in 1826. Nevertheless, it may be well worth their considering whether it would not be advisable, in the execution of their task, to proceed step by step; securing, first the classification, next the consolidation, and lastly the re-enactment of the statutes previously consolidated; and, secondly, proceeding, first to the classification of the unenacted law, then to the digesting this with the former, and lastly to the imposing the legislative authentication upon the whole. In this manner, let the work proceed fast or slow, stop in the middle, or advance to its termination, every movement must tell, and not an iota of the labour so expended will be thrown away. We cannot dismiss this catalogue of names without expressing our respect for the zeal and foresight of the private lawyers, who, notwithstanding public indifference and public obloquy, have not feared to anticipate their age, and sow the seeds of a harvest which posterity will reap.

In England nobody has taken a part in this discussion who has not admitted in the most unqualified manner the absolute necessity of very considerable amendments in the English law. To the legislative alteration of certain defective principles the late Mr Park was ready to consent: further, however, he could not go. Acknowledging the evil of our judicial literature, and its inevitable tendency to become worse and worse, he could not bring himself to adopt any of the means by which codifiers seek to counteract it. Mr Cooper does not merely allow, he insists that a great deal has to be done.[1] Nor would he stop with Mr Park. We see no reason for supposing that he would keep out of the crucible of reform, as needing no amendment, a larger portion of the common law, than the most determined codifier also might exclude. His quarrel with the codifier begins with the further question, What are the most appropriate measures by which these necessary amendments should be effected? On this point, however, we have nothing more definite from Mr Cooper or from Mr Park than their contemptuous repudiation of a code. They have not divulged their secret, nor breathed a syllable, enabling us to judge of the character and efficiency of the reformatory measures which they propose to be substituted instead. In case no other measures are devised, or none which are adequate, what alternative remains for the English nation? We have to choose between the state of the law as it exists before the code, and the state of the law as it will exist after it, according to the best opinion we can form of an untried future. In other words, we have to choose between the suffering from the actual disorder, and the suffering from the proposed operation. Competent persons differ in opinion, which way the balance inclines at the present moment. It is certain, however, that a burden is daily accumulating in the scale which represents our actual system; a burden heavier than our fathers have borne before us, and heavier than we or than our children can ever bear. The crisis in the legal history of England, foreseen by Mr Hallam, "when our laws, like those of Rome, must be cast into the crucible," is at hand. It is a responsibility which her statesmen and her lawyers may well be excused for regarding with apprehension; but it is one for which, when it can no longer be safely avoided, it is their duty honestly to prepare. The important questions are, Is the time arrived? Are we equal to the occasion? How should it be done?

The objections mooted by Mr Cooper and by Mr Park range at a wider distance. Agreeing with the partisans of codes on the nature of the present evils, they persist nevertheless in declining to entertain the question of a code. This appears, therefore, to be the proper place for shortly stating the grounds of their respective objections. They have paid considerable attention to the subject, and have written upon it with much of learning, and still more of warmth. Their writings, however, do not, if we properly understand them, contain the proportion of well-directed and determinate reasoning which an argument of this magnitude demands. Mr Cooper can scarcely expect that persons reading for information would be satisfied by general assertions of the following description. A code will plunge us in uncertainties; it will multiply litigation; it will lower the price of land; it will put us back to the condition of an infant people. Codes, instead of being called for by the people at large, or instead of having been the result of free national legislation, have been almost always the gifts of despotic princes; codes are not wanted since the multiplication of the copies of law-books at a reasonable price by means of printing; parliament could never induce the best men to abandon the more profitable employment of the bench and of the bar, in order to take their intellectual share in so very precarious an adventure, &c. These are dogmatisms, which, we candidly confess, go with us for very little; yet, we hope, for all that they are really worth. But some of Mr Cooper's letters contain a great deal of very valuable instruction. We allude to the parts where he endeavours to distinguish between the actual condition of law and society in England and that of other countries, for the purpose of showing what may be the comparative exigency for, and what the probable efficiency of, an English code; again, when he points out the imperfections of the principal codes which have hitherto been devised; but, above all, in his endeavours to reduce within reasonable bounds the extravagant representations of what any code can possibly effect towards restraining law-books and lawsuits in an intelligent and flourishing society. Law reformers are not a kind of people to be charmed or intimidated by declamation. Nevertheless, all whom he can have intended to address would have been thankful for a complete and correct analysis of the advantages and disadvantages, in general, of legislating by way of codes, as compared with other systems of legislation. They would attentively listen to an historical statement of the advantages and disadvantages which had been practically experienced by particular countries on the adoption of codes. They are also fully aware of the use of judicious prospective calculations. If a similar balance-sheet, adapted to the case of England, had been thoughtfully prepared for them, they would have carefully studied its probable results, before permitting the experiment to be tried upon the existing elements of English law, and in the atmosphere which surrounds it. Towards this, Mr Cooper has done something; and so far he has done wisely and well.

---

[1] *Lettres sur la Cour de la Chancellerie*, 1830, Appendix, p. 382.

Mr Park, in his *Contreprojêt to the Humphreysian Code, and to the projects of Redaction of Messrs Hammond, Uniacke, and Twiss*, took up a position of his own. His circle appears a wide one; but it is in fact almost a single point. He abstains from entering into the general discussion for or against codes. He has been informed that Savigny had settled the general question in the negative. The province to which he confines himself, is that of showing that, whatever may become of the argument in other countries, the law of England is a law of precedents, dependent upon established maxims and rules of adjudication, and framed upon some peculiar principle of its own. He calls it the principle of systematic coherence and dialectic deduceableness. To this character he conceives codes or redactions must be alike fatal; for they must equally (as he opines) withdraw the law as a science from the mastery of its practitioners, and introduce a corresponding uncertainty into the decision of its judges. We fully admit the judicial origin of the greater part of the English law in times past. We even believe that the most important hints, and perhaps the most important materials of law and legislation, must continue for the future also to come out of courts of justice. Yet the question recurs, What possible good can the public derive from the above theory of assumed coherent principles, which the public cannot equally possess when the actually existing law is transferred into a code? Mr Tyrrell observes, that a considerable shaking of precedents must occur when principles are taken up and separated from their context. We agree, that upon transplanting maxims, a little time will be wanted before they take root kindly in the new soil prepared for them. But that is all. Besides this temporary annoyance is different, in different systems. In some, a single thread cannot be loosened but the whole web is ravelled up at once. In others, the system has grown up piecemeal and in the dark: it has started originally from no more comprehensive principle than the circumstances of the moment: it has spread by individual accretion only: it is kept together by cohesion rather than coherence. In this case, whatever principles and rules are hammered out at last, or rise up under the moulding influence of time, they exist there in so arbitrary and conventional a state, that the percentage of temporary inconvenience which may accompany their removal to a more favourable position must be cheaply purchased. If there are no principles and rules to be discovered, whatever precautions may be taken in dealing with a mere chaos of nominal authorities, is tenderness misplaced. But granting them to be in existence and in operation, it is impossible to believe that they cannot do their work as effectually in a code, as whilst they are scattered up and down in the floating repository of voluminous reports. Of the two presumptions, which is the more probable,—that the qualities of systematic coherency and dialectic deduceableness will be the natural accompaniments of a system which branches out from sound general principles, however originally derived, into plain didactic regulations? or that they will be the artificial consequences of a fictitious system, built upon an interminable series of specialties, called precedents; especially when it is considered that the very element of case-law involves so many points of variation, that, on any occasion, nobody can be sure that he is not exercising his logic upon a different set of precedents, or upon those specialties in the self-same precedent, which, after all, the judge may not consider as properly applicable to the case? There are embodied in almost every precedent, opposite analogies, with sundry hanging threads attached to them, any one of which a judge, who is a little capricious, may lay hold of at his pleasure.

In regard to the English system, Mr Park considered himself unquestionably safe upon ninety-five per cent. of the advice which he gave his clients. Mr Preston informed him, that upon an inspection of his opinion-books for thirty-three years, an average of not above three per cent. went on to judicial litigation. Here, exclaims Mr Park, are 33,000 cases intercepted in their course towards the tribunals. Now, we know why it is that codified France requires 5000 judges. Before any such use, to the disadvantage of the Code Napoleon, can be made of this closet-calculation, we must have before us the average of error and litigation incident to the consultations of French lawyers of equal eminence. Mr Park appears to imagine that there are no cases disposed of in this quiet way under codes, and that the French tribunals are all occupied in dispatching what English practice would have anticipated out of court. In trying the merits of the question—code or no code—by experiment, the judicial systems for the administration of each must be taken to be equally good; and the code must be something steadier than "a heaving ocean of jurisprudential ethics?" If it be answered, that the supposition of this inferiority in the judges and in the code is a part of the case, there is no use in continuing the discussion, except to say that the supposition is a pure assumption. It is one, too, as little warranted by fact or probability, as the opposite theory of Mr Bentham, whose delight it was to anticipate the golden age, when codification should have deprived opinionists of their bread. The statistics of litigation in different countries have as yet been far too imperfectly observed, to allow of our forming even a guess as to what would be the result, in this respect, of a comparison between France and England. We have no reason to believe that the return would be unfavourable to the working of the Code Napoleon. But the advocates of codification in general, still less of English codification, are not bound to put their case on the issue of any single comparison. The case of England is too peculiar to be governed by the success or failure of any of the codes of modern Europe. The peculiarities, as they are acknowledged to prevail up to our own times, are sufficiently striking. The testimony of Mr Park's favourite authority, Mr Preston, is decisive upon a subject, too, which, above all others, has exercised and exhausted for ages the learning of the English bar: although it seems, nevertheless, that it had been little studied as a science. "Till a recent period, the knowledge of this branch of the law (that of real property) had received a very moderate share of attention as a science. The rules of property were scattered in books on the subject of the laws in general...The knowledge of these rules was not to be acquired with ease. Much perplexity and confusion must have been experienced by the student, who, out of many disagreeing opinions equally specious, was to collect the one best supported by principles; on whom it was incumbent, from a number of particular cases, to propose to himself, or to extract, a general rule, and to mark the cases which were not within the reason or the scope of the rule. This was to be accomplished only by discriminating the very minute circumstances, by which cases within the reason of the rule were to be distinguished from those cases which were beyond or beside that reason." If this were the case, till very recently, with the most elaborate and systematic part of the law, assuredly the doubt which sensible persons will entertain, is not so much, whether a code upon this portion of the law were wanting, as whether this particular portion were in a state ripe enough to be incorporated into a code. It is trifling with men, after a statement of this description, to tell them that the uncertainty is not in the law, but in the method of discovering it; that method being the only one you have. When a precedent is overruled, how is a suitor the better off for being told by Blackstone that there has been no change in the law; but that all that has taken place is, that an imposition has been unmasked, and a certain amount of supposititious law displaced to make way for the rightful interpretation. The law is a practical science. What can be that marvellous perfection which is consistent with being obscure, unmanageable, and inaccessible? What would be said of a musical instrument, which, from its size and complication, required a Polyphemus to play upon it? In law, as in morals, there must be a mistake somewhere, when what is called the theory is one thing, whilst the practice turns out to be something else. The desire of anticipating every possible exercise of discretion, through the instrumentality of refinements and subtleties, and by means of an enormous magazine of case-law, only opens the door to discretions of another class. We have admitted that there is a certain inconvenience attending the most necessary changes. On constructing a code, a short intermediate period must elapse before it settles, as builders say. During this interval, however, it is some compensation, that, even from the first, the decisions will keep closer and closer to the merits; and that, according as the doubtful points become gradually fixed, they will be fixed on foundations which will not fail us. But Mr Preston says, that the law of real property has latterly acquired the character of a science. Let us take his single treatise on Merger. Its author calls it elementary. But it is considered as one of the most profound books in an English law library; and one must hope, for the sake of the English community, whether clients, practitioners, or students, that it is justly considered so (or what is to become of them under such a system of jurisprudence?) when we are told by its author that the volume "contains at least 3000 propositions on subjects of every day's occurrence." Whoever may be called upon to codify the law of Merger, will owe much to Mr Preston. Books of this class represent at the present day the writings of the jurists of the third century under the Roman law. They must at last have to be put to the same honourable use. Their authors are our Ulpians and Papinians, preparing the way for the Tribonian who is to come. Mr Hallam has said, that it will be a disgrace to the nineteenth century if it should not produce one. We pray, then, for better things.

Does England mean, as the master and the maker of English law, to fall back into the wake of the United States? If not, we may have no great time to lose. We have already shown how far New York and South Carolina are in advance. But the division of opinion upon this point, which exists in some quarters amongst our transatlantic coparceners in the common law, as well as amongst ourselves, seems with them to be more entirely a question of time, and not of principle, than is yet the case in England. In the meanwhile, the turn which it has taken there, appears to be both rapid and singular. It was only the other day that Mr Madison scarcely thought the offer of a code from Mr Bentham worth the trouble of acknowledging. The common law was a thing too sacred and tender to be touched. But that delicacy is over. Law, framed as the common law has been framed, will want reforming at some time. The only doubt is, whether lawyers of the years of our Lord 1823, 1836, are born too late or too early for the Herculean task. Mr Sampson has great merit for having taken the lead in disabusing his countrymen of their blind idolatry of the common law. He proposed, in his discourse of 1823, an immediate revision of it. His view would seem to be, that nothing is to be got by waiting till it gets worse. On the other hand, Mr Duponceau, in his *Dissertation on the Nature and Extent of the Jurisdiction of the Courts of the United States*, only begged of reformers, the year afterwards, to have a little patience. If they refrained a little longer, the judges would have substituted for the still remaining errors of these old Sybilline books more solid principles of jurisprudence, and we should have a common law worth codifying. "It is much better that things should remain as they are until the common law shall, by successive improvements, have attained its highest degree of perfection, and then it will be time to reduce its principal provisions to a text; for the details must always be left to the sound application of the principles of the system, as it is impossible for any legislator to foresee all the cases that may possibly arise. I think, however, that we are sufficiently ripe for a national system of *commercial law*, and therefore I have ventured to express a hope, that congress will exercise the powers which the constitution has given them upon that subject." The particular question of time was submitted in 1826 to Mr Dupin. His answer, although diffident in form, is positive enough in substance. "As to the precise point of whether your country is ripe for such a digest, I do not undertake to decide it. I confess that, if our codes had been digested in the fifteenth, or even in the sixteenth century, they would not have possessed by any means the qualities which now recommend them. To produce them, it was necessary that the labours of jurists, the decisions of magistrates, and the experience of all classes, should have brought the science, as it were, to a certainty. Are you yet arrived at this point? You can answer this better than I can. I admit the force of the reason given by some of your adversaries, that a badly made law would tie up the judges, and prevent them from improving the system by degrees. But what are these improvements which they suppose must result from the liberality and the wisdom of the judges, but the exercise of arbitrary power? And is not this attended with most serious inconveniences? Bacon has well said, *optima lex est quæ minimum relinquit arbitrio judicis, optimus judex qui minimum sibi*. And yet there are persons in your country who would wish the judges in reality to be legislators. Can your nation, so enlightened in matters of politics and government, be only in arrear in matters of civil and criminal law?" Under these circumstances, the scruples of Mr Duponceau and his friends may perhaps be already overcome; for he has declared that he thinks "the common law is susceptible of being carried to the highest degree of perfection, and that he believes the honour of producing the result is reserved to the jurists of the United States." It is impossible, therefore, to tell with what rapidity this process may be taking place, and when the propitious hour may happen to arrive. English jurists have nothing to wait for on either of these opposite suppositions. On the argument of Mr Sampson, they ought not merely to be content, but to make good speed with their actual materials for legislation. The rubbish gets deeper and deeper every year. According to the expectation of Mr Duponceau, they have nothing to stay for. The promised contributions to the perfection of our old vernacular jurisprudence are not to come from us. Unless, therefore, we mean to wait for the American Tribonian, we should do well, without more delay, to set about providing ourselves with a Tribonian of our own.

Mr Justice Story, in his *Discourse on the Past History, Present State, and Future Prospects of the Law*, delivered about the same period, looks on the mother country more favourably. He admits her into partnership in this heroic work. We cannot, therefore, do less than quote his advice. "The mass of the law is accumulating with an almost incredible rapidity, and with this accumulation the labour of the students, as well as professors, is seriously augmenting. It is impossible not to look without some discouragement upon the ponderous volumes which the next half century will add to the groaning shelves of our jurists. The habits of generalization which will be acquired and perfected by the liberal studies which I have ventured to recommend, will do something to avert the fearful calamity which threatens us, of being buried alive, not in the catacombs, but in the labyrinths of the law. I know, indeed, but of one adequate remedy, and that is, *by a gradual digest, under legislative authority, of those portions of our jurisprudence which, under the forming hand of the judiciary, shall from time to time acquire scientific accuracy*. By thus reducing to a text the exact principles of the law, we shall, in a great measure, get rid of the necessity of appealing to volumes which contain jarring and discordant opinions; and thus we may pave the way to a general code, which will present, in its positive and authoritative text, the most material rules to guide the lawyer, the statesman, and the private citizen. It is obvious that such a digest can apply only to the law, as it has been applied to human concerns in past times; but, by revision at distant[1] periods, it may be made to reflect all the light which intermediate decisions may have thrown upon our jurisprudence. To attempt more than this, would be a hopeless labour, if not an absurd project. We ought not to permit ourselves to indulge in the theoretical extravagancies of some well-meaning philosophical jurists, who believe that all human concerns for the future can be provided for in a code speaking a definite language. Sufficient for us will be the achievement to reduce the past to order and certainty; and that this is within our reach cannot be matter of doubtful speculation. It has been already accomplished, in a manner so triumphant that no cavil has been able to lessen the fame of the authors. The Pandects of Justinian, imperfect as they are, from the haste in which they were compiled, are a monument of imperishable glory to the wisdom of the age; and they gave to Rome, and to the civilized world, a system of civil maxims which have not been excelled in usefulness and equity. They superseded at once the immense collections of former times, and left them to perish in oblivion; so that, of all ante-Justinianian jurisprudence, little more remains than a few fragments, which are now and then recovered from the dust and rubbish of antiquity, in the *codices rescripti* of some venerable libraries. The modern code of France, embracing as it does the entire elements of her jurisprudence, in the rights, duties, relations, and obligations of civil life; the exposition of the rules of contracts of every sort, including commercial contracts; the descent, distribution, and regulation of property; the definition and punishment of crimes; the ordinary and extraordinary police of the country, and the enumeration of the whole detail of the civil and criminal practice and process; is perhaps the most finished and methodical treatise of law that the world ever saw. This code forms also the law of Holland, and, with comparatively few alterations, has been solemnly adopted as its fundamental law by the state of Louisiana. The materials of it were to be sought for among an almost infinite variety of provincial usages and customary laws, and were far more difficult to reduce into system, than any which belong to the common law. It is left to the future jurists of our country and England to accomplish for the common law what has thus been so successfully demonstrated to be a practical problem in the jurisprudence of other nations, a task which the modest but wonderful genius of Sir William Jones did not scruple to believe to be within the reach of a single mind successfully to accomplish."

Marvellous pains are taken, and with marvellous success, to make people misunderstand each other, to exaggerate the importance of the minor points upon which they differ, and to slur over or forget the far greater matters on which they are agreed. From the way in which Mr Bentham's adversaries represent or rather misrepresent his opinions, their readers would not suspect him to have stated that there are three stages of legislation, of which it is the last which will terminate in a code. This view, or something extremely like it, is also that entertained by Savigny. In the muster-roll of names, it is repeatedly mentioned, that Thibaut, Feuerbach, Pfeiffer, Almendigin, Gonner, and others, have written in favour of codification; Schlosser, Hugo Schrader, and others, against it. We have had no opportunity of seeing the particular works alluded to. But we comfort ourselves in our ignorance of the fact, by the probability that the real bearing of their debate is confined to Germany; since this is true, even in the instance of Savigny's celebrated essay upon *The Vocation of our Age for Legislation and Jurisprudence.* His very title significantly fixes the object of the work. It is addressed to the present age. This ought to have been enough to put honest readers upon their guard against drawing conclusions beyond the intention of the author. On reading it, it is plain that his general observations have a positive and limited reference, as much as his special criticisms. By no possibility can they be reasonably applied to any country but to one which is placed by its political circumstances, by the character of its laws, and even by the state of its language, as well as of its legal attainments, in the particular predicament which the whole of his argument assumes. M. Meyer has inscribed to Mr Cooper a very able essay, which we have cited before for another purpose. We agree with him in the greater part of the opinions which he has expressed, and altogether in the conclusions in favour of codification at which he has arrived. But in criticising Savigny, he appears to us, in attacking him, to have mistaken occasionally the extent of this admirable scholar's argument, equally almost with the English writers, who, without discriminating very accurately their right to claim it, have sought for shelter under his name. Savigny's essay, at the time it was published, was a political pamphlet against the French. Prussia had just cleared her soil of their bayonets, and her tribunals of their laws. Körner's songs are not more the burst of triumph from a soldier at their military emancipation, than Savigny's pages are the exulting gratulations of an enthusiastic lawyer on the recovery of his country's legal freedom. The work did and does infinite credit to his patriotism. His statements, too, according to our understanding of them, we can have no difficulty in taking upon his own authority. The inaptitude of Prussian lawyers to legislate for themselves at present may be true to the letter. Trained up under the minutiæ of the *landrecht*, it is natural to expect that this should be the case. Meyer ought to have borne these circumstances in mind; in which case, he would have made more allowance for the local and temporary spirit in which the argument of the Prussian jurist is not only conceived, but actually expressed. There are, however, essential differences in the legal principles and the habits of these two writers, and in their general drift of thought. Savigny is an ardent advocate of the historical school of law; Meyer of the pragmatic. Savigny looks to the traditions from which laws are derived; Meyer to the express sanction by which they are imposed. But when Meyer says, that if the system of the historical school be well founded, not only are written codes and positive legislations chimeras and impossibilities, but every attempt to arrive at them must lead to serious inconveniences, and adds, that Savigny thinks so too,—the observation is much too sweepingly worded. With the exception of a few bitter sneers at France, Savigny argues the case of Germany only. The single point he makes, is its incapacity at present to frame a code of any real merit, owing to the defective education of its lawyers, and the insufficiency of its language. His objection includes every species of legislation and jurisprudence; and only specifies codes in particular, because they are more prominent and arduous than the rest. Instead of saying that a good code is universally impracticable, he says just the contrary. Nay, he goes the length of saying, that by means of historical law-schools, well conducted, Germany itself will become qualified to frame one. But whether it would be prudent or not to do so; in other words, which system would be preferable, that of enacted or unenacted laws; is a further point on which, like Bacon, he abstains from intimating an opinion. It is no imputation on Savigny to state that the essay was written under great political excitement, and with the professed object of beating up a crusade against denationalization. Under these circumstances, we feel that it is not presumptuous to surmise, that if he could have honestly pronounced an opinion universally unfavourable to the adoption of a code, he would not have withheld it.

---

[1] Bacon says *short.*

The following are the passages in which Savigny contemplates the euthanasia of the historical school. The first regards the substance of the law, as it will have been created by legal talent: "Let jurisprudence be once generally diffused amongst the jurists, in the manner above mentioned, and we again possess, in the legal profession, a subject for living customary law, consequently for real improvement; the practice of our courts of justice is but a clumsy substitute for this customary law, the practice of the law-faculties the clumsiest of all. The historical matter of law, which now hems us in on all sides, will then be brought under subjection, and constitute our wealth. We shall then possess a truly national law, and a powerful expressive language will not be wanting to it. We may then give up the Roman law to history, and we shall have, not merely a feeble imitation of the Roman system, but a truly national and new system of our own. We shall have reached somewhat higher than to a merely sure and speedy administration of justice; that state of clear perceptiveness which is ordinarily peculiar to the law of young nations, will be combined with the height of scientific development. Then, too, may future degenerate times be provided for, and then will be the time for considering whether this be done best by codes or in another form. I do not say that this state of things will ever arrive; this depends upon the combination of the rarest and most fortunate circumstances. What we jurists can contribute towards it, is an openness to conviction, and honest hearty co-operation." The following passage regards the language in which this substance is supposed to be enshrined and communicated: "It has frequently been required that the code should be popular; and Thibaut also once refers to the demand. Properly understood, this demand may be complied with. For language, the most effective medium by which a communication of mind can take place, also checks and limits this mental intercourse in many ways. The best part of thought is frequently absorbed by this medium, in consequence of the incapacity either of the speaker or the hearer. But, by natural ability or art, this medium may be brought under such command, that neither sort of incapacity is any longer an obstacle. The thought passes over the varying characters and capacities of the listeners, and hits them in the common intellectual centre point. Then is it that the high are satisfied, whilst all is clear even to the low; both see the thought above them, in an elevated improving point of view; and it is within the reach of both. Thus, there was somewhere a miraculous image of Christ, which had the property of being a hand's breadth taller than the tallest man who might place himself beside it; were it a man of moderate size, or a little man, that came, the difference was still the same, never greater. This simple, truly popular style, is to be seen (to speak only of our native literature) in our better sort of chronicles, but it may also appear in many other forms. Should we once regain it, many an excellent thing will be possible; amongst others, a good historical style, and, amongst others, a popular code." Savigny plainly states the real grounds of his objections to be, not to a code *qua* code, but to a code made by the present contemporary generation, in consequence of their incompetency. "Thibaut sees the cause of the evil in the sources of the law, and believes that they could remedy it by a code. I, on the other hand, find it in ourselves, and believe, for this very reason, that we are not qualified to frame one." The conditions which he requires for the purposes of composing a good system of law in any shape, are, according to his account, all wanting in Prussia. The first condition is unity of system. "To begin with the least important particular, let any man run over in his mind a number of the jurists now living, and ask himself, whether the existing law could be so much as systematized by their combined labours; he would soon be convinced of the utter impossibility. But that a code is a much greater work, and that a higher degree of organic unity must be required of it, is what no one will deny. In reality, therefore, the code, if it is not to be a mere lifeless, mechanical, and, consequently, worthless composition, could not be framed by such a committee, but only by an individual: the others would only be able to afford a subordinate description of aid, by communicating their advice and opinions on the occurrence of particular doubts, or by exerting themselves to purify the work when completed, by the detection of individual defects. But whoever admits this, must, as regards the present age, despair of the practicability of the proposal; for, to find that same individual the true lawgiver, is perfectly impossible, because, by reason of the heterogeneous character of the modes of thought and knowledge of our jurists, no individual can be treated as the representative of the species." The next condition is, that laws, properly grounded and combined, must consist of leading axioms.

“To distinguish these, and deduce from them the internal connection and the precise degree of affinity which subsist between all juridical notions and rules, is amongst the most difficult of the problems of jurisprudence. Indeed, it is peculiarly this which gives our labours the scientific character. If, then, the code be formed in a time which is unequal to this art, the following evils are inevitable. In the attempt at material completeness, particular decisions, unnoticed by the framers, will be constantly crossing and contradicting each other, which will gradually come to light by practice only, and, in the case of a bad administration of justice, not even by that. This result would be clearly inevitable, so far as contemporaries are concerned, were an age, without being fully qualified, to fix its legal notions by legislative authority in this manner; but the effect of it would be no less injurious to succeeding times.” The last condition provides for the form of laws, and for the art of exposition and of expression, whether it be brevity or diffuseness which the occasion may require. We have extracted and brought into juxtaposition the above passages, with two purposes in view.

The reader will now understand what are the precise qualities upon which Savigny considers the faculty of making good laws of every description to depend; there being no further particularity in the case of codes, but that the difficulty rises with the magnitude of the undertaking. On recapitulating the conditions, the reader must determine how far the English lawyer can comply with them. We cannot but think that the approximation is sufficiently close to encourage us in making the attempt. According to the degree that our conclusion is correct, England need not disclaim the vocation of her age to legislation and jurisprudence. To begin with the last condition, language; Latin was perhaps a better legislative language than even the Greek. French and Italian may have a similar pre-eminence in modern times. Yet there is no reason that we know of for believing that the vagueness of the English statute-book is attributable to the language, and not to the compilers of it. The next condition was a perception of the affinity between different juridical rules and notions. Notwithstanding the extent of the English law, and the consequent dangers hanging over it from day to day, its axioms, and what has been termed the science of legal judgment, have not yet escaped the grasp of the profession. In their talent for analogical reasoning, for seeing the proper legal relation in an individual case, and for an union of theory with practice, the existing English school resembles the Roman, as it existed at the best times of classical jurisprudence. It may be said equally of the great men of both, “Their theory and practice are the same; their theory is framed for immediate application, and their practice is uniformly ennobled by scientific treatment. They see in every principle a case of application, in every case the rule by which it is to be decided; and in the ease with which they pass from generals to particulars, and back again from particulars to generals, their mastery is undeniable.” But the resemblance between the two in the remaining condition is still more striking. “Amongst the Romans in Papinian's time, a code was possible, because their aggregate juridical literature constituted an organic whole. It might be said (to use an expression of the later jurists), that at that time the individual jurists were *fungible* persons. In such a state of things, indeed, there were many ways leading to a good code; one jurist might frame it, and the others afterwards supply particular defects; which was practicable, because each individual jurist was then entitled to rank as the representative of the juridical cultivation of the time; or several, independently of each other, might each work out the whole, and, by collating and combining their productions, a new one might be formed, more complete than each taken singly, but homogeneous with all.” On these grounds, taken from the tests of competency laid down by Savigny himself, we feel justified in submitting to his admirers, that a *prima facie* case at least is made out to this extent, viz. that the common law of England is capable, at the present moment, of being converted into a code.

It may be proper to remind all parties that England, on entering upon this labour, has two great advantages. They are advantages, in the degree to which she enjoys them, certainly peculiar to herself. The first is, the unity of her present system. She has no disturbing forces arising from permanent disparities of soil and of climate between different parts of her empire. She has no personal laws, the inheritance of races that refuse to amalgamate with each other. She has few conflicting customs representing cherished recollections, and wrought into the character of respective portions of her population. The early centralization of her judicial system has prevented all this. She is saved from those embarrassments which the appeal court of Montpelier so forcibly depictured in their criticism on the compromise enforced by the Code Napoleon, between the laws and usages of the *pays du droit écrit* and the *pays du droit coutumier*. These were the obstacles by which James I. was foiled in his darling project of an union between the laws of England and Scotland. He could not succeed, even with the comparatively simple and flexible principles of the criminal laws. What is to be done in a case like that of Canada, where the French and English settlers make it a point of national pride and national antipathy to cling the closer, each to their opposite systems of jurisprudence? Extensive variances of this description, whilst they constitute one of the great necessities for an uniform system of law throughout our Indian empire (if we mean to govern it by Europeans, and to govern it by law), also, on the other hand, constitute a great, though it is to be hoped not insuperable, difficulty in the execution of the task. It is unfortunate that, in this point of view, the practical difficulty of the task must always rise precisely in proportion to the abstract importance that it should be performed. Savigny would estimate very highly the advantage belonging to the unity in our materials; and he would be disposed to do this by the general policy of his historical creed. But all Prussians have been made sensible of it, from the tenderness with which Prussia has been compelled to humour her subjects on this very point. A government which, by breaking up the estates of its landowners, has invaded, and, in the course of a few years, overturned, the rights of private property; which has formed into codes at its pleasure the great body of its Germanized Roman law; and which had actually decreed that all provincial laws should be also turned into codes within three years; was nevertheless defeated here. They were unable to succeed in this last object, excepting in a single province, that of East Prussia; and they have since been compelled to suspend, if not abandon, their purpose in the rest.

The second advantage is scarcely an inferior one. If the remark of Sir James Mackintosh be correct, “that there is but one way of forming a civil code, either consistent with common sense, or that has ever been practised in any country, namely, that of gradually building up the law in proportion as the facts arise which it is to regulate,” too great value cannot be set on the quantity and quality of the judicial materials which the history of a nation may thus have collected in its course. It can be nothing but the intrinsic merit of the English reports which has extorted from Mr Bentham repeated panegyrics. “A library composed of the books in which these cases are thus brought to view,—such a library, even though there were not so much as a single *law* in it, is at any rate a rich storehouse of materials for legislation;

such a storehouse, that without it no tolerably adequate system of laws could be made. The more ample the stock, so that it be not to such a degree vast that the mind is lost in it, the more effectual the provision made for this most necessary and arduous of all intellectual works. The greatest quantity of wealth possessed in this shape by any other nation, is penury in comparison of that which has been furnished by English common law." In the immense mass to which the repertory of its adjudged cases extends, it has well acquitted itself of that preliminary process on which Leibnitz set so high a value. Speaking of the writers of consultations, he has said that they are "almost the only juridical writers who really extend jurisprudence, and enrich it by the observation of new cases." *In his autoribus laudibile est, quod novos emergentes casus perpetuæ memoriæ consignant, orbemque juridicum continuâ auctione locupletant, quod non faciunt autores exercitationum et commentatiorum semper vetera ruminantes.*"

There is an ancient prejudice which has been conceived against the law, both by men of the world and by men of learning. It is high time that the prejudice were removed. This would be done as soon as ever means were taken to do justice to the good sense, the close reasoning, and just principles, at present buried under its forms. The science, however, must be reconstructed by authority, before the points and peculiarities of the law can, by a proper analysis and synthesis, be so separated and combined as to clear away unsatisfactory anomalies, and present its rules in a way which will bear examination. When Lord Mansfield boasted that the English law was a law of principle, he at least saw the means of making it so. He had made it so for himself. When Hale called upon every student to methodize the law in his reading, telling him, that otherwise he could never carry it in his memory for seven years together, or a much shorter period, he could not have stopped by choice at the case of individual students. He must have been prepared to call upon the legislature to take the same course, for the sake of the profession who were to practise it, and the public who were to obey it. The advantage of whatever method or principle can be put into the law is one of those advantages which ought to be diffused as widely, and put forward as prominently, as possible. These two things are so nearly connected, that we must not expect to get the benefit of one without the other. By the help of method, the true principles are brought to light; and then, by a philosophical re-action, the principles do as much in return, or more, towards assisting us to improve our methods. The perfection of both terminates in a code. With this view, Bacon's collection of legal maxims appears to have been one of his most valuable works, though only a small portion of them has been preserved. He speaks of them as the *regulæ juris,* with their differences and limitations, warranted by good authorities, and set forth by discourse and deducement in a just tractate, "the thing most important to the health and good institution of laws." He had seen little in this kind either in our law or in that of others which satisfied him, but he was so well satisfied with the beginning which he had made himself, that he had the confidence to assure his majesty, "I am in good hope, that when Sir Edward Coke's reports, and my own rules and decisions, shall come to posterity, there will be (whatsoever is now thought) question who was the greater lawyer." It will be seen, when the English law is thus put into system, whether it can, equally with the Roman, deserve the commendation which Leibnitz bestowed upon the Roman, when he said of it, that he knew nothing so mathematical out of the mathematics.

The practical question upon which the estimate of a code, or, in other words, of enacted law, must depend, involves three distinct points. First, what are the evils inherent in unenacted law generally? next, what are those which are peculiar to the particular shape which unenacted law has assumed in England? These are matters of fact. There is a further question, how far the turning of unenacted into enacted law is likely to get rid of these evils. This must be comparatively a matter of opinion. These points have been anticipated more or less in our historical narrative. The inquirer is referred for a more particular detail to Mr Bentham's papers on Codification, and to the comment on them by Sir Samuel Romilly in the fifty-seventh number of the *Edinburgh Review.* He will find there what is the nature of the unknown God from whose worship it is one of the principal objects of a code to set him free. These evils are reduced in malignity under the English system, and, to a considerable degree, are kept out of public sight, from the manner in which common law and statute law are there mixed up together. Otherwise a system of barefaced judge-made law, and nothing else, would not be tolerated for a day. It is true that laws, however constituted, cannot sustain the character of a people, when, from more powerful independent causes, the national character is falling into decay. It is true also that such a people will pull down their laws with them. Still it is a presumption against the possible stability and firmness of unenacted law, that all the admitted excellence of the expositions of the Roman jurisconsults of the third century could not prevent the civil law from getting into such a state of anarchy, that a code, put together by very inferior workmen, was acknowledged, universally, of two evils to have become the least.

There is a proverbial saying, by which law is denominated a necessary evil. The expression assumes, and assumes truly, that there are evils inseparable from law. Amongst these, are particular consequences, which it has been sometimes absurdly expected, or disingenuously represented, that codification would remove. We must mention a few of those which wise reformers never held, and which ignorant ones must instantly give up. The first of these fallacies, and almost the most absurd, is the imagination of such a thing as an immutable code. There is no such combination as "man and for ever." We must leave to pretenders, playing at legislation, like Frederick the Great or the Empress Catherine, the fiction that a code may be a manual as cheap, short, and familiar, as a catechism; and that its immediate consequence will be the enabling the world to dispense with lawyers as a distinct profession. Instead of doing away with judges and lawyers, professionally educated, the effect of a good system must be quite the reverse. It is among the merits of a code properly made and properly studied, that it will want lawyers of a higher order, and that it will help to make them. The notion of doing without the profession of the law belongs to the region of the legal debates during the Commonwealth, in one of which it was seriously moved to burn the records. The unlearned member was of course proceeding upon Knox's principle in ecclesiastical reform, viz. to displace the rooks by pulling down the rookeries. Hale had some trouble to bring the fanatics to reason. If the notion of simplifying the interpretation of a code by destroying the old authorities be absurd on one hand, equally so is the opposite notion, that the neglect of them will be the necessary consequence of a code. It is nothing to the discredit of the reforms by Justinian (quite the contrary) to admit that, in case he had been succeeded by enlightened times, the *Jurisprudentia ante-Justinianea* would not have been suffered to fall into oblivion. Is the question a different one with regard to the contributions of contemporary legal learning? Not at all. Yet the government of Bavaria was insane enough, in publishing its new penal code in 1813, to follow it up by an ordinance that no public servant or lawyer should print a commentary upon it. It was the plain consequence of such an order, as far as government was concerned, to abolish law as a science, to deprive it of all capability of improvement, and to perpetuate every existing blunder. The most appropriate and righteous censure which could be passed upon such folly, was the necessity which they had to submit to, of stultifying themselves by being obliged to add to this perfect work above one hundred *novels* within the four succeeding years. An attempt to repress what the French call the *Jurisprudence des Arrêts*, by discouraging the preservation and the study of judicial decisions, under the alarm of being overwhelmed by them, is even still more prejudicial. For this is to dry up at its source the natural fountain, whose tributary waters, if duly analysed and conducted, are, from among many subsidiary means, the best qualified of all for supplying the code from time to time with whatever accessions it may require, and for maintaining it on a proper level with the wants and the intelligence of society. It shows the incorrigibleness of mankind, that most of these modern errors are only repetitions of the very errors which were committed by Tribonian.

The sooner all delusive hopes are laid aside the better. We are spared disappointment in quarters where nothing but disappointment is to be met with; and by concentrating our efforts in the right direction, upon objects within our reach, all that is attainable is more likely to be attained. How far is it possible to reduce the causes of litigation by giving to the law what Bentham has chosen to term *cognoscibility?* Every possible facility to litigation, wherever rights given to a party by the law are violated or withheld, is one of the most obvious, though one of the most neglected, duties of society. On the other hand, that it is extremely desirable, and also to a certain extent practicable, to reduce the causes of litigation, which arise from the uncertainty of the law, nobody can deny. But, on comparing their respective amounts of litigation, with the view of testing thereby the merit of their respective legal systems, there are unavoidable difficulties in the way of a fair comparison between one country and another. Tabular returns from courts of justice, in the case of countries governed respectively by enacted and unenacted law, have, as was said above, never been inquired into with this object. But the tables are yet to be drawn up, which a person who knew what he ought to look for would be at the trouble of consulting. Tables, to be of any use for this purpose, must distinguish, by appropriate classification, the falling off in litigation, which is to be set down to the clearness with which a government has simplified or particularized its laws, from the falling off which as certainly would take place as often as a government had succeeded, by the help of complication, expense, or terror, in obstructing the entrance into its tribunals. Consequently we should not place much value (were they to be had) on numbers given in the gross, one way or the other. But there are facts in evidence which, whatever else may be their value, are fully sufficient to refute the assertion that codes must necessarily increase litigation. Filangieri, for example (t. v. p. 370), quotes from *Formey's abridged Exposition of the Royal Plan for the Reform of Justice*, the example of Pomerania. In consequence of its having been proverbially called *terra litigiosa*, it was the first selected by Frederick the Great for his experiment. The result was, that law-suits became rarer every day. After such an event as the French revolution, how many causes, besides the legal novelty of the code, might explain a sudden rush into courts of justice. Meyer observes, that, in the Low Countries, and in Rhenish Prussia, authentic interpretations of the Code Napoleon, during the short time that those countries had been subjected to its jurisdiction, had so satisfactorily verified the greater part of its debateable points, that this class of litigation was already sensibly on the decline. We have no reason to believe that it is not the same in France. Again, although it is essential to improvement in the law that juridical learning should be cultivated, and adjudged cases collected and studied, yet it is as essential to one of the main advantages expected from a code, that its auxiliary literature should not supersede, and, as it were, swamp the precise letter of the enacted law. The character of *cognoscibility* would otherwise again be lost. The opponents of codes have strenuously maintained that juridical learning comes of so progressive and masterful a stock, that a code cannot possibly escape from the alternative of all or none. The proposed dilemma leaves us to choose which of the evils we shall prefer. Whichever we may choose, we are asked in a sarcastic tone to calculate the mighty stakes which we have won, and to answer honestly, whether we find them worth the trouble which we have had in playing for them. On this point also the example of France is shaken *in terrorem* over England and America. All who would lay irreverent hands upon the ark of the common law, are solemnly and perseveringly assured that the drowning of the Code Napoleon in a sea of literature and jurisprudence, is already the most characteristic and undoubted fact in the legal history of France. This, by the way, were it correct, would be an ample answer to the narrowness and poverty of their legal learning, which Savigny conceived must be the consequence of the adoption of a code in the actual circumstances of that country. There can be no question that such a state of things as that described, supposing the representation accurate, would be a good *argumentum ad hominem* to any Frenchman who were to boast that *the Code Napoleon had solved the problem.* But it would prove nothing against codification in general; unless codifiers were to admit that the Code Napoleon, and the circumstances under which it had been introduced and administered, were all as good as possible. What, however, are the facts? In 1822, M. Dupin wrote his *Essay de la Jurisprudence des Arrêts*, with the view principally of remonstrating against the excess to which French advocates were carrying, especially in the provinces, the citation of judicial precedents in their arguments. He mentions as a flagrant abuse (whatever English practitioners may think of it), an instance where an advocate had cited fourteen cases. The practice, he adds, sometimes passed from the bar even to the bench. This was thought to look ominous. Fortunately we have the positive testimony of M. Dupin himself, that, notwithstanding an occasional dip or so, the code keeps its head triumphantly above the waters, and easily shakes off these encumbrances. In 1826, Mr Sampson had been so perplexed by what he was constantly hearing of the warning to codifiers, contained in the present state of French jurisprudence, that he took courage and addressed M. Dupin personally. "We are told," he says, "that the French codes have had but the life of a day; that the civil code, the model of all the others, is already almost buried by the multiplicity of laws, decrees, and commentaries with which it is loaded; and that, in a short time, the law will be sought for, not in the code, but in the solutions of its difficulties, and in the questions to which it has given rise. What degree of credit is due to the assertion?" It was impossible to consult an oracle more above all suspicion than the lawyer who, four years before, was on the alert, and had appeared to be himself sounding the alarm. But nothing can be more satisfactory than M. Dupin's answer on the question put to him. On the other hand, he properly recognizes and claims, in aid of a code, the full benefit of the just distinction between the learning of the jurist and the authority of the law. "The assertion," he answers, "is not true, that the jurisprudence of decided cases has prevailed in any way against the text of our codes; nor are we in any way threatened, even at a distance, with the danger of seeing the letter of our laws disappear under the load of interpretations. In every discussion, the text of the law is first looked into, and if the law has spoken, *non exemplis sed legibus judicandum est.* If the law has not clearly decided the point in question, its silence or its error is endeavoured to be supplied. But what country is there where decisions have not thus been used to supply the defects of legislation?" That this is, therefore, the fact in France, we must take M. Dupin's word; and we can have no difficulty in taking it. But the last paragraph admits that in France judge-made law is creeping in beyond what Meyer states it to have done in the Low Countries. And, though M. Dupin is protected against the error of putting the two sources of law, the legislative and the judicial, in opposition to each other, it is equally certain that inferior lawyers are equally secure. He had observed, in his *Jurisprudence des Arrêts*, that nothing was more common than to hear the two things put in contradiction, law and jurisprudence. *Il est de principe en droit que—mais la jurisprudence est contraire; c'est-à-dire, les arrêts ont jugé autrement.* After such a statement, he must not be surprised that strangers have been misled by his book, or that hostile readers of his letter should only use it in order to quote him against himself. Taking the letter by itself, all that is wanted in French legislative organization is an institution charged with the duty of condensing and carrying up the rectified spirit of their judicial decisions from the courts to the legislature. The legislature ought to permit no department in the state to exercise legislative power except itself; and it ought to be provided with the official means of duly discharging its trust. The province of the court of cassation, as a central and regulating power, is of infinite use. Its decisions are reported officially, but its province stops short of the still higher jurisdiction of the institution which is required for the present purpose. The necessity of a "council of laws" of this description has been frequently established by writers on the theory of legislation. It was mentioned during the discussions on the Code Napoleon, but unfortunately dropped through. Without it, any system of enacted law, however complete and correct, at a given moment, cannot long continue so. Jurisprudence must get ahead of law. Upon these points, therefore, how does the argument stand? Whatever may be the form in which laws subsist (code or no code), on either supposition fresh cases will be rising up, which are fairly determinable under the existing law, but only determinable by means of judicial interpretation. The question is, which of the systems offers the likelihood of the fewest of these instances occurring, and, when they do occur, that a ready and a rational interpretation will be at hand? Again, on either supposition, fresh cases must also be rising up, which, not falling within the existing law, must be provided for, directly or indirectly, by further legislation. There are many reasons, in our opinion, why, upon both occasions, viz. that of a demand for fresh interpretation and for fresh legislation, the work would be better done under a system of enacted than of unenacted law. For the converse conclusion we are aware of no reason whatsoever.

On the supposition that a code is decided upon, there remain behind very important considerations, which have been incidentally alluded to in former parts of the present paper, but which the space that we have already occupied will not allow of our formally discussing. 1. Every species of preliminary aid ought to be forthcoming. By what inquiries, arrangements, and writings, shall we best prepare the way for the formation of a complete and correct code, and facilitate its practical introduction? 2. The best machinery for executing the work ought to be procured. Is it likely to be most effectually performed by a single presiding mind, as Mr Bentham proposes? or by a commission more or less numerous? In the latter case, the principle on which the labour is distributed amongst the persons employed will have to be well considered. At this stage, too, the main question of all comes to be determined; that is, upon what principle the code is to be drawn up. Are the common law and the statute law to be kept distinct, or to be incorporated with each other? In either case, is the form to be that of articulate propositions, or of a miscellaneous digest? If a digest, is it to be arranged by title and method, or by historically following the course of time? 3. A code will want protecting against encroachment, from the moment that it is passed. Accordingly, the collateral regulations which may help to secure it by a vigilant control over the judiciary, must be carefully reviewed. For this end, questions of the following kind should be anticipated and fixed. Ought judges to be required in every judgment to specify the authority in the code on which their judgment is founded? Ought judges in pronouncing judgment, or advocates in conducting a forensic argument, to be restrained to a particular class of authorities? Concurrently with the formation of a code, a tribunal distinct from and raised above the ordinary courts (something like the court of cassation) may be wanted, in order to keep the ordinary administration of justice within the sphere to which it is one of the definite objects of a code that judicial interpretation should be confined. 4. Lastly, the code will want improving. This must be provided for by prospective regulations; by the creation of a minister of justice, or a council of laws, expressly appointed to superintend the unity and the efficiency of the entire system, and specially instructed to keep open an active communication between the tribunals and the legislature. Cases, either not provided for at all, or provided for imperfectly, will from time to time be brought unsuccessfully before the courts. The occurrence of such cases will direct the attention of the officers in question to a point upon which, it is evident, by the supposition, that new legislation is wanted for the purposes of justice. In other cases, which nevertheless have been successfully carried through the courts to final judgment, the interpretation of the courts will have wandered wider than is expedient from the strict letter of the law. The occurrence of this latter class of cases will point out the necessity of enlarging the provisions of the code into a more explicit conformity with the judicial construction put upon them. Theoretical writers, in contemplating the possibility of drawing nearer and nearer towards a perfect system, have perceived, that an institution of this kind is an indispensable condition. We repeat the observation here, from our sense of its importance. This is the object of the permanent commission recommended by Lord Bacon. And a council of laws for the absorption and assimilation of occasional jurisprudence into the general body of the law, is part of the political mechanism suggested in the "idea of a perfect commonwealth."

We cannot dismiss this subject without referring the reader to the concluding observations of the *Second Report of the Commissioners appointed to inquire into the Consolidation of the Statute Law* (page 29). The Report bears date July 1835. The suggestions are the deliberate recommendations of practical lawyers, acting under the authority of parliament. On remarking how nearly they approach to the recommendation of a code (for the whole principle of a code is contained in the suggestions), the thinking part of the public may well feel satisfied with the quiet progress which the question is making from year to year. The time is evidently approaching, perhaps more rapidly than we are aware, when "a work rare enough in the memory of times to show it excellent, and yet not so rare as to make it suspected for impossible, inconvenient, or unsafe," must be undertaken by us. Glory and gratitude to the men who shall be privileged in that day to stand in the presence of their fellow-citizens, having so raised their minds, and shaped their studies, as to be worthy of the "vocation" to which our age and country are assuredly called.

(E. E. E. E.)

LEGISLATOR, a lawgiver, or person who establishes the polity and laws of a state. Such was Moses amongst the Jews, Lycurgus among the Lacedemonians, and many others.

LEGITIMATION, an act by which illegitimate children are rendered legitimate.

LEGNAGO, a city of Italy, in the Austrian delegation of Verona. It is the capital of a district, and is strongly fortified. It is situated on the river Etsch or Adige, between which and the Tartaro is a marshy plain, on which a great extent of land produces excellent crops of rice. It is a well-built city, containing several churches and a fine theatre, and inhabited by 5920 persons. Long. 11. 13. 48. E. Lat. 45. 11. 18. N.

LEGUMEN, a species of seed-vessel which has two valves or external openings, enclosing a number of seeds which are fastened along one suture only. In this last circumstance the seed-vessel in question differs from that termed by botanists *siliqua*, in which the enclosed seeds are fastened alternately to both the sutures or joinings of the pod.

LEGUMINOUS, an appellation given to all plants the fruit of which is a legumen.

LEIBNITZ, GODFREY WILLIAM, BARON DE, a philosopher and mathematician of the first order, and the most universal scholar of modern times, was born at Leipsig on the third of July 1646. At the age of six he lost his father, Frederick Leibnitz, professor of law, and secretary to the university. After this event his mother placed him in the school of St Nicolas at Leipsig. Here he learned the principles of the Greek and Latin languages; but soon breaking through a routine ill suited to his precocious disposition, he applied himself to the study of the classic writers of both languages. Titus Livius and Virgil became his favourite authors; and in his old age he could still repeat entire cantos of the Roman poet. Early distinguished by a rare facility in performing his tasks, he often assisted such of his companions as dulness or idleness prevented from completing their own; and he himself informs us, that when scarcely fourteen, he composed in this way three hundred Latin verses in one day, without any elisions; but he takes care to add, "Credo a lectore non quæri quam cito, sed quam bene." At fifteen he entered on his academical career in the university of Leipsig, and, under the direction of Thomasius, devoted himself to the study of philosophy and the mathematics. He then passed a year at Iena, and returned to Leipsig, where he occupied himself with law and philosophy. Having soon mastered the details of the philosophical and mathematical sciences, the genius of Leibnitz now took a grander flight, directing him to the writings of Plato and of Aristotle. These he not only read and thoroughly comprehended, but used to pass entire days in a wood near Leipsig, endeavouring to reconcile the doctrines of the Academy with those of the Lyceum. He was scarcely twenty when he wished to be received as doctor of laws; but although some petty jealousies prevented his want of the requisite standing or age being dispensed with at Leipsig, this favour was granted him without difficulty by the university of Altorf, which at the same time offered him the situation of extraordinary professor of law. This, however, he declined; and leaving Altorf, he proceeded to Nuremberg, where a considerable number of men of science and learning were then assembled. At that time a society of chemists in that city occupied themselves with researches, the object of which was to discover the philosopher's stone. Tormented with a continual desire of acquiring something new, Leibnitz hoped to find, even in the reveries of these visionaries, some aliment for his mind. With this view he wrote to the society soliciting admission, and craving to be initiated into their mysteries. This letter, which was full of abstruse terms extracted from books of chemistry, and so conformable to the style of these mystics that he himself did not understand it, had prodigious success. Leibnitz was admitted a member of the society, and immediately appointed secretary thereto. His duty in this capacity consisted in registering their processes and experiments, and in extracting from the books of the chemists such things as might be of use to his associates in prosecuting their researches.

But happily for himself and the sciences, Leibnitz, whilst at Nuremberg, chanced to make the acquaintance of the Baron de Boineburg, chancellor to the elector of Mayence, who, being struck with his merit, and conceiving a high opinion of his talents and learning, recommended to him to apply himself particularly to history and jurisprudence, and expressed a desire to see him established at Frankfort, at the same time promising to obtain him some employment under his sovereign. Leibnitz followed the judicious counsel thus given him; and from this epoch, 1667, may be dated the real commencement of his literary career. It was at Frankfort that he brought out his *Nova Methodus discendæ docendæque Jurisprudentiam.* This little volume contained a *tableau raisonné* of the objects necessary for the double purpose expressed in the title; and in it he already displayed that practical spirit which enabled him to produce so much that is really useful. But that which placed its author in the first rank of philosophical writers, was the new manner in which he treated his subject, and the profound and ingenious views which he presented in regard to a science so long abandoned to routine and pedantry. The order, the clearness, the precision of the ideas, and the style which makes books live, contributed to give great popularity to this production, which, at a subsequent period, the author himself judged with impartiality.[1] We may also mention here a treatise published in 1669 in favour of the Prince of Neuburg, whom Leibnitz endeavoured to recommend to the Poles, as uniting, in a higher degree than all his competitors, the qualities they required in their king. This piece, which is somewhat lengthy, is written in Latin, and consists of sixty propositions, proved by a rigorous series of axioms, supported sometimes by expositions full of erudition, amongst which may be mentioned that under the head, *Eligendus Catholicus esto.* These propositions do not always follow in a necessary order; some of them are superfluous; and the form is a little fatiguing, especially since the interest of the subject has altogether ceased. The Prince of Neuburg was not elected king. But the work of Leibnitz did not on that account make a less sensation, and may, in fact, be regarded as a sort of *tour de force.* Boineburg, at whose request it had been composed, observing with satisfaction that Leibnitz justified the idea which he had conceived of his talents, attached him to the service of the elector, by causing him to be appointed counsellor of the chamber of revision in the chancery of the electorate of Mayence.

---

[1] Leibnitii *Opera Omnia*, tom. iv. p. 4. Geneva, Dutens, 1768.

The material occupations of this office, however, could not shackle a genius so vast and so active as that of Leibnitz. He held it during three years; and it was in this interval that he conceived the design of re-casting or new-modelling the Encyclopædia of Alstedius. It is not well known what his ideas then were respecting this project; but in some subsequent writings he explains himself in a manner sufficiently specific. He defines the Encyclopædia to be the "system of all the true and useful propositions then known." He thinks that, to be complete, it should contain definitions of all words; explanations of every fundamental and useful process in the liberal and mechanic arts; and, lastly, a summary of universal history. He then enumerates the different branches of human knowledge; indicates, as models to be followed in each, the principal existing works, amongst which he cites some of his own, and points out what remains to be done; and, finally, he recommends the order of the materials or subjects, in preference to the order of the alphabet.[1] In another passage he recommends subjoining to the treatise on each science a succinct account of its origin and progress, together with a list of the authors who have treated of it in detail. This was one of the predominant ideas of his life, one to which he appeared to attach great importance, and which occupied his mind as long as he lived.

Leibnitz now began to evince a mastery in almost all the sciences. He already enjoyed a great reputation as jurisconsult and philosopher; and he made himself known in physics by the publication of two treatises, viz. *Theoria Motus abstracti* and *Theoria Motus concreti*, which appeared in 1671. These theories were not admitted by philosophers, and did not deserve to be so; but they nevertheless excited astonishment by the boldness and originality of genius displayed in the conception of them. The year following he brought out, at the request of Boineburg, a small treatise entitled *Sacrosancta Trinitas per nova argumenta logica defensa.* In this work, intended to refute the attacks of a Pole named Wissowatius against the doctrine of the Trinity, the author endeavours to show that sound logic is not contrary to orthodoxy. Thus each year Leibnitz produced some work, which served as a new title of distinction, and enabled him to rank successively amongst the masters in the different sciences.

He had long entertained a desire to visit Paris. France then fixed the attention of the learned world, and extorted the admiration of Europe by the victories and the influence of the great monarch to whom she also owed an extraordinary development of military and literary glory. Leibnitz felt the importance of forming a connection with the learned men of that country; and Boineburg procured him the means of attaining this object, by proposing to him to accompany his son, whom he was then sending to Paris. Delighted with the proposal, and at the same time anxious to testify his gratitude to so zealous a patron, Leibnitz gladly accepted the offer, and set out for Paris in 1672. Placed amongst the illustrious men of that capital, and already worthy of them, he felt that ardour which leads to the distinction conferred by useful discoveries burn with redoubled force in his bosom. He now applied himself more especially to the mathematics, in which he had not as yet made any considerable progress; and this choice, in the midst of distractions of every kind in a new society, and of studies apparently much more attractive, is not one of the least proofs of the force and energy of his character. He found at Paris the illustrious Huygens; and he afterwards confessed, with that ingenuousness which is so becoming in great men, his obligations to the work *De Horologio Oscillatorio*, which had just appeared, and which, of all modern works, after those of Galileo and Descartes, proved the most useful to Leibnitz. The learned men whose society he frequented soon recognized his superior genius; and he confirmed this high estimate of his powers by the exposition of his ideas on the reform of the arithmetical machine of Pascal, or rather by the invention of a new machine, which he has described in the *Miscellanea Berolinensia*.[2] He obtained the suffrages of the Academy of Sciences, the members of which signified to him that he might be admitted into that illustrious body as pensionary, provided he chose to embrace the Catholic religion; but although the proposition was equally honourable to Leibnitz, as a proof of the estimation in which his talents were held, and to the Academy, which knew how to appreciate them, he did not think it proper or right for him to accept the offer.

His protector Boineburg died in 1673; and having no longer any business to detain him at Paris, he passed over into England, where he was received with the same distinction as in France. He had the satisfaction of making the acquaintance and enjoying the society of Boyle, Oldenburg, Collins, and other celebrated men, who disputed the palm in several of the sciences with the philosophers of the Continent; and it was from Collins that he received some hints concerning the invention of the method of fluxions, which had been discovered by Newton as early as the year 1664 or 1665, and by him communicated to Dr Barrow in 1669. But he had not been long in England when he received intelligence of the death of the elector of Mayence, by which he lost his pension. As this event made an entire change in his position, he resolved to communicate his embarrassments to the Duke of Brunswick-Lunenburg. This prince, who had always testified much regard for him, availed himself of the opportunity thus afforded him to assure Leibnitz of his favour, and to offer him the situation of counsellor, with a salary, at the same time granting him permission to prolong at pleasure his stay abroad. Overjoyed with this reply, which removed all cause of uneasiness as to his circumstances, Leibnitz returned to Paris, where he remained fifteen months buried in the depths of geometry. He quitted Paris in 1674, revisited England where he spent fifteen days, and proceeded by way of Holland to join his new benefactor. Leibnitz was still under thirty. At an age when great men are in general only beginning to distinguish themselves, each in his respective career, he had entered upon almost all in succession; had received, in the three countries which he had visited, testimonies of the highest esteem; and had established, with a great number of learned men, literary connections, which proved very advantageous to the sciences. We shall soon see him attain a still more commanding eminence, and at length arrive at that species of supremacy which he acquired over his age by the universality of his genius and talents.

Soon after his arrival at Hanover, he published his treatise on the Right of Sovereignty and of Embassy claimed by the Princes of Germany, who demanded the same privilege as the electors, namely, those enjoyed by kings. This work, which appeared under the name of *Cæsarinus Furstnerius*, and maintains that the emperor is the temporal head of the states of the West, as the pope is the spiritual head, possesses little interest at the present day; but it displays a profound knowledge of public law and of history, gives minute details of titles and ceremonial, and is written in that decorous and measured style which distinguishes all the writings of Leibnitz. He continued to cultivate all the sciences. He likewise supported, by every means in his power, the project of publishing the *Acta Eruditorum*, the first volume of which appeared at Leipsig in the year 1682. The celebrity which this journal acquired from its very commencement was in a great measure owing to Leibnitz, who enriched it with a great variety of curious pieces, from extracts of rare books, to problems in the higher geometry.

---

[1] See *Opera Omnia*, tom. v. pp. 181–185; also tom. v. p. 405.

[2] See *Miscell. Berolin.* i. xxxi. and fig. 73. In 1763 he had exhibited this machine to the Royal Society of London; and, in fact, it appears to have occupied his attention at intervals during the whole of his life. It is still preserved in the Museum of Göttingen, and is thought superior to other machines of the same kind. (Gersten, xvii. 232.)

The Duke of Brunswick died in 1679; but his successor, Ernest Augustus, afterwards George I. of England, inheriting the same esteem for Leibnitz, extended to him the same favour, and engaged him to write the history of the house of Brunswick. Leibnitz, anxious to obey this honourable call, resolved to visit the south of Germany and Italy, that in these countries he might make the necessary researches, and collect materials for the work. He devoted no less than three years to these journeys, consulting learned men, exploring libraries and archives, perusing old charters and manuscripts, and examining other monuments.[1] The fruit of so many researches was a prodigious collection of materials of all kinds. Besides the documents necessary for his history, it comprehended an immense multitude of political and diplomatic acts, as declarations of war, manifestoes, contracts of marriage, treaties of peace, bulls, and other public pieces. Leibnitz put these materials in order, and with their aid produced a work altogether different from, and independent of, the principal, and indeed one of much greater importance, entitled *Codex Juris Gentium Diplomaticus*, the first volume of which appeared in 1693, and the second in 1700, under the title of *Mantissa Codicis*. This collection contains a great number of acts which had never before appeared, and many others which, though previously published, had become very scarce. Read with discernment, it exhibits great knowledge, not only of history, but also of the genius of nations and languages, as well as of other subjects of inferior interest and importance. In other respects, any methodical mind might have been capable of a similar effort. What the genius of Leibnitz could alone produce is the preface to the work, in which, ascending to the principles of natural law and the law of nations, he expounds his ideas on both with great depth and originality. But that which distinguishes this book, and the preceding ones published by him on the same subjects, particularly his project for compiling a new body of law,[2] from those of the same epoch, is the tendency towards that reasonable reform of jurisprudence which was afterwards effected, in a great measure owing to the influence of Leibnitz, by whom its necessity was first pointed out; and likewise the union, recommended throughout, of the study of jurisprudence with that of religion and philosophy, which he regarded as the most solid basis of human happiness.[3]

In the midst of labours so various, he did not lose sight of the principal object of his recent travels, and occupied himself diligently in collecting the historians of Brunswick. He even composed for that house several writings, one of which, intended to establish its connection with the house of Este, procured for him the place of privy councillor of justice; a sinecure appointment destined to recompense his zeal without withdrawing him from his ordinary labours, amongst which the history, with its collateral branches, occupied an important place. The immense researches Leibnitz had made for the history of Brunswick, however, furnished him with materials for other works of a secondary kind. Thus in 1698 he published a new collection under the title of *Accessiones Historicæ* (in two vols. 4to), containing a great number of rare and curious pieces, which had escaped the observation of his predecessors. But nothing attests so much the extent of his views as what he did for the history he had undertaken. He commenced by collecting all the writers who had spoken of the house of Brunswick. The first volume appeared in 1707, the second in 1710, and the third in 1711; and subjoined were extracts from all the ancient authors relative to the tribes inhabiting the banks of the Elbe and the Weser, with notes explanatory of obscure passages. This collection, therefore, like those of Muratori, Duchesne, and others, had a merit independent of the object for which it had been compiled. But it was still, so to speak, only a preliminary work. The history even of Brunswick has not appeared. The learned Eckhard found amongst the papers of Leibnitz only the plan of it, which he published in the *Acta Eruditorum* of 1717. This history was to have been preceded by a dissertation on the primitive state of the globe, and particularly of Germany. A curious monument of the ideas of Leibnitz on this subject is contained in his *Protogæa*, a sort of essay, which, in 1693, he caused to be inserted in the Leipsig journal, and which was afterwards published separately by Scheidius (Göttingen, 1749, in 4to). In this production he attempts to explain the formation of the earth, and of the different substances which it includes. He admits a conflagration of the globe, then a general submersion, which, independently of the testimony of Scripture, is sufficiently established by the animal and vegetable remains that are frequently met with, and at different heights. This double hypothesis enables him to assign to the solid bodies (*corpora firma*) a double origin, that is, cooling after the fusion, and consolidation after the subsiding and evaporation of the waters; and in these ideas he finds the germ of a new science, which he calls *Natural Geography*. He enters into some details on minerals, and speaks of crystals, which he considers as the geometry of inanimate nature. Further, Leibnitz thought it incumbent on him to prove that animal and vegetable petrifactions were not a freak or sport of nature (*jeu de la nature*), and also to rebut forcibly the opinion as to the productive power of matter. This short exposition will suffice to give an idea of the immensity of the plan of Leibnitz, and of the prodigious variety of subjects which it embraces; a plan in many respects similar to that which has been followed by Herder and some other authors posterior to Leibnitz. It is much to be regretted that this design was not carried into execution, seeing it would probably have presented a solution of many historical and other problems of the greatest importance.

---

[1] It was in one of these expeditions that, finding himself overtaken by a tempest in the Adriatic Sea, whilst passing from Venice to Mesola, he heard the pilot of the bark, who did not imagine he was understood by the stranger, propose to the crew to throw into the sea the German heretic, whose presence on board was, he conceived, the sole cause of the squall (*bourasque*). Leibnitz, without appearing to have heard anything, or betraying the slightest emotion, drew from his pocket a chaplet or rosary, and commenced telling the beads with great seeming devotion. This quiet artifice saved him; one of the crew observing to the pilot, that as the man was not a heretic, it would be of no use to throw him into the sea.

[3] *Opera Omnia*, tom. vi. p. 4, *et passim*.

We must here take particular notice of one of those works which he continually let drop from his hands, and which were, so to speak, merely his pastimes; we mean his book on the origin of the Franks.[1] This people, he conceives, came originally from the shores of the Baltic Sea. He founds his opinion on the authority of the anonymous writer of Ravenna, and of Ermoldus Nigellus, a French poet of the ninth century, and on passages in several authors; alleging, moreover, that some of the ancients have confounded the Palus Mæotis with the Baltic Sea. This opinion was attacked by Father Tournemine, who combated it with much urbanity, saying, amongst other things, that, even in espousing a contrary hypothesis, the French did not disclaim being the countrymen of Leibnitz, since he appeared to have proved that the Franks had occupied the countries situated between the right bank of the Rhine and the Ocean. Gundling also published a refutation of the assertions of Leibnitz. The latter, who did not hold himself beaten, replied to both his antagonists; but, far from pretending to decide in the last resort, he appealed to the judgment of several learned men of his time, and, amongst others, to that of Huet and Montfaucon, whom he highly respected on account of their learning.

This seems the proper place to speak of the correspondence which Leibnitz for a long time maintained with Bossuet, in regard to the project for the re-union of the Protestants with the Catholics; a project which had for some time been pushed with activity, and which gave Leibnitz occasion to display attainments in theology which no one could ever have suspected in a mathematician of the first order. The details may be seen in the History of Bossuet by M. Bausset.[2] It is sufficient to state that this negociation, in which Leibnitz did not take part till the year 1692, was carried on with a degree of good faith very rare indeed in affairs of this description; that at one time it encouraged the hope of a successful and happy termination; and that it ultimately failed, owing to circumstances altogether independent of the matters which had formed the subjects of discussion. Amongst these may be reckoned the new political situation in which the elector of Hanover, to whom Leibnitz was altogether devoted, found himself placed in the year 1701. This prince saw reason to apprehend, that were he to labour longer in endeavouring to effect a reconciliation between the two communions, he might alienate the English people, who then manifested the greatest aversion to Catholicism, and might even bar his accession to the throne of England, to which he saw himself eventually called. From the *Syntagma Theologicum* of Leibnitz, however, it is clear that this philosopher had personally little disinclination to the doctrines of the Catholic church. To effect the re-union desired, he had reckoned much upon the influence of Louis XIV.; and it is curious to observe how this prince is judged by a man as independent of France as Leibnitz then was.[3]

Having been admitted a member of the Royal Society of London during his second visit to England in 1674, and associated to the Academy of Sciences at Paris since 1699, Leibnitz too well appreciated the advantages which academies owe to this combination of labours directed towards a common centre, not to second, by all the means in his power, the project for establishing a Royal Academy at Berlin, formed in 1700 by the elector of Brandenburg, who, the following year, assumed the title of king of Prussia. This prince had solicited the advice and assistance of Leibnitz. The reply of the latter is equally remarkable for the excellence and wisdom of its views, and the great simplicity by which it is throughout distinguished. "The object," says he, "ought to be to advance the happiness of men, which consists principally in wisdom and in virtue, and next in health and the comforts of life." He points out, as the first object, "the good education of youth, which includes also the regulation of studies; nothing being more important than to give a good cast to the mind as well as to the body." He then indicates summarily the plan of study which the Academy ought to recommend, and which is in the main that presently followed in the universities of Germany. The elector, as may well be supposed, adopted the views of Leibnitz. But he did more; he appointed him president of the new society, with the most unlimited powers, and without any restraint as to residence, or requiring that he should quit the service of the elector of Brunswick. The patent by which this office was conferred forms one of the most honourable titles ever bestowed on a man of learning and science.

Eleven years later, Leibnitz received marked proofs of confidence on the part of Peter I. of Russia, who, during his travels in Saxony, consulted him as to the execution of his vast projects relative to the civilization of his empire, and to whom Leibnitz in his turn communicated views with which that monarch expressed himself highly satisfied. In reward of this service he received the title of privy councillor. Lastly, the king of Prussia having died in 1713, Leibnitz, who foresaw the fall of the Academy of Berlin under his successor, repaired to Vienna to propose to the Emperor Charles VI. the institution of a similar body, wherein the sciences, which were about to be banished from Berlin, might find an asylum. Owing to several circumstances unconnected with Leibnitz, this project did not succeed; but every mark of consideration was lavished on the author. The emperor had already named him an aulic councillor; to this he now added a pension of two thousand florins, and employed every means to induce him to enter the imperial service. But Leibnitz, having declined these offers, went to fix his abode at Hanover, the elector of which had just been called to the throne of England.

In 1710 there appeared a volume of the *Miscellanea Berolinensia*, in which Leibnitz amply acquitted his debt as founder and president, and showed himself under forms so varied, that this volume alone would have been sufficient to insure him the reputation of universal genius. In proof of what is here said, it is only necessary to refer to his Essay on the Origin of Nations. This production exhibits the principal points of his system, a complete knowledge of which may be obtained by the perusal of his voluminous correspondence. By the aid of etymologies, and by means of analysis, Leibnitz endeavours to distinguish, through the successive alterations of languages, the origins of different nations, whom he divides into two great principal races,—that of the North and that of the South; then, by way of synthesis, he attempts to recompose the primitive language; and, finally, by means of this last operation, he labours to discover the relations between the signs of language and the ideas expressed by them. A great part of his labours had for their object to obtain these different results; he had himself plunged into the chaos before which almost all those who are more occupied with ideas than with words usually recoil: it formed one of the principal objects of his correspondence with the learned, as well as with travellers and missionaries; and new views on the language of the Copts or the Hottentots afforded him as much pleasure as the demonstration of a metaphysical truth, or the solution of an important problem in geometry. He is not always of the same mind with other learned men, and often contradicts received opinions. Like all etymologists, he has placed too much reliance upon fanciful coincidences and strained derivations; but, as he himself observed, errors are often useful to truth, and the search after the three great chimeras (*tria magna inania*), the philosopher's stone, the perpetual motion, and the quadrature of the circle, materially contributed to enrich the sciences.[1]

[3] See his second letter to Madame Brinon, *Opera*, tom. v. p. 558.

We have seen that Leibnitz succeeded in stamping the impression of his genius upon almost all kinds of knowledge. Natural history alone did not specially occupy his attention. His *Protogæa* is the only essay which he published on the subject; but in his works we often meet with proofs of the interest with which that science had inspired him; and it is not forgotten either in his general plans of education, or in his encyclopedical schemes. He was even a poet, and wrote verses in both the languages which he habitually employed; but it is right to add, that he acquired no illustration by his poetry, particularly his French verses, which are below mediocrity. Leibnitz is justly obnoxious to the literary reproach of having neglected his mother-tongue. But few of his writings appeared in German; and, what is not a little singular, the object of one of these pieces, which is very ill written, but exceedingly curious, is to recommend the study, practice, and improvement of the German language.[2] It is the more to be regretted that he did not himself labour in the execution of the plan which he proposed for attaining this object, as he might, by his influence, have effected that which was not accomplished until half a century afterwards, by the united efforts of the poets and literary men who distinguished that epoch. Besides, although he attaches great importance to that language, he does not appear to have understood its resources or its flexibility; for, in citing French Sapphic verses, he adds, that he does not believe a similar attempt would succeed equally well in German, although he had himself composed German anapests, in imitation of those of Seneca. In justification of Leibnitz, however, it is proper to add, that, being in correspondence with men of all nations, he naturally adopted the two languages, Latin and French, which were then in general and almost exclusive use.

His Latin style is neither elegant nor agreeable. Sometimes, however, he rises with his subject, and assumes a certain degree of majesty; but what may appear singular is, that we frequently meet with Gallicisms in his Latin compositions. We are less surprised to find Germanisms in his French prose; but these, however, are of rare occurrence. What strikes us most in his general style, is that grand and noble simplicity which distinguishes the French writers of the same period, and which is equally suited to pure reason and to sublime conceptions. In his works, as in his correspondence, there is an almost total absence of ornament. The most simple literary correspondence of the present day would exhibit more brilliancy and point than that of this great man; but, on the other hand, there is not one of his letters which does not contain the germ, the expression, or the development of some great or useful idea. Those of greatest extent commonly exhibit a sort of abridged or epitomized encyclopedical view of the state of the sciences, or the labours of the learned. But what we are never weary of admiring is his constant urbanity towards his correspondents, as well as the moderation and propriety exhibited in the expression of his judgments, whatever may be their occasional severity. No personal predilection, no national prejudice, ever disturbs the impartiality of that genius which viewed every thing as it were from on high. Embracing, so to speak, entire humanity, he incessantly recommends sending European missionaries into foreign countries, for the triple purpose of augmenting the amount and variety of our knowledge, establishing new commercial relations, and, above all, propagating the faith and the doctrine of Christianity. "Peu lui importe," says his French biographer, "que cette doctrine soit enseignée aux étrangers avec moins de pureté (on ne doit pas oublier que c'est un Luthérien qui parle), pourvu qu'elle se répande; et pour le succès des missions aux Malabar, entre autres, il conseille d'amener en Europe des habitants de cette côte, qui puissent y enseigner leur langue à des missionnaires Européens."

Leibnitz had a sweet expression of countenance, blended with a studious air; he possessed considerable gaiety, and his conversation was equally easy and instructive. His temper was naturally choleric; but, like most passionate men, he soon recovered his equanimity. Affable and communicative, he conversed freely with all who came in his way, and even carried his complaisance so far as, according to Fontenelle, to read a multitude of worthless books, out of politeness to their authors. He was never married. At the age of fifty he had some thoughts of forming a matrimonial connection; but as the lady he wished to espouse desired time to consider his proposal, Leibnitz also made his own reflections on the subject, and unluckily came to the conclusion that, though marriage is a good thing, a wise man ought to consider of it all his life. Much has been said of his avarice, but apparently without any sufficient reason. There is no doubt that his expenditure was exceedingly frugal; but he had no expensive passions or tastes to satisfy, and it is probable that his money accumulated without his being aware of it. The reproach of not having attended the service of his religion appears to be better founded. Nevertheless, he was equally attached to the forms and the substance of religion; and though he may have been wanting in punctuality of attendance, there is no ground whatever for questioning the sincerity of his sentiments. De Murr, in his *Journal of Nuremberg*, of the 11th March 1779, gives entire the Memoir of Eckhard, from which Fontenelle has derived most of the particulars inserted in his Eloge de Leibnitz. It is there stated, that Leibnitz was of a middle stature, and had black hair, a large head (which early became bald), and small eyes. He was short-sighted, but his vision continued excellent even until his last moments. He read the smallest characters, and his hand-writing was very minute. He had on the crown of his head an excrescence of the size of a pigeon's egg; and he always walked stooping, with his head projected, which gave him the appearance of being hunch-backed. He was of a thin habit, but of a vigorous temperament; he drank little, supped plentifully, and went to rest immediately after. He remained in bed only a few hours; sometimes he contented himself with sleeping in a chair, and, awaking about six or seven in the morning, instantly resumed his labours. When deeply immersed in study, he was known to have scarcely quitted his chair for weeks. But, however strong his constitution might be, it could not, in the long run, escape being undermined by a life so sedentary; in fact, the result was an ulcer in one of his legs. He was, besides, subject to the gout, the attacks of which became more frequent and painful towards the close of his life. He consulted few physicians; and his death appears to have been occasioned by blindly using a remedy which he had received from one of his friends, and which, producing violent spasms, terminated his existence in little more than an hour after he had swallowed it. He died on the 14th of November 1716, at the age of seventy. His monument, constructed in the form of a small temple, at the extremity of the great alley leading to the gates of Hanover, bears the simple inscription, *Ossa Leibnitii.*

---

[1] *Opera Omnia*, tom. iv. p. 199.

[2] See some remarks prefixed to his *Collectanea Etymologica*, in *Opera Omnia*, tom. vi. p. 651.

This extraordinary man is, beyond contradiction, one of those who have most highly exalted and ennobled the human understanding. But if he has merited our admiration by the astonishing variety of his labours, he is still more deserving of our gratitude on account of that practical activity which had always for its object the good of his fellow-creatures. Along with his most profound meditations, are presented the means which indicate their utility, and facilitate their application. His letters to Madame Brinon, his judgments on Shaftesbury, the whole of his correspondence, and a thousand passages in his writings, attest his profound respect for religion and morality; and he crowned his glorious life by giving, in his *Theodicæa*, the support of his influence to ideas at once the most sublime and the most necessary to the welfare of humanity. None of his labours was without glory to himself, or without advantage to society. His reputation would perhaps have been more solid and permanent had he less ambitiously grasped the whole circle of human science; yet it is difficult to name any department of human knowledge which has not profited by his labours, or received fresh illustration from his genius. As a theologian, he successively contended with the sceptics who believed too little, and with the Catholics, who, in his opinion, believed too much; with the heretics, who believed otherwise than was inculcated by the confession of Augsburg; and with the Arminians, who contended for the liberty of indifference. Yet the philosopher betrayed his love of union and toleration. In conjunction with the illustrious Bossuet, he laboured zealously to effect a reconciliation between the Catholic and Protestant churches; and if he failed in this truly Christian enterprise, his sincerity and good faith remain unimpeached; for, whatever may be thought of the selfish and worldly policy of the elector of Hanover, there can scarcely be but one opinion as to the purity of the motives which actuated Leibnitz. In an intolerant age, however, his orthodoxy did not escape suspicion; and the moderation which reflects so much honour on his memory was construed as indifference. His faith in revelation itself was accused, because he attempted to prove the doctrine of the Trinity by the principles of logic; and in the defence of the attributes and providence of the Deity, he was suspected of a secret correspondence with his adversary Bayle. As a metaphysician, he expatiated in regions too elevated ever to be explored by human genius and intellect. His pre-established harmony of the soul and body, if an untenable, is at least a sublime conception, and, as such, might have excited the jealousy of Plato himself; whilst his optimism, or the best of all possible worlds, seems an idea too vast for a mortal mind, and too beneficent for the actual condition of humanity. He was a natural philosopher, in the large and genuine acceptation of the term; and if, like some others, he amused himself with endeavouring to penetrate the mysteries of cosmogony, his *Protogæa*, or primitive earth, has not been useless to Buffon, and those who have succeeded him, in investigating the changes which have taken place in the constitution of the globe, and tracing the causes or agents to which these are to be attributed.

"I am not worthy," says Gibbon, "to praise the mathematician; but his name is mingled in all the problems and discoveries of the times; the masters of the art were his rivals or disciples; and if he borrowed from Sir Isaac Newton the sublime method of fluxions, Leibnitz was at least the Prometheus who imparted to mankind the sacred fire which he had stolen from the gods. His curiosity extended to every branch of chemistry, mechanics, and the arts; and the thirst of knowledge was always accompanied with the spirit of improvement. The vigour of his youth had been exercised in the schools of jurisprudence; and while he taught, he aspired to reform the laws of nature and nations, of Rome and Germany. The annals of Brunswick, and of the empire, of the ancient and modern world, were presented to the mind of the historian; and he could turn from the solution of a problem to the dusty parchments and barbarous style of the records of the middle age. His genius was more nobly directed to investigate the origin of languages and nations; nor could he assume the character of a grammarian without forming the project of an universal idiom and alphabet. These various studies were often interrupted by the occasional politics of the times, and his pen was always ready in the cause of the princes and patrons to whose service he was attached; many hours were consumed in a learned correspondence with all Europe; and the philosopher amused his leisure with the composition of French and Latin poetry. Such an example may display the extent and powers of the human understanding, but even *his* powers were dissipated by the multiplicity of his pursuits. He attempted more than he could finish; he designed more than he could execute: his imagination was too easily satisfied with a bold and rapid glance on the subject, which he was impatient to leave; and Leibnitz may be compared to those heroes, whose empire has been lost in the ambition of universal conquest."

Variety in unity, or unity varied, the expressive sign of every masterpiece of nature and of art, characterizes happily enough the productions of the genius of Leibnitz: extreme variety in the number and the species of the ideas with which he enriched the intellectual world, of the truths which he discovered or demonstrated, and of the elements of every order which he combined: absolute unity of principle, of method, of plan, and of object or aim, in this great and beautiful system, which connects and harmonizes the two worlds, spiritual and material, by subjecting them to the unity of a monarchy constituted under the government of the greatest and best of sovereigns. If we consider the *form* under which the different productions of this fertile genius present themselves, as detached pieces, or as fragments disseminated in vast collections, the mind is at first struck with their prodigious variety; and it is in this point of view that they most commonly appear, not only to biographers, but frequently to the historians of philosophy. But he who regards them in this light alone, will absolutely fail to discover the total and harmonious effect of this grand and beautiful scenography, or will only obtain partial views, and glimpses without any sequence or connection. The philosophical works of Leibnitz form a body of *doctrine*, the parts of which, whatever be their number or diversity, are nevertheless intimately connected, and all referrible to the same principles, as well as animated by the same spirit. This spirit, diffused throughout each of his numerous productions, pervades equally the works of the jurisconsult, the historian, the theologian, the natural philosopher, and the mathematician.[1] In proof of this, as far as regards the philosophical system of Leibnitz, it is only necessary to refer our readers to the ample and masterly exposition of it contained in the First Preliminary Dissertation to this work (part second, sect. ii. p. 122, et seq.), where the philosopher will find abundant aliment for thought, and the man of taste will discover new sources of gratification, in the splendid combination of genius, eloquence, and philosophy.

---

[1] See a very eloquent and learned exposition of the Philosophical System of Leibnitz, annexed to the life of that illustrious man in the *Biographie Universelle*, art. LEIBNITZ.

In like manner, with reference to the mathematical labours of Leibnitz, and more particularly his claim to the discovery of the differential calculus, it is only necessary for us to direct the reader to the Third Preliminary Dissertation (part second, sect. i. p. 517, et seq.) where the subject generally is treated with profound science and consummate ability, and the claims of Leibnitz to the discovery in question are weighed and judged with that perfect candour and judicious discrimination, which ought ever to guide such decisions. In recent times, however, a new competitor for the honour of this discovery has been brought forward by no less distinguished a personage than Laplace. "Il paraît," says he, in his *Essai Philosophique sur les Probabilités*, "que Fermat, *le véritable inventeur du calcul différentiel*, a considéré ce calcul comme une dérivation de celui des différences finies." Against this affirmation, however, Professor Playfair, in his review of Laplace's *Essai*, enters a strong and solemn protestation. "The age in which that discovery was made," says he, "has been unanimous in ascribing the honour of either to Newton or Leibnitz; or, as seems to us much the fairest and most probable opinion, *to both;* that is, to each independently of the other, the priority in respect of time being somewhat on the side of the English mathematician. The writers of the history of the mathematical sciences have given their suffrages to the same effect;—Montucla, for instance, who has treated the subject with great impartiality, and Bossut, with no prejudices certainly in favour of the English philosopher. In the great controversy to which this gave rise, all the claims were likely to be well considered; and the ultimate and fair decision, in which all sides seem to have acquiesced, is that which has just been mentioned. It ought to be on good grounds, that a decision passed by such competent judges, and that has now been in force for a hundred years, should all at once be reversed." He then proceeds to show that there are no such grounds, and concludes by observing, "Great as is the merit of Fermat, which nobody can be more willing than ourselves to acknowledge, and near as he was to the greatest invention of modern times, we cannot admit that his property in it is to be put on a footing with that of Newton or of Leibnitz;—we should fear that, in doing so, we were violating one of the most sacred and august monuments that posterity ever raised in honour of the dead."[1]

For the most extensive collection of the works of Leibnitz, we are indebted to Louis Dutens, who in 1768 published at Geneva, *Go. Gul. Leibnitii Opera Omnia*, in six vols. 4to. The first volume contains the *Opera Theologica*, amongst which are the *Theodicæa* in the Latin translation, and the tracts in controversy with Bossuet; the second includes the writings relative to logic, metaphysics, general physics, chemistry, medicine, botany, natural history, the arts, &c. particularly the *Meditationes*, the treatise *De Primæ Philosophiæ Emendatione*, the *Principia Philosophica*, and the Correspondence with Dr Clarke; the third is devoted to mathematics; and the three remaining volumes contain the writings of Leibnitz on history, antiquities, jurisprudence, philology, etymology, the Chinese, &c. Dutens, however, excluded from his collection all that had been published by Rud. Eric. Raspe at Amsterdam in 1765, 4to, under the title of *Œuvres Philosophiques de M. Leibnitz, tirées des ses manuscrits*, viz. 1. Nouveaux Essais sur l'Entendement Humain, intended as a refutation of Locke; 2. Examen du Sentiment de Malebranche, *Que nous voyons tout en Dieu;* 3. Dialogus inter Res et Verba, and some other small treatises on logic and the *Caractéristique Universelle*. Those who wish to possess all that has appeared from the pen of Leibnitz, must add to these two collections, 1. Essais de Théodicée, sur la bonté de Dieu, la liberté de l'homme, et l'origine du mal, Amsterdam, 1716; 2. Epistolæ ad diversos, cum notis Kortholti, Leipsig, 1734–1742, in four vols. 8vo; 3. Jo. Dan. Gruberi Commercium Epistolicum Leibnitzianum, Hanover, 1745, in two vols. 8vo; 4. Leibnitzii et J. Bernoullii Commercium Philosophicum et Mathematicum, editum a Cramer, Geneva, in two vols. 4to; 5. His Correspondence with Jablonski, published by Professor Kappe, Leipsig, 1745, in 8vo; 6. Epistolæ ad Schmidium, theologum Helmstadiensem, quas evulgavit Wesenmeyer, 1788; 7. Lettres choisies de la Correspondance de Leibnitz, publiées pour la première fois par G. H. Feder, Hanover, 1805, in 8vo; and, 8. A kind of *Leibnitziana* in the *Otium Hanoveranum*, 1718, in 8vo. The historical collections published by Leibnitz during his life were, 1. Codex Juris Gentium diplomaticus, Hanover, 1693, in folio; 2. Mantissa Codicis Juris Gentium diplomat. ibid. 1700, in folio; 3. Scriptores Rerum Brunsvicensium, ibid. 1707–1711, in three vols. folio; 4. Accessiones Historicæ, Leipsig, 1698–1700, in two vols. The number of works that have been published in relation to or in connection with Leibnitz, is immense, and therefore precludes any attempt at enumerating them. (A.)

LEICESTER, a town, the capital of the county of the same name, ninety-eight miles north of London. It is situated on the river Soar; but, by means chiefly of canals, has the means of conveyance to every part of the kingdom. It is an ancient town, said to have been built by King Lear, and was a place of strength when England was invaded by the Romans. It appears by Doomsday Book, that at the Norman conquest, it was a city, and populous. In the reign of Henry V. a parliament was held here. Richard III., after his defeat and death, was buried in a Franciscan convent, which then stood near St Martin's Church. The town was formerly fortified, and the remains of the wall may now be in many parts distinctly traced. The castle was a most extensive building; and though a great part of the ground upon which it stood is now covered with good dwelling-houses, other parts are entire, and a portion is appropriately made of use for courts of justice at the county assizes. Leicester is divided into six parishes, and the castle, which is extra-parochial. It contains six churches, and twenty-one chapels for dissenters of the different denominations. It is a corporate town; and its government, under the provisions of the municipal corporation act, consists of a mayor, recorder, high bailiff, forty-two councilmen, fourteen aldermen, ten magistrates, town-clerk, and other officers, with an efficient police. It sends, as before, two members to the House of Commons. The chief employment of Leicester is the manufacture of hosiery goods, long consisting of worsted and thread stockings, to which afterwards cotton hose were added, and of late years hose of silk. But within a very few years a large quantity of gloves of cotton have been made. The lace trade is also carried on to a very considerable extent. The smaller branches of trade, such as braces, cravats, tapes, children's fancy worsted boots and shoes, and other articles, are all in the most prosperous condition. The winding and sewing of cotton has also been carried on for several years, and is now arrived at the highest state of perfection. This part of the trade gives employment to vast numbers of young females, who are amply paid by their employers.

---

[1] *Edinburgh Review*, vol. xxiii. pp. 324, 325. See also M. Biot *Sur les Travaux Mathématiques*, annexed to the article LEIBNITZ in the *Biographie Universelle;* an exposition which contains a very full and distinct, though not altogether unprejudiced, view of the controversy above referred to.

The price of coals has been very much reduced of late years, in consequence of a new railway, constructed about four years ago, by which coals are conveyed from the northern part of the county. This has caused an active competition between the Leicestershire and Derbyshire coal-owners; and the reduction in the price of fuel has induced the manufacturers to erect steam-engines, which are employed in combing wool, spinning worsted, and other branches of trade. There are few towns in which are to be seen so very many charitable institutions for the relief of poverty, age, sickness, and general distress, and for the gratuitous instruction of the inferior classes. The country around is highly fertile, and the markets, held on Wednesday and Saturday, are amply and cheaply supplied. The population has rapidly increased, amounting in 1801 to 16,953, in 1811 to 23,146, in 1821 to 30,125, in 1831 to 39,306, and being at the present time (1836) not fewer than 44,000. The town has been greatly improved by the removal of old houses, and the erection of new ones. Several public buildings are in progress, viz. a new county lunatic asylum, and a reading and news-room, to be supported by subscriptions; a new theatre, and two new schools.

LEICESTERSHIRE, an English inland county. It is bounded on the north by Nottinghamshire and Derbyshire, on the west by the latter county and Warwickshire, on the south by Northamptonshire, and on the east by Rutlandshire and Lincolnshire. It is of a triangular form, and few of its limits are marked by nature, as the rivers Soar and Trent form only a part of its northern boundary, and the river Anker a smaller portion of its western frontier. Its greatest length from north to south is forty-five miles, and its greatest breadth from east to west thirty-five miles. Its area contains 816 square miles. It is divided into six hundreds, in which are ten towns and 196 parishes. The population at the four decennial enumerations has been estimated as follows:—In 1801 it amounted to 130,081, in 1811 to 150,419, in 1821 to 174,571, and in 1831 to 197,000. The annual value of the real property, as assessed in the year 1815, was L.902,217. The burials, including both the registered and unregistered, in the period from 1821 to 1831, appear to have been only one in fifty-two of the whole number of inhabitants then living. The proportion of illegitimate to legitimate births was only one to twenty-eight, whereas, in the whole of England, it was one to twenty. The occupations of the inhabitants are thus shown by Mr Rickman.

Occupiers of land employing labourers	2,656
Occupiers of land not employing labourers	2,145
Labourers employed in agriculture	10,542
Ditto employed in manufacture	12,240
Employed in retail trade or handicraft	13,772
Capitalists, bankers, &c	1,421
Labourers not agricultural	3,701
Other males twenty years of age	2,509
Male servants	1,164
Female servants	5,994

The chief towns of the county, and their population in 1831, were,

Leicester	39,306
Loughborough	10,800
Hinckley	6,468
Ashby-de-la-Zouch	4,400
Melton-Mowbray	3,356
Donnington Castle	3,182
Market-Harborough	2,272
Wigston Magna	2,174

The county of Leicester may be described generally as a level district, the undulations of which are very gentle, and exhibit but few interesting prospects. The exceptions to this remark are the Charnwood Hills, on the northern part of the county, which rise in an insulated mass, and from the summit of which the rest of the county appears extended in a well-wooded but even surface under the feet. The most lofty eminence of this range of hills (commonly denominated the *Forest*, though it is destitute of trees) is Bardon Hill, the summit of which is 850 feet above the level of the sea. The Vale of Belvoir, in which the castle of the Duke of Rutland stands, displays much beauty, of a soft rather than a romantic or picturesque character.

None of the rivers of this county are considerable streams, nor are any of them calculated for the conveyance of commodities, except the Soar, for a short distance; but they are abundant, and contribute to increase the beauty and fertility of the district. Their names are, the Anker, Avon, Blackbrook, Deane, Eye, Scalford, Sence, Snite, Soar, Swift, Trent, Willand, and Wreke. The intercourse of the county, both in its own different districts, and with the surrounding parts of the kingdom, is amply provided for by several navigable canals. One of these connects the town of Leicester with the Grand Junction Canal, in Northamptonshire; another communicates by Loughborough with the river Trent; another from the coal-mines near Ashby-de-la-Zouch, passes by Hinckley, and proceeds into Warwickshire; and one is designed to connect Melton-Mowbray with the centre of Rutlandshire.

Though the soil is various, yet, in general, it may be classed under the denominations either of clay or of loam; for there are very few portions of it that are calcareous, sandy, or gravelly. The best soil is on the hills, and generally the valleys consist of a cold clay, very wet in the winter, and with the turf so tender as scarcely to bear the treading of sheep in that season. The soil is naturally productive of the best and most abundant crops of grass, and is better fitted for feeding cattle than for arable culture. In consequence of this quality, a very small portion is under the plough; but that portion produces most excellent wheat, oats, and beans, which have acquired great celebrity. There are few open fields now remaining, and the quantity of waste land is very small. The principal productions of the county are sheep and cows. Mr Bakewell, whose fame in improving the breeds of all cattle is generally known, has been the means of stocking this county first, and afterwards many other parts of England, with a race of sheep produced by various crosses, which by many farmers is now preferred to every other, and universally known by the name of the *new Leicesters.* They unite perfect symmetry of shape with the smallest possible quantity of bone and offal, and their wool is both fine and abundant. The horned cattle were, in like manner, improved by the lessons of this skilful breeder; and no part of England exceeds Leicestershire either in its beef or in the produce of the dairy. The cheese commonly made is in great request throughout all the north of England; and the kind called Stilton, from having been first sold in that town, though made near Melton-Mowbray, is perhaps the richest in the world. The process of making it was long kept a secret in a few villages, but is now universally known. Its richness arises from one half the milk being skimmed, and the cream taken from that added to the other milk, so that the cheeses have double the usual quantity of cream in their composition. Bakewell improved also the breed of horses to a great extent. In this line there was less room for any extraordinary progress; but his black horses, of the cart kind, originating principally from mares which he brought from Flanders, enabled him to introduce the method of ploughing with two horses abreast, by which much labour in agriculture has been saved.

The manufacture of most consequence in this county is

Leicestershire.

that of hosiery, which gives employment, more or less constant, to two thirds of its inhabitants. The quantity of stockings made here is prodigious, and supplies the greater part of the British dominions, as well as many other parts of the world, with those of an inferior and middling quality. Stocking-frames were invented about 1590; but the first introduced in Leicestershire was used at Hinckley in 1640. Since that period many improvements in the machinery of them have been made. The chief seat of this manufacture is in the town of Leicester, in which there are 3400 manufacturers, of whom 3000 are stocking-makers. Loughborough has 900, Hinckley 700, Sheepshead 500, Wigston and Shilton 280 each; and in many of the smaller places there are to be found to the number of from 100 to 200 weavers of hosiery and gloves. About 700 men are employed in making lace, chiefly at Melton-Mowbray and Quornden. The makers of machinery are numerous, and in the county some linen is manufactured, and also some carpets. The making of stuffs at Harborough has nearly disappeared.

In the north-west part of the county there are extensive mines of valuable coal, which supply the inhabitants of the surrounding districts. With them terminate the mines in the direction of the German Ocean to the southward. At Bredon, on the confines, the singular rock called Bredon Hill is composed of a most valuable kind of limestone, which forms an excellent cement in water, and which was used for building the pier of Ramsgate.

The Roman roads are still visible in many parts of the county, though in many instances they have been covered by the more recent highways. The Watling-Street road, the Fossway, and the Via Davana, traversed the county, and have been traced with great accuracy by antiquaries. At Radcliffe, on the Wreke, is an ancient tumulus, generally attributed to the Celts, 350 feet in length, and 120 in breadth. At Leicester, which was a Roman station, are still visible the remains of the architecture of that people, in what is called the Jewny Wall, consisting of a mass of stones, brick-work, and dilapidated arches, built in alternate courses of brick in three layers, and of stone. Near the town is the vestige of a British Cursus, according to some antiquaries, or of a Roman camp, according to others. At different and distant periods a great number of coins have been discovered, with the names of Titus, Trajan, Diocletian, Constantine, Constantius, Hadrian, and other Roman emperors. Other Roman antiquities have been found at Rothley, at Wanlip, at Market-Harborough, at Burrow, and at Cathorpe. The Gothic remains are considerable; those of the Abbey of Leicester, of the Nunnery of Grace Dieu, Ulvestoft Priory, Laund Priory, the Castle of Ashby-de-la-Zouch, the churches of Hinckley and Melton-Mowbray, and the chapel of Market-Harborough, all reward the inspection of the antiquary.

In the church of Lutherworth, the pulpit and part of the vestments of the great reformer Wickliffe are still preserved. He was buried there in the year 1387; but in 1428, his bones were taken up and burnt, and the ashes thrown into the river, by order of the council of Sienna. Leicestershire has been the scene of two great military events, which have been the means of transferring the government of England; the first, the battle of Bosworth, which terminated the reign and life of Richard III. in 1485; and the other, the battle of Naseby in 1645, which led to the death of Charles I., and the subsequent elevation of Oliver Cromwell.

One of the chief distinctions of this county is its adaptation for fox-hunting, which has given rise to establishments for that purpose at the town of Melton-Mowbray, where, at the appropriate season, are collected the best horses, dogs, and riders that England produces, and where, also, may be seen some of the most wealthy and distinguished of the nobility and gentry.

By the reform bill this county received an addition of two members to the House of Commons; for which purpose it is divided into two parts, the northern and southern divisions. The polling-places for the former are Loughborough, Melton-Mowbray, and Ashby-de-la-Zouch; and for the latter, Leicester, Market-Harborough, and Hinckley. The town of Leicester, as before, returns two members.

LEIGH, a town and port, with a custom-house, of the hundred of Rochford, in the county of Essex, thirty-nine miles from London. Here much corn is shipped for the supply of the metropolis. The population amounted in 1801 to 570, in 1811 to 702, in 1821 to 905, and in 1831 to 1254.

LEIGH, a large parish, consisting of two chapelries and four townships, in the hundred of West Derby, in the county of Lancaster, 198 miles from London. It is placed conveniently for water communication with most of the great rivers of the kingdom; from which, and the great extension of the cotton trade, its population has been rapidly augmented. The inhabitants amounted in 1801 to 12,976, in 1811 to 15,565, in 1821 to 18,372, and in 1831 to 20,083.

LEIGHLIN, a decayed town of Ireland, situated in the county of Carlow, about forty-three miles from Dublin, near the river Barrow. It is a borough, and formerly returned two members to the Irish parliament. The patronage is in the bishop of the diocese, this being a bishopric united to Ferns.

LEIGHTON, ROBERT, a prelate of eminent talents and learning, and of the most exalted piety, was born in the year 1611. His father, Alexander Leighton, a descendant of the ancient family of Ulyshaven in Forfarshire, commenced his academical studies at St Andrews, and afterwards repaired to Leyden, where he took the degree of M. D. That he ever took the degree of D. D. seems to be asserted without sufficient evidence: as he became a clergyman, it was apparently taken for granted that he must have proceeded in the theological faculty. That he never was a professor of philosophy in the university of Edinburgh, is still more certain. Dr Leighton fixed his residence in London, where he betook himself to the practice of physic, but met with strong opposition from the college of physicians. He was however doomed to encounter persecution in a more appalling form. His indignation was violently moved by the lordly pretensions and popish practices of the bishops of those days; and he was induced to prepare an elaborate volume, under the title of *Sions Plea against the Prelacie*, in which his indignation was very strongly expressed. With the view of conducting his work through the press, he retired to Holland; and we find that the year 1629 he became minister of the English church at Utrecht. But his conscientious scruples respecting the observance of the appointed festival days, which he doubtless regarded as a remnant of superstition, induced him to resign his charge within the space of a few months.[1] His book having been printed in the course of the preceding year,[2] he returned to London. Two copies were presented to parliament two days before its dissolution; and it was immediately perceived that the author had treated the bishops with uncompromising severity, describing them as men of blood, and maintainers of superstitious worship and antichristian government. This last position was verified by the inhuman treatment to which he was himself subjected. He was soon afterwards arrested by two pursuivants of the high commission, and was first conducted to the house of Dr Laud, who was then bishop of London, and who may with sufficient propriety be described as the inquisitor general of England. On the bishop's warrant he was committed to a dark, cold, and loathsome dungeon in Newgate, to a place not fit for the reception of a Christian's dog, and there he was kept, without meat or drink, from Tuesday night to Thursday at noon. It was only after a dismal interval of fifteen weeks that the inquisitors would permit even his wife to visit him. Four days after his commitment, she had been treated with the most barbarous inhumanity and indecency by a pursuivant and other ruffians, who were sent to ransack his house, under the pretext of searching for Jesuits books. They presented a pistol to the breast of a boy five years of age, threatening to shoot him if he did not inform them where the books were to be found; "and so affrighted the poor child, that he never recovered it all his days." They not only carried off books and manuscripts, but robbed the house of arms, clothes, and furniture. His wife had sufficient courage to remind them that a day of reckoning might yet come; and come it did, in a signal manner, to the chief authors and abettors of such flagitious proceedings. Some of Laud's emissaries infested him in Newgate; and, by means of flattering and deceitful promises, one of them prevailed upon him to confess that he was the writer of the book in question. During a subsequent visit, he offered to procure him pardon and favour, on condition of his disclosing the names of those who had encouraged him to write; but although nearly five hundred individuals had, by their subscriptions, testified their approbation of Sions Plea, he had too much magnanimity to betray any one of his friends and adherents. After this refusal, he was brought before the court of Star-Chamber, and required to answer a long information, setting forth his many and grievous offences. He admitted that he was the author of the book, but denied all criminality of intention. No counsel dared to plead his cause, and he returned to prison in order to await his doom. It was the opinion of four physicians that poison had been administered to him in Newgate. He had been seized with a violent distemper, which was accompanied with loathsome symptoms, and his strength was so completely exhausted that he could not be produced before this atrocious court. In his absence the following sentence was unanimously pronounced on the 4th of June 1630: that Dr Leighton should pay a fine of L.10,000; that the high commission should degrade him from his ministry; that he should be brought to the pillory at Westminster during the sitting of the court, and should there be whipped; that after whipping he should be set upon the pillory for a convenient time, should have one of his ears cut off, one side of his nose slit, and his face branded with the letters S. S. denoting a Sower of Sedition; that he should then be carried back to prison, and, after an interval of a few days, should again be pilloried at Cheapside, should then likewise be whipped, have his other ear cut off, and the other side of his nose slit; and should then be detained in close custody in the Fleet-prison for the remainder of his life. When this sentence was pronounced, it has been stated that Laud pulled off his cap, and gave thanks to the God of mercy; nor does such an act appear to be in any respect inconsistent with the general character of the ferocious and unrelenting bigot to whom it is imputed.[1] This is the same individual whom the high-churchmen of our own times describe as an excellent prelate. Between the passing and the execution of the sentence, Leighton made his escape from prison; and two of his countrymen, named Anderson and Elphinstone, were each fined L.500 for aiding and abetting him in his flight. He was however retaken in Bedfordshire; and, before the expiration of a fortnight, having again been committed to the Fleet, he endured the first part of his punishment on the 26th of November: it was inflicted with the most unrelenting severity; the second part followed after a short interval; and his bodily frame having thus been miserably shattered, he lingered in prison for the tedious space of nearly ten years.[2] In 1640 he presented a petition to the long parliament, reciting the direful persecution to which he had been subjected, and he now obtained such redress as could be afforded to him; "but," as Dr Benson has too truly remarked, "no sufficient reparation, in this world, could possibly be made to a man so highly injured."[3]

[2] An Appeal to the Parliament; or Sions Plea against the Prelacie: the summe whereoff is delivered in a decade of positions, in the handling whereoff the Lord Bishops and their appurtenances are manifestly proved, both by divine and humane lawes, to be in-

Robert Leighton, the eldest son of this learned and persecuted individual, is commonly represented as a native of Edinburgh; but as Burnet speaks of his father's having sent him to be educated in Scotland, it has been inferred that he was born in London.[4] The name of his mother we have not found recorded, but it is certain that he was of the issue of the first marriage. His father's second wife was Isabel the daughter of Sir William Musgrave of Ireby in Cumberland, and she had previously been married to William Calverley, and Ralph Hopton, Esq.[5] After the death of her third husband, she retired to the neighbourhood of Leeds; and she appears to have been left in very comfortable, if not affluent circumstances. Her stepson was educated in the university of Edinburgh, and became one of its brightest ornaments. He "was accounted a saint from his youth up;" but he seems originally to have had, what the readers of his works could not easily have supposed, some slight propensity to satire. He in-

truders vpon the priviledges of Christ, of the King, and of the Common-weal; and therefore, vpon good evidence given, she hartelie desireth a iudgement and execution. *Printed the year and moneth wherein Rochell was lost.* 4to.

[1] Even in the solitude of his prison, Laud seems to have entertained a deliberate opinion that Dr Leighton's punishment had fallen short of his deserts. "In which book of his," he remarks very coolly, "were many things, *which in some times might have cost him dearer.*" (Hist. of the Troubles and Tryal of Laud, vol. i. p. 198.) The archiepiscopal palace was converted into a state-prison, of which Leighton was appointed keeper; and this amiable prelate felt it as a great trial of his patience, that a person who had thus "been censured in the Star-Chamber," should come with a warrant from the House of Commons to demand the keys. See likewise p. 203, and Dr Nalson's Collection, vol. i. p. 512.

He elsewhere states that he was employed in "writing Memoirs of the charitable Madam Leighton, and her admirably pious son-in-law, Archbishop of Glasgow." (Diary of Ralph Thoresby, F.R.S. vol. ii. p. 10. Lond. 1830, 2 vols. 8vo.)

curred some degree of academical censure, for writing an epigram on the provost of the city, whose name was Aikenhead. The point of it is, "his head cannot be made of oak, or his fiery nose would have produced combustion."[1] That he made uncommon progress in his studies, is sufficiently evident from his works. He took the degree of A. M. in the year 1631. After he left the university, his father, who was then groaning under the rod of the oppressor, sent him to travel on the continent, and he thus enlarged his knowledge of men and manners. Among other places, he visited Douay, where some of his relations were then residing. In France he spent several years, and learned to speak the language like a native. Returning to the land of his fathers, he became a clergyman of the presbyterian church, having on the 16th of December 1641 been ordained minister of Newbattle, a parish within seven miles of Edinburgh. He had now attained the age of thirty, and was qualified by his natural endowments, as well as by his acquired knowledge, to appear with singular advantage in his public capacity. "His preaching," says Bishop Burnet, "had a sublimity both of thought and expression in it. The grace and gravity of his pronunciation was such, that few heard him without a very sensible emotion: I am sure I never did. It was so different from all others, and indeed from every thing that one could hope to rise up to, that it gave a man an indignation at himself and all others. It was a very sensible humiliation to me, and, for some time after I heard him, I could not bear the thought of my own performances, and was out of countenance when I was forced to think of preaching. His style was rather too fine; but there was a majesty and beauty in it that left so deep an impression, that I cannot yet forget the sermons I heard him preach thirty years ago. And yet with this he seemed to look on himself as so ordinary a preacher, that while he had a cure, he was ready to employ all others, and when he was a bishop, he chose to preach to small auditories, and would never give notice beforehand: he had indeed a very low voice, and could not be heard by a great crowd."[2]

The leading clergy of that period were men of fervent zeal, and several of them possessed no mean share of learning; but in various instances the heat of their zeal seems to have dried up the sources of their Christian charity; nor did they think it lawful, not to say expedient, to tolerate any differences of religious opinion. The sinfulness of toleration was a topic too frequently inculcated. It must at the same time be recollected that there was no existing church from which the principles of toleration could then be learned. The bishop proceeds to state that Leighton "soon came to see into the follies of the presbyterians, and to dislike their covenant; particularly the imposing it, and their fury against all who differed from them. He found they were not capable of large thoughts: theirs were narrow, as their tempers were sour. So he grew weary with mixing with them. He scarce ever went to their meetings, and lived in great retirement, minding only the care of his own parish at Newbottle near Edenborough. Yet all the opposition that he made to them was, that he preached up a more exact rule of life than seemed to them consistent with human nature: but his own practice did even outshine his doctrine." Let it in the mean time be remembered that the follies of the episcopalians were at least equally conspicuous, and that they took a more bloody direction. The presbyterians did not let loose a ferocious band of ruffians to cut the throats of men and women, if they merely refused to pray as they were directed.

In the year 1648 Leighton declared in favour of the engagement for the king, and thus exposed himself to the hazard of being subjected to heavy penalties. When some of his parishioners who had been concerned in the unfortunate expedition to England, were enjoined to make a public profession of their repentance, he studiously avoided all mention of the grounds of the war, but admonished them that "they had been in an expedition, in which, he believed, they had neglected their duty to God, and had been guilty of injustice and violence, of drunkenness, and other immoralities, and he charged them to repent of these very seriously." The earl of Lothian, who resided in his parish, and entertained a high esteem for his character, had sufficient influence to protect him from any serious annoyance. It is however evident that he found himself placed in a very uncomfortable situation; and his uneasiness must in no small degree have been encreased by the differences which unhappily ensued between the resolutioners and protesters. He was at length induced to resign the pastoral charge of Newbattle. This resignation took place in the year 1652; and, under the date of May 24, 1653, we find the subsequent record of a conversation with Brodie, one of the judges. "I spoke with Mr Leighton. He did shew me that the composing of our differences was not a harder task than the finding out the Lord's mind by them, both the procuring and final cause. He thought holiness, the love of God and our brethren, was the chief duty God was calling us unto, and sobriety and forbearance to one another. He knew not if it were not from his natural temper, or something of the English air; but he thought it was the safest to incline *in mitiorem partem*. Much persecution was there upon our imposing upon one another, as if we were infallible, allowing none that differed from ourselves in the least measure. He thought the Lord would break that which we would so fain hold up, our judicatories: he had observed so much of our own spirit in them these many years past, that he had lothed them for the most part, and wearied of them."[3]

The office of principal of the university of Edinburgh became vacant by the death of John Adamson in the year 1652. He was a man of learning and reputation, nor did the electors fail to look for a worthy successor. Their first choice fell upon William Colville, minister of the English church at Utrecht; but some difficulties, whether political or ecclesiastical, having been interposed, Leighton was elected on the 17th of January 1653, and was persuaded to accept of an office for which he was so eminently qualified by his character, his talents, and his attainments. With the office of principal is conjoined that of primarius professor of divinity. The other professor of divinity was David Dickson, who published several theological works, and was a man of high consideration with his own party. Some of Dr Leighton's academical prelections, as well as his addresses to the students, have been preserved, and they exhibit the author in the most favourable light. He continued several years in that post, says Burnet, "and was a great blessing in it; for he talked so to all the youth of any capacity or distinction, that it had great effect on many of them. He preached often to them; and if crowds broke in, which they were apt to do, he would have gone on in his sermon in Latin, with a purity and life that charmed all who understood it. Thus he had lived above twenty years in Scotland, in the highest reputation that any man in my time ever had in that kingdom."

During the vacations, he made occasional excursions to

England, and even to Flanders. He had an opportunity of observing the character of the eminent men who frequented the protector's court; but, according to the account which he gave to his friend, "he could never see any thing among them that pleased him. They were men of unquiet and meddling tempers; and their discourses and sermons were dry and unsavoury, full of airy cant, or of bombastic swellings. Sometimes he went over to Flanders, to see what he could find in the several orders of the church of Rome. There he found some of Jansenius's followers, who seemed to be men of extraordinary tempers, and studied to bring things, if possible, to the purity and simplicity of the primitive ages; on which all his thoughts were much set." The restoration of a heartless and profligate monarch, who had derived no wisdom from experience, introduced a material and fatal change in the state of ecclesiastical affairs in Scotland. The great body of the people were firmly and zealously attached to the presbyterian polity and form of worship, which Charles had solemnly promised to maintain: but episcopacy was considered as more favourable to those maxims of government which he and some of his councillors were inclined to propose; and the resolution, equally iniquitous and impolitic, was finally adopted of forcing upon his northern subjects an ecclesiastical establishment, which the most honest and devout portion of them regarded as but one small degree removed from popery. The undaunted opposition to the innovations of the late unfortunate reign, seems to have been utterly erased from the memory of those who now devised the restoration of episcopacy in Scotland. It was doubtless thought a wise and dexterous measure to place at the head of this new establishment a very conspicuous proselyte from the presbyterian cause, James Sharp, who had recently been appointed professor of divinity at St Andrews,[1] and who had been sent to London as the accredited agent of the Scotish clergy. He was a person of address and of talents for business; but being at the same time aspiring and unscrupulous, he could not resist the temptation which was now presented to him; and in an evil hour he entered upon a career of ambition which he pursued with great violence, and which was at length brought to a very tragical termination. Sharp was nominated to the archbishopric of St Andrews, Fairfowl to that of Glasgow; Sydserf, who had been bishop of Brechin and Galloway, and who was the sole survivor of the ancient bench, to the see of Orkney; and Hamilton, a brother of Lord Belhaven, to that of Galloway. Leighton, who was then in London, on his return from Bath, where he had been residing for the benefit of his health, was persuaded to accept of a bishopric, and he selected that of Dunblane, a small diocese, as well as a small revenue. He had previously cultivated an acquaintance with several episcopalians, and, among others, with the father of Bishop Burnet. He was a man of so much primitive piety, and was so uncontaminated with worldly ambition, that no person of ordinary candour can impute his change to any unworthy motive. He evidently considered church government as a matter not determined by any positive injunctions, but open to the adjustment of bodies of men varying in their opinions, and placed in a variety of circumstances. In the mere name of a bishop there is nothing pernicious; but that the office may be rendered highly pernicious, the history of the church has too clearly evinced. According to Dr Paley, "the appointment of various orders in the church, may be considered as the stationing of ministers of religion in the various ranks of civil life. The distinctions of the clergy ought, in some measure, to correspond with the distinctions of lay-society, in order to supply each class of the people with a clergy of their own level and description, with whom they may live and associate upon terms of equality."[2] In conformity with this evangelical distribution of rank and office, the English curate is reduced to the condition of the labouring poor, and the archbishop is raised to the level of the first nobility. All this is frequently described as very apostolical: but we are not aware that the apostles recommended their successors to a seat in the house of lords; nor have they clearly taught us to infer that the prosperity of the church of Christ has any necessary connexion with such splendour. We recollect the appropriate remark of a writer eminently distinguished by his acuteness and candour of mind. "Exorbitant wealth annexed to offices," says Dr Campbell, "may be said universally to produce two effects. These two effects are, arrogance and laziness." And on this subject what were the sentiments of Dr Leighton? "It is true," he remarks, "that penury and want of competency in temporals, in those who bring an eternal treasure, argues base ingratitude, and is most unworthy of well-constituted churches. But where the remedy exceeds too far, it becomes worse than the disease, being compounded of carnal prudence and ambition, both of which are enmity to God." Ecclesiastics raised to great and superfluous wealth, may in some instances be fully as much inclined to imitate the folly as to improve the piety of their fashionable associates. We are very far from wishing to reduce the order to a primitive state of poverty; but we are not prepared to acquiesce in the opinion, that the personal respectability, or the spiritual influence, of a clergyman, is more effectually secured by five thousand than by five hundred pounds a year.

The nomination of the other bishops was chiefly left to Dr Sharp; but the promotion of Dr Leighton, who was not such a person as he would have been inclined to select, was solely imputed to his brother Sir Ellis Leighton, who was at that period secretary to the duke of York. In his face, as well as in the vivacity of his talents, he resembled the bishop of Dunblane, but in other respects no two individuals could be more unlike each other. The knight was as unprincipled as the other courtiers of that time and place. In order to favour his schemes of ambition, he had embraced the Romish faith, and the general tenor of his conduct exhibited a great laxity of moral feeling. But, in such a foul atmosphere, who could be free from contamination? He was intimately acquainted with Lord Aubigny, a brother of the duke of Richmond's, who had not only changed his religion, but had even entered into holy orders. It was perhaps one recommendation to the king's favour, that he led a very vicious life; and as he was in the secret of his majesty's religion, and was acquainted with his private schemes for the advancement of popery, he enjoyed an ample share of his confidence. Sir Ellis impressed this nobleman with a very high opinion of his brother's qualifications: he did not overlook his celibacy and his ascetic mode of life, as being conformable to the popish notions of piety; nor did he scruple to aver, what was very remote from the truth, that he was persuaded of his being secretly inclined to their own faith. Through this polluted channel did the learned and pious Leighton arrive at his high station in the church; for at the suggestion of Aubigny, the king nominated him to a bishopric, and thus excited the suspicion of Sharp, who did not wish for a coadjutor of his spiritual habits and superior character. It was not without the utmost reluctance that he was induced to accept of this preferment. Of the four bishops-elect, only two had received episcopal ordination; but before the consecration of the other two, Sharp and Leighton, it was considered as absolutely necessary to ordain them deacons and priests. The same necessity was not recognized at the consecration of Scotish bishops in the year 1610; for when Bishop Andrews maintained that they must first be ordained presbyters, as having received no episcopal ordination, Archbishop Bancroft replied that "there was no necessity, seeing where bishops could not be had, the ordination given by the presbyters must be esteemed lawful; otherwise that it might be doubted if there were any lawful vocation in most of the reformed churches."[1] Wycliffe had adopted the opinion of St Jerom, that in the age of the apostles,[2] presbyter and bishop were names of the same office-bearers. This opinion was likewise maintained by the founders of the English reformation; and Cranmer has unequivocally stated that "a bishop may make a priest by the Scriptures, and so may princes and governors alsoe, and that by the auctority of God committed to them, and the people alsoe by their election." Archbishop Whitgift declares that no form of government is by the Scriptures prescribed to the church of God; and the mutability of ecclesiastical government is asserted by Hooker, and other distinguished writers of that period. This indeed appears to have been a prevalent opinion, till the pontificate of the unhappy Laud, who was but too anxious to complete the assimilation of the English with the Romish hierarchy, and whose mind was deeply tinctured with the most abject superstition. The divine right of episcopacy was not however maintained by some of the most eminent divines of the succeeding age. Bishop Stillingfleet, in a very learned and able work,[3] has completely demonstrated that bishop and presbyter were originally different appellations of the same office-bearers; that the apostles have nowhere enjoined any particular form of ecclesiastical polity; and that "a mere apostolical practice being supposed, is not sufficient of itself for the founding an unalterable and perpetual right for that form of government in the church, which is supposed to be founded on that practice." And as to what is called the perpetual succession in the church,[4] he has distinctly averred, that "this personal succession, so much spoken of, is sometimes attributed to presbyters, even after the distinction came into use between bishops and them."—To this idle or arrogant ceremony of reordination, Sharp, who "had swallowed down greater matters," submitted with no small reluctance; but, as Dr Mitchell has remarked, "Leighton submitted easily to this, not because he was eager to put on a mitre, but because he had good sense enough, and a sufficient acquaintance with Scripture, and the writings of early antiquity, to know that it was a matter of no consequence, whether he submitted to it or not." These two were privately ordained deacons and priests; and on the 15th of December 1661, all the four were publicly consecrated in Westminster Abbey. The good bishop of Dunblane was scandalized at the feasting and jollity which followed this religious ceremony. They travelled towards Scotland in one coach; and Leighton stated to Burnet that he believed his associates were weary of him, for he was very weary of them. When he found that they intended to enter the metropolis with some degree of pomp, he left them at Morpeth, and reached Edinburgh a few days before them. The other bishops made a kind of triumphal entry; the lord chancellor, with the nobility and privy counsellors, as well as the city magistrates, having joined in a procession, and met them in due form. Soon after their arrival, other six bishops were consecrated; but they were not subjected to the previous ceremonial of being ordained deacons and priests. Parliament assembled in the month of April 1662, and most of the bishops immediately took their seats: Leighton did not however appear among them, and he adhered to the practice of only attending in his place when he expected some discussion concerning religion or the church. He did not permit his friends to give him the title of lord, nor did he willingly acquiesce in its being given to him by others; for he evidently had not unlearned the presbyterian lesson, that Christ has no lords in his house.

[2] Paley's Sermons and Tracts, p. 92. Lond. 1815, 8vo.

He speedily found that his new associates were for the most part men from whom the cause of religion could derive very slender aid, and that the affairs of the church were managed with as little wisdom as moderation. Sharp, though a man of talents, was artful and insincere. Of the other prelates, very few were eminently distinguished by either learning or piety, and the parochial clergy were in all respects greatly inferior to those whom they had supplanted. "By these means," says Bishop Burnet, "Leightoun quickly lost all heart and hope; and said often to me upon it, that in the whole progress of that affair there appeared such cross characters of an angry providence, that, how fully soever he was satisfied in his own mind as to episcopacy itself, yet it seemed that God was against them, and that they were not like to be the men that should build up his church; so that the struggling against it seemed to him like a fighting against God. He who had the greatest hand in it proceeded with so much dissimulation; and the rest of the order were so mean and selfish; and the earl of Middleton, with the other secular men that conducted it, were so openly impious and vicious, that it did cast a reproach on every thing relating to religion, to see it managed by such instruments." He governed his own diocese like a truly Christian bishop, labouring very assiduously in his vocation, and uniformly pursuing measures of gentleness and conciliation. But the ecclesiastical, as well as the civil rulers, were generally inclined to pursue measures of so opposite a nature, that he at length adopted the resolution of resigning his bishopric. This resolution he announced to the clergy of Dunblane in the year 1665, and afterwards proceeded to London, for the purpose of communicating it to the king. He gave his majesty a true account of the proceedings in Scotland, "which, he said, were so violent, that he could not concur in the planting the Christian religion itself in such a manner, much less a form of government. He therefore begged leave to quit his bishopric, and to retire; for he thought he was in some sort accessory to the violences done by others, since he was one of them, and all was pretended to be done to establish them and their order." The king appeared to be somewhat moved at the good bishop's recital; and having spoken of the primate with severe reprehension, he promised to enforce a more lenient method of proceeding with the nonconformists. He thus prevailed upon Leighton to retain his bishopric; and he so far fulfilled his promise as to suspend the functions of the ecclesiastical commission. But most of his Scotish ministers were so utterly destitute of all principle and humanity, that no material improvements ensued. The presbyterians were subjected to such intolerable grievances, that at length, in the year 1666, they had recourse to arms, but their military proceedings were very speedily terminated at the battle of Pentland-hills. The atrocious murders committed among a conscientious and resolute people, were committed under the sanction of a king who had once professed the same religion with themselves, and who was now consigning them to the sword and halter, because they refused to adopt the rites of a church whose creed he had secretly renounced. If every other action of his life had been free from reproach, this cold-blooded and unrelenting villany would alone have been sufficient to ensure the execration of all posterity. What a lamentable picture of human depravity was exhibited in the two monarchs of Britain and France; men immersed in the most debasing sensuality, surrounded by the most profligate of both sexes, and, from the polluted atmosphere in which they daily breathed, sending forth mandates to their subjects to shape their religious creed and ritual according to the pattern which their majesties were graciously pleased to prescribe. To this point, the matter only seems capable of exciting derision; but a very different sentiment arises in the mind when we recollect that both Charles and Louis were prepared to carry havoc and devastation where other means of conversion had been found ineffectual. In the French king there might be a certain species of consistency when he cut the throats of his protestant subjects, because they refused to embrace popery: but in the English king there was manifestly none when he cut the throats of his presbyterian subjects, because they refused to embrace episcopacy; unless we can discover some consistency in the mere consideration, that those converted to episcopacy were brought one step nearer to his own faith.

In the midst of these direful scenes of persecution, the gentle spirit of Leighton must have been heavily afflicted. He opposed all the violent methods of producing a formal compliance with the established mode of worship; and to the nonconformists of his own diocese he granted a liberty of conscience which the laws of those flagitious times did not acknowledge. Not satisfied with this limited indulgence, he made great exertions to secure a more general and permanent toleration. With this view he repaired to court in the year 1669, and had two audiences of the king. One of those who seconded his endeavours was Dr Wilkins, bishop of Chester. The king at length addressed a letter to the privy council, commanding them to indulge such of the presbyterian clergy as were peaceable and loyal, so far as to suffer them to serve in vacant churches, though they did not submit to the present establishment. But this indulgence was not attended with any beneficial effects: the presbyterians and episcopalians were alike dissatisfied, and the country long continued in a state of the most unhappy agitation. It was violently opposed by the clergy of the diocese of Glasgow; and the archbishop, Dr Alexander Burnet, gave so much offence to Lauderdale by his zeal against it, that he found it expedient to retire to a private station, with the provision of an annual pension. It was not without much reluctance that Leighton was induced to accept of the vacant office. As his translation was attended with some informalities, he became, according to the strictness of the ecclesiastical law, not archbishop, but administrator of the archbishopric.[1] He removed to Glasgow in 1670, and in the course of the preceding year his friend Dr Gilbert Burnet had been elected professor of divinity in that university. They appear to have lived upon terms of great cordiality; and to Burnet, who became bishop of Salisbury, we are indebted for a copious and most interesting record of his evangelical virtues.

Soon after his translation, he held a synod of his clergy, who uttered many complaints of being deserted and ill-treated by the people. In his public and private discourses, he exhorted them to consider themselves as ministers of the cross of Christ, to lay aside all desire of revenge, and to humble themselves before God. "This was a new strain to the clergy. They had nothing to say against it; but it was a comfortless doctrine to them, and they had not been accustomed to it. No speedy ways were proposed for forcing the people to come to church, nor for sending soldiers among them, or raising the fines to which they were liable. So they went home, as little edified with their new bishop as he was with them." Accompanied by the professor of divinity, he afterwards visited some of the most eminent of the indulged ministers in different districts, with the view of persuading them to listen to terms of accommodation. Although his overtures were but coldly received, he was unwilling to abandon all hope of conciliation. In the presence of the earls of Lauderdale, Rothes, Tweeddale, and Kincardine, he held a conference at Edinburgh with six of the presbyterian clergy. He spoke for nearly half an hour, with much gravity and force, but his arguments in favour of episcopacy produced no effect upon those to whom they were addressed, nor was a second conference attended with a different result. He sent to the western counties six episcopal clergymen, Burnet, Charteris, Nairne, Aird, Cook, and Paterson, who were commissioned to preach in vacant churches, and to argue with the people on the grounds of conformity and accommodation. "The people of the country," says Burnet, "came generally to hear us, though not in great crowds. We were indeed amazed to see a poor commonalty so capable to argue upon points of government, and on the bounds to be set to the power of princes in matters of religion: upon all these topics they had texts of Scripture at hand; and were ready with their answers to any thing that was said to them. This measure of knowledge was spread even among the meanest of them, their cottagers, and their servants. They were indeed vain of their knowledge, much conceited of themselves, and were full of a most entangled scrupulosity; so that they found, or made, difficulties in everything that could be laid before them. We staid about three months in the country; and in that time there was a stand in the frequency of conventicles." Against these conventicles two acts had recently been passed. In reference to one of them, Leighton declared to the earl of Tweeddale, that the entire tenor of it was so contrary to the common rules of humanity, not to say Christianity, that he was ashamed to participate in the councils of those who could frame and pass such laws. Nor must it be forgotten that these atrocious laws were not suffered to continue a dead letter. At Paisley the archbishop had another meeting with the presbyterians, to the number of about thirty; and their conferences came to a final close in the month of January 1671, when, at a meeting in the earl of Rothes's house in Edinburgh, Hutcheson declared, in the name of his party, that "they had considered the propositions made to them, but were not satisfied in their consciences to accept of them."

In the course of one year, four bishoprics became vacant, and the choice of them was offered to Dr Burnet. Leighton was authorized to recommend such individuals as he thought most worthy of promotion; but neither Burnet, Charteris, nor Nairne, could be induced to undertake the episcopal office in the church, as it was then constituted; and as they were among the most learned and respectable of the episcopal clergy, he thus found himself beset with new discouragements. He had failed in his endeavours to conciliate the presbyterians, and was suspected and hated by the episcopalians. In utter despair of securing any benefit to others or satisfaction to himself, he adopted the resolution of resigning his preferment, and retiring from all public employment. He accordingly repaired to London in 1672, and, not without considerable difficulty, obtained the king's permission to resign after an interval of one year. He however retained the archbishopric till the year 1674, and Alexander Burnet was then restored to his former dignity. Leighton now returned to Edinburgh, and for some time lived within the precincts of the university; where the chair which he had occupied was not unworthily filled by William Colville, who had been put in nomination at the time of his own election. He afterwards retired to England, and spent the remainder of his life with his sister Sapphira, the wife and finally the widow of Mr Lightwater of Broadhurst, a demesne in the parish of Horsted Keynes and county of Sussex. He had another sister married to a Mr Rathband, of whom we find no further mention. His time was chiefly spent in devout seclusion, but he frequently officiated in the parish church, and in some others of that vicinity. In the year 1679, an attempt was made to draw him from his retreat: at the suggestion of the duke of Monmouth, the king was induced to request that he would again fix his residence in Scotland, and use his endeavours in reconciling the ecclesiastical animosities which still prevailed in that country. "I desire you may go down to Scotland with your first conveniency, and take all possible pains for persuading all you can, of both opinions, to as much mutual correspondence and concord as may be; and send me, from time to time, characters both of men and things. In order to this design, I shall send you a precept for two hundred pounds sterling upon my exchequer, till you resolve to serve me in a stated employment." But the duke soon afterwards ceased to have any influence in the affairs of either kingdom, and this negociation seems to have made no further progress.

---

[1] Keith's Catalogue of the Scottish Bishops, p. 267. Russell's edit. Pref. to Symson's Life of Sharp, p. xlviii.

In the year 1684 Leighton was urged by Dr Burnet to make a journey to London, for the purpose of meeting the earl of Perth, chancellor of Scotland, who had expressed an earnest wish to see him; and his friend entertained a hope that this "angelical man might have awakened in him some of those good principles which he seemed once to have, and which were now totally extinguished in him." When he reached the metropolis, Burnet was surprised to see him look so fresh and active at his advanced period of life: his hair was still black, and he retained much of his former vivacity, with the same quickness of conception and strength of memory. He however spoke of his work and journey being nearly finished at the same time: he was next day seized with a pleurisy; on that which ensued, he suddenly fell into a state of insensibility, which continued for about twelve hours, and he then expired without pangs or convulsions. He was constantly attended by that friend whose zeal had prevailed upon him to undertake this fatal journey. He died on the 25th of June 1684, in the seventy-fourth year of his age, ten years after he had ceased to be archbishop of Glasgow. He closed his earthly pilgrimage at an inn in Warwick-lane, and his remains were deposited at Horsted Keynes. A great portion of his income had been devoted to deeds of charity and benevolence; and by a will, dated on the 17th of February, he had destined the residue of his property to charitable uses.[1] To his sister, and to her son Edward Lightwater of Broadhurst, he only left a small token of grateful acknowledgement of the great kindness with which they had treated him while he was their guest. His library he bequeathed to the cathedral of Dunblane, for the use of the clergy of that diocese; and although the fashion of a cathedral and diocese has there passed away, the library is still preserved in the same place.

The character of Leighton has been drawn by Bishop Burnet in very striking colours. "He had great quickness of parts, a lively apprehension, with a charming vivacity of thought and expression. He had the greatest command of the purest Latin that ever I knew in any man. He was a master both of Greek and Hebrew, and of the whole compass of theological learning, chiefly in the study of the Scriptures. But that which exalted all the rest was, he was possessed with the highest and noblest sense of divine things that I ever saw in any man. He had no regard to his person, unless it was to mortify it by a constant low diet, that was like a perpetual fast. He had a contempt both of wealth and reputation. He seemed to have the lowest thoughts of himself possible, and to desire that all other persons should think as meanly of him as he did himself: he bore all sorts of ill usage and reproach, like a man that took pleasure in it. He had so subdued the natural heat of his temper, that in a great variety of accidents, and in a course of twenty-two years' intimate conversation with him, I never observed the least sign of passion, but upon one single occasion. He brought himself into so composed a gravity, that I never saw him laugh, and but seldom smile. And he kept himself in such a constant recollection, that I do not remember that ever I heard him say one idle word. There was a visible tendency in all he said to raise his own mind, and those he conversed with, to serious reflections. He seemed to be in a perpetual meditation. And, though the whole course of his life was strict and ascetical, yet he had nothing of the sourness of temper that generally possesses men of that sort."[2] In another work, he mentions the archbishop in terms of similar commendation. "I have now laid together with great simplicity what has been the chief subject of my thoughts for above thirty years. I was formed to them by a bishop that had the greatest elevation of soul, the largest compass of knowledge, the most mortified and most heavenly disposition, that I ever yet saw in mortal; that had the greatest parts as well as virtues, with the perfectest humility that I ever saw in man; and had a sublime strain of preaching, with so grave a gesture, and with such a majesty both of thought, of language, of pronunciation, that I never once saw a wandering eye where he preached, and have seen whole assemblies often melt in tears before him; and of whom I can say with great truth, that in a free and frequent conversation with him for above two and twenty years, I never knew him say an idle word, that had not a direct tendency to edification: and I never once saw him in any other temper but that which I wished to be in, in the last minutes of my life. For that pattern which I saw in him, and for that conversation which I had with him, I know how much I have to answer to God: and though my reflecting on that which I knew in him, gives me just cause of being deeply humbled in my self, and before God, yet I feel no more sensible pleasure in any thing, than in going over in my thoughts all that I saw and observed in him."[3]

Of his indifference to literary reputation we have a sufficient proof in the fact of his never having committed any of his works to the press. For their preservation we are chiefly indebted to James Fall, D.D. who had been principal of the university of Glasgow, and, having vacated his office at the Revolution, was collated to the precentorship of the cathedral of York.[4] The first of these posthumous works is a volume of "Sermons; published at the desire of his friends after his death, from his papers written with his own hand." Lond. 1692, 8vo. This was followed by his "Prælectiones Theologicæ, in Auditorio Publico Academiæ Edinburgenæ (dum Professoris Primarii munere ibi fungeretur) habitæ: una cum Paræenesibus in Comitiis Academicis ad Gradus Magistralis in Artibus Candidatos. Quibus adjiciuntur Meditationes ethico-criticæ in Psalmos iv. xxxii. cxxx. Ex Authoris autographo fideliter editæ." Lond. 1693, 4to. Of a very recent date, there is a more correct edition, published under the title of "Roberti Leighton, S. T. P. Archiepiscopi Glasgnensis, Prælectiones Theologicæ; Paræneses; et Meditationes in Psalmos iv. xxxii. cxxx. ethico-criticæ. Editio nova, recensente Jacobo Scholefield, A.M. R.S.L.S. Græcarum Literarum apud Cantabrigienses Professore Regio, et Collegii SS. Trinitatis nuper Socio." Cantabrigiæ, 1828, 8vo. An English translation of the prelections and exhortations had been published with the title of "Theological Lectures, read in the Publick Hall of the University of Edinburgh; together with Exhortations to the Candidates for the Degree of Master of Arts: translated from the original Latin." Lond. 1763, 8vo. Mr Pearson is evidently mistaken in supposing that these compositions had been translated by Dr Fall. The *Meditationes* were translated under the inspection of Dr Doddridge, and inserted in his edition of the author's works. Dr Fall next edited "A practical Commentary upon the first Epistle General of St Peter." York and Lond. 1693–4, 2 vols. 4to. The first volume was printed at York, and the second at London. "Perhaps," says the late Mr Orme, "there is no expository work in the English language equal altogether to the exposition of Peter. It is rich in evangelical sentiment and exalted devotion. The meaning is seldom missed, and often admirably illustrated. There is learning without its parade, theology divested of systematic stiffness, and eloquence in a beautiful flow of unaffected language and appropriate imagery."[1] These original editions are most incorrectly printed. The commentary was followed by "An Exposition of the Creed, Lord's Prayer, and ten Commandments; with two Discourses, on St Matth. xxii. 37, 38, 39, and Heb. viii. 10; to which is annext a short Catechism." Lond. 1701, 8vo. The volume contains a portrait of the author, engraved by R. White. Of his works edited by Dr Fall, the last is a small collection of Tracts. Lond. 1708, 12mo. It includes the Rules for a Holy Life, a Sermon, and the Catechism. After a considerable interval appeared "Select Works of Archbishop Leighton, some of which were never before printed. To which is prefixed an account of the author's life and character." Edinb. 1746, 8vo. This publication was soon followed by "The Expository Works and other Remains of Archbishop Leighton, some of which were never before printed. Revised by P. Doddridge, D.D. with a preface by the doctor." Edinb. 1748, 2 vols. 8vo. There are many other editions of a subsequent date, but among these we shall only specify that of Lond. 1825, 4 vols. 8vo. To this collective edition, which has been more than once reprinted, the Rev. John Norman Pearson has prefixed a copious life of the author, and has made some important additions to the old stock of biographical materials. (x.)

[4] Diary of Ralph Thoresby, F.R.S. vol. i. p. 365. He afterwards mentions that he "visited the excellent Dr Fall at the duke of Queensberry's in London." (Vol. ii. p. 24.) Professor Scholefield apparently considered him as some very obscure person: "edente quodam Jacobo Fall."

LEIGHTON BUZZARD, or BEAUDESERT, a market-town of the hundred of Manshead, in the county of Bedford, forty-one miles from London. It is situated on a branch of the river Ouse, and has a good market-place, with a cross in the centre. The only trade is some lace-making, and some plaiting of straw. There is a good market, which is held on Tuesday. The population of the town amounted in 1801 to 1963, in 1811 to 2114, in 1821 to 2749, and in 1831 to 3330, but the whole parish at the last census contained 5149 inhabitants.

LEINSTER, the eastern province of Ireland, bounded by Ulster on the north; by St George's, or the Irish Channel, on the east and south; and by the provinces of Connaught and Munster on the west. The capital city of this province and of the kingdom is Dublin. It contains twelve counties, viz. Carlow, Dublin, Kildare, Kilkenny, King's County, Longford, Louth, Meath, Queen's County, West Meath, Wexford, and Wicklow.

LEIPA, a city of the circle of Leutmeritz, in the Austrian kingdom of Bohemia. It stands on the river Polzen, and has a gymnasium, 688 houses, and 4918 inhabitants. It is a manufacturing place, producing linen and woollen cloths, glass, and earthenware.

LEIPZIG, one of the circles into which the kingdom of Saxony is divided. It extends over 1195 square miles, comprehends twenty-three cities and towns, with 794 villages, and contains 216,564 inhabitants. It consists of two parts, Leipzig and Wurzen, which are again subdivided into bailiwicks. The city of the same name is the capital. It is situated on the river Pleisse; is surrounded with walls, which are useless for any defensive purpose; and contains a population, including the garrison and the university, of 38,000 persons. The university is more remarkable for its learning than for the number of its students, but it has a good library, observatory, anatomical theatre, and other establishments for professional education. There are one Catholic, one Reformed, and eight Lutheran churches. Some of the streets are narrow, but the houses are large, and the market-place is a fine square. It is a place abounding in manufactures of various kinds; but few of them are on an extensive scale, and most of them for articles of convenience and luxury. It has a prosperous trade, chiefly arising from its two great fairs, which are resorted to by producers and consumers from all parts of Germany, many of the former being from England, France, the Netherlands, and Switzerland. It is the great emporium of German literature, where books, at whatever place printed, are commonly published. It has been the scene of battles in 1631 and in 1646, and especially in October 1813, when the fate of the French empire was decided in what the Germans have called "the battle of nations." Long. 12. 16. 31. E. Lat. 51. 20. 24. N.

LEITH, a populous sea-port town in the county of Edinburgh, situated on the southern shore of the Frith of Forth, at the mouth of the Water of Leith, and distant about a mile and a half from the centre of the Scottish capital. The ancient name of the town, which is of considerable antiquity, having been for several centuries not only the first, but almost the only port in Scotland, was Inverleith, a compound word of Gaelic origin, *inver* signifying in that language the mouth of a river, and being thus descriptive of the situation of the port.

Although there are traces of the existence of Leith in ancient documents as far back as the twelfth century, yet little is certainly known regarding it until the fourteenth, when it had acquired such importance, and begun to hold out such prospects of commercial benefit, as to attract the notice and excite the cupidity of the magistrates and citizens of Edinburgh, who, with the view of availing themselves of the advantages it offered for maritime adventure and speculation, obtained a grant of its harbour and mills from King Robert I. for the yearly payment of fifty-two merks. This right they subsequently extended so far as to secure almost the entire trade of the port, to the exclusion, and even ruin, of its inhabitants, by purchases at various times from Sir Robert Logan of Restalrig, who was proprietor and baronial lord of Leith; and finally completed its feudal subjection by purchasing the superiority of the town from Queen Mary, to whose mother, Mary of Lorraine, it had been sold by Logan, in the year 1565, for 10,000 merks. Even at this early period, the trade of Leith was considerable, at least comparatively so; and not a few names of celebrity in the ancient naval annals of Scotland are found associated with it. From these we may select that of the Bartons, famous as mariners in Scottish story.

---

[1] Orme's Bibliotheca Biblica, p. 288. Edinb. 1824, 8vo.

Besides being a place of pretty high antiquity, Leith is also one of no small note in the history of Scotland, having been the scene of more military service perhaps than any other town in the kingdom. Neither has it been less remarkable for the frequency of its misfortunes. In 1313 all the vessels in the harbour were burned by the English, and again in 1410. In 1488 (an occasion, however, on which it suffered no injury) it was occupied by the forces commanded by the disaffected lords who had risen in arms against James III., after the defeat of the latter at Bannockburn. In 1544 it was plundered and burned, its pier destroyed, and its shipping carried off, by the Earl of Hertford, whom Henry VIII. had sent down by sea to Scotland, with an army of 10,000 men, to avenge the insult which he conceived the Scotch had offered him, by refusing to betroth their young queen, Mary, to his son Prince Edward. Three years subsequently to this, viz. in 1547, immediately after the battle of Pinkey, it was again plundered and burned by the English under Hertford, now Duke of Somerset, and protector of England. On this occasion, although the town itself did not suffer to the same extent as before, its whole shipping, together with all that in the Forth, was entirely annihilated by the English admiral, Lord Clinton, who co-operated with Hertford with a fleet of no less than thirty-five ships of war, besides tenders and other vessels. Four years after this, the town was fortified by Desse, a French general, who came over with 6000 men to assist the queen-regent in suppressing the Reformation. On the completion of these fortifications, which consisted in throwing a strong and high wall, with towers at intervals, around the town, the queen-regent took up her residence there, and, surrounded with her countrymen, hoped to be able to maintain her authority in the kingdom. These measures, however, had only the effect of widening the breach between her and her subjects, till they finally took up arms, and besieged her in her stronghold. In October 1559, the lords of the congregation, as the disaffected leaders called themselves, invested Leith with an army, but after various ineffectual attempts to gain access to the town by scaling the walls, they were driven back with great slaughter by a desperate sally of the besieged.

In the month of April in the succeeding year, the forces of the congregation again invested the town, being now aided by an army of 6000 men under Lord Grey of Wilton, which had been dispatched to their assistance by Elizabeth. On this occasion the contest was protracted and sanguinary, hundreds falling on both sides in the fierce assaults and sallies which were daily made by the besiegers and besieged respectively. For two months, during which the town suffered dreadfully from famine, as well as from the more violent casualties of war, the struggle continued, without any decisive advantage being gained by either side. At the end of that period, however, both parties being heartily tired of the contest, a treaty was entered into, by which it was stipulated that the French should evacuate the kingdom, that they should be allowed to embark unmolested, and that the English army should, upon the same day, begin its march to England. Immediately after the conclusion of this treaty, the walls of Leith were demolished by order of the town-council of Edinburgh, and no vestige of them now remains. The town, however, was temporarily re-fortified by the Earl of Morton during the regency of the Earl of Lennox, by whom it was constituted the head-quarters of the king's faction, and was thus once more involved in the miseries of war. Some new fortifications were shortly afterwards erected around it by the regent himself, who came to reside there, holding his court in the town, and making it the general rendezvous for the friends of his party.

In giving this chronological sketch of the most remarkable events which distinguish Leith, it would be a defect to omit noticing the landing, at that port, of the unfortunate Queen Mary, when she came from France to take possession of the throne of her ancestors. This event took place on the morning of the 20th of August 1561, between the hours of seven and eight o'clock. She landed upon the pier; but that pier has long since ceased to exist.

In 1643 the solemn league and covenant was signed by the inhabitants of Leith with great solemnity. Two years afterwards, the unhappy town was visited by the plague, by which it was nearly depopulated. Many melancholy memorials of this dreadful calamity have, up to a late period, been found in its vicinity; amongst these, quantities of half-decayed bones wrapped up in blankets, the remains of its unfortunate victims, for whom there was not room in the church-yard, nor time to provide them with the usual decencies of sepulture.

The next remarkable period in the annals of Leith is the year 1650, when it was taken possession of by Cromwell, and subjected to a monthly assessment of about L.22 sterling, besides the proportion of an exaction of L.2400 Scots, which was levied by the conqueror on Edinburgh and the vicinity, including Leith, immediately on his arrival. Upon Cromwell's return to England, General Monk, who was appointed commander-in-chief in Scotland, took up his residence in Leith, where he constructed a strong fort, and established a regular garrison. Some portions of this fort or citadel still remain, including the house in which Monk himself resided. The former was of a pentagonal shape, and consisted of five bastions, with one principal gate fronting the east. The expense of the whole was L.10,000 sterling. Whilst resident in Leith, Monk induced a number of respectable English families to come down and settle in the town. These introduced with their wealth a spirit of mercantile adventure, besides establishing certain branches of manufacture that greatly benefited the town, and laid the foundation of much of the prosperity which it has since enjoyed.

In 1715, the citadel was taken possession of by a party of the adherents of the Stuart family, headed by one Mackintosh of Borlum; but, being threatened by the Duke of Argyll, who was then in Edinburgh, with a strong military force, he evacuated the fort after dark, availing himself of low-water to march his men over the sands, upon which the citadel opened to the seaward; and with this event terminates the military history of Leith.

For a long period Leith was celebrated for its horse-races. These were held during the recess of the tide, on a large tract of sand lying on the east side of the town, and were first established at the Restoration. Though far inferior to a regular race-course, on account of the wetness of the sand, which rendered it exceedingly bad footing for the horses, these races were long celebrated with a spirit, and accompanied by a feeling of satisfaction and universal joy, which is rarely witnessed on similar occasions at other places. The race-week was, indeed, considered as a sort of carnival by the citizens of Edinburgh, which during its continuance was crowded by persons of rank and fashion from all parts of the kingdom. The races were removed, in 1816, to the Links of Musselburgh, a distance of about six miles, where the ground is much better adapted for this pastime.

Leith, though, as already stated, a pretty ancient town, has not many antiquities of a very marked character to boast of; modern improvement having swept them nearly all away. Amongst the few of any note that remain is the parish church of South Leith, a fine old Gothic edifice, though of comparatively but small dimensions. The precise date of the erection of this structure is not known; but it is certain that it was built previous to the year 1496. Of the ancient pier, the pier on which the ill-fated Mary landed in 1561, nothing now remains but a few blackened stumps, which have been seen protruding through the sand a little to the eastward of the present pier; but, from the frequent shifting of the former, they are rarely visible, and have now, we believe, disappeared altogether. Upon the south-east side of the town, on extensive downs, or, as they are called in Scotland, links, are several mounds, which were raised by the besieging army in 1560, and crowned with cannon. These are still entire, and, to all appearance, precisely in the same state in which they were left by those who constructed them. The only other piece of antiquity that remains to be noticed is the old church of North Leith. This ancient structure was founded in the year 1493, and was dedicated to St Ninian. It was long the parish church of North Leith, but has now been for many years disused for religious purposes. To these memorials of other times may be added a few private houses situated in the oldest parts of the town, which, though now, for the most part, in a dilapidated state, and inhabited by the poorest classes, bear evident marks of having been once of no small consideration. Amongst the ancient buildings of note that have disappeared may be mentioned, 1*st*, an ancient monastery, founded in 1435, and dedicated to St Anthony; its monks were of the order of St Augustin; the establishment, which was a very extensive and magnificent one, was situated at the head of the Kirkgate, but no trace of it remains, excepting some vaults, now included in the premises of a brewer. 2*d*, The King's Work, a building of great antiquity, and on good grounds believed to have been a royal residence; it was situated at the foot of Bernard Street, or rather between that street and the Broad Wynd; but all vestige of it has long since disappeared. 3*d*, The old Tolbooth was erected in 1565, and occupied the site of the present structure. 4*th*, Trinity-House, a very old building, stood where the modern house stands. *Lastly*, King James's Hospital; this edifice, now entirely removed, stood on the east side of the Kirkgate; it was founded by the church-session of South Leith in 1614, and endowed with certain lands and tenements belonging to the preceptory of St Anthony. Of the ancient pier, and of the walls and citadel, we have spoken elsewhere.

Leith is divided into the parishes of North and South Leith, the division being marked by the Water of Leith, which intersects the town. The greater and principal part of the latter, however, stands on the south side, where the chief business of the place is conducted. The town altogether may be about from one mile and a half to two miles in circumference; but, as it is in various places straggling and detached, it occupies more ground than would bear a fair proportion to its population. It is for the most part irregularly and confusedly built, and a great portion of it is extremely filthy, crowded, and inelegant. Some parts of it, again, are the reverse of this, being spacious, cleanly, and handsome. Such are two or three of the modern streets, and various ranges of private dwellings erected of late years on the eastern and western skirts of the town. Many of these, indeed, occupy situations and command views of so pleasant a character as to render them very desirable places of residence. The modern public buildings of Leith worthy of remark are, the Exchange Buildings, a large and elegant structure in the Grecian style of architecture; they contain a spacious and handsome assembly-room, a commodious hotel, and public reading-room, and the expense of the erection was L.16,000: the Custom-house, situated in North Leith, is also a very splendid building; it was erected in 1812, at an expense of L.12,000: the Leith Bank, a neat little edifice, erected in 1805–6: the new Court-house, by far the most elegant building in the town, and forming altogether, whether the chasteness of the design or the neatness of the workmanship be considered, a very favourable specimen of modern architecture on a small scale. The grammar school is a spacious building, of an oblong figure, in the Grecian style, erected in 1805–6.

Sea-field Baths.—These are situated at the distance of about half a mile from the town. They were erected in 1813, at an expense of L.8000, raised in shares of fifty guineas each. The building is large and handsome, and, besides the baths, contains a hotel; but it has not been a thriving speculation. The Trinity-House is another handsome though small edifice, in the Grecian style. It was erected in the year 1817, at an expense of L.2500. The Tolbooth is a new structure, in the Saxon style of architecture. It has several suits of well-lighted apartments; but, never having been legalized, is not used as a jail, the new court-house being employed for that purpose, although only as a place of temporary confinement, offenders against the laws being sent as soon as possible to Edinburgh. The Markets of Leith are both spacious and handsome. They were erected in 1819, and include a butcher-market, which is of an octangular form, surrounded with neatly-fitted up stalls, well lighted with gas; a fish-market; and poultry and vegetable markets.

The ecclesiastical statistics of Leith include the parish church of South Leith, which has been already spoken of. This charge is collegiate, one of the two ministers being appointed by the crown, the other by the magistrates and incorporated trades. It became the parochial place of worship in 1609, and was originally dedicated to St Mary. This parish has a chapel of ease of spacious dimensions. The parish church of North Leith is an exceedingly handsome though plain structure, surmounted by a lofty and tasteful spire. The stipend of the clergyman, who is appointed by the inhabitants, is reckoned one of the best in the Church of Scotland, and includes the tithe, now commuted into money, of all fish landed on the beach. To these fall to be added a neat though small English chapel, one Methodist, one Relief, one Independent, and three United Secession churches, capable altogether of containing, including the two parish churches and chapel of ease, upwards of 10,000 persons.

The charitable institutions of Leith are, a female society for relieving indigent and sick women; a society for relieving the destitute sick; the sympathetic society; a female school of industry; and a charity school for boys. To these may be added the Trinity-House, formed on the usual principles, for the relief of indigent or superannuated mariners.

The chief manufactures of Leith are ropes and cordage, sail-cloth, bottles, soap, and candles. Ship-building is also carried on there to a considerable extent. There are likewise several breweries, a distillery, and an extensive sugar-refining establishment. Crown-glass was also till lately manufactured there on a large scale; but not having been found a profitable speculation, it has been abandoned.

Hitherto we have treated of Leith merely as a town: we shall now proceed to consider it as a sea-port. For this it possesses no natural advantages; and the consequence has been a perpetual struggle, attended with enormous expense, to supply its deficiencies by works of art, and hitherto without by any means attaining fully either the objects aimed at, or a commensurate benefit for the outlay incurred.

The trade of Leith, as we have elsewhere said, has been considerable for several centuries past; but notwithstanding this, it was not till the year 1720 that any thing of importance was done for the improvement of its harbour. In that year a dock was formed on the east side of it, and that part of the present pier which is of stone erected. Fifty-seven years after this (for so long an interval occurred before any other improvement was attempted), a small quay, called the custom-house quay, was built; but these trifling accommodations being found wholly inadequate to the increasing demands of the port, the city of Edinburgh, in the year 1799, obtained an act of parliament authorizing them to borrow L.160,000, to enable them to form the present superb wet-docks designed by Mr John Rennie, civil engineer. These docks, of which there are two, were begun in the year 1800, and were completed in 1817. Each of them measures 250 yards in length and 100 in breadth, and both include a space equal to 10¼ English acres. On the northern side are three graving docks, each 136 feet long and forty-five wide at bottom, and 150 feet long by seventy feet wide at the top, with an entrance of the width of thirty-six feet. The whole of these works are protected from the sea by a strong retaining wall. At average spring tides the depth of water in the wet-docks is sixteen feet nine inches; and at average neap tides, twelve feet nine inches. They are lined on the south side by a row of lofty and spacious warehouses for bonding and storing foreign liquors and other goods.

The expense of these works amounted altogether to about L.285,000, of which L.265,000 was subsequently borrowed by the city of Edinburgh from government, at the rate of five per cent. interest, of which three per cent. was to be the rate of interest payable annually, and two per cent. to go to a sinking fund. This rate of interest, however, was, for certain considerations, reduced to four per cent. for twelve years. The security given by the city for this loan was a preferable claim on the whole of their Leith property, and a concurrent claim with other creditors over the entire property of the city of Edinburgh, besides ceding a part of the docks and shire-ground to the admiralty. Of this debt the sinking-fund cleared off about L.25,000, but subsequent arrears have left it nearly in its original state.

Since the improvements above mentioned were effected, another has taken place in the extension of the pier, and in the formation of a covering bulwark; the former at the expense (L.28,000) of the city of Edinburgh, the latter (L.12,000) at that of government. The addition which has been made to the length of the pier is 2550 feet, making it altogether upwards of half a mile in length. The object proposed by this extension, and the erection of the bulwark, was to increase the depth of water in the channel, an effect which it has had to the extent of about two feet.

It would appear, however, that the natural disadvantages of Leith are so great, and of so irremediable a character, that no ingenuity nor expense can ever wholly overcome them, or make it more than a mere tidal harbour, and even as that, but a very indifferent one. At present, notwithstanding all that has been done for it, it will not at any time admit of vessels of more than 400 tons, and not always of ships approaching that burthen; circumstances which, when added to its heavy charges, must always greatly limit its prosperity.

The collection of the revenues of the docks and harbour of Leith is in the hands of the corporation of Edinburgh, and the business of management is invested in a commission, formed by persons nominated both by Edinburgh and by Leith.

The general trade of the port has of late years been, upon the whole, rather on the decrease. In 1826 the tonnage belonging to Leith was 25,674 tons; in 1832, 23,094 tons; in 1835, 22,073 tons; thus showing a progressive decay. At one time it enjoyed nearly all the Baltic trade in the east of Scotland, but a great portion of this has now found its way to Kirkcaldy, Dundee, and Aberdeen. During the war, too, it was the principal naval station to which prizes were brought for condemnation; a source of benefit which it has likewise lost. Like many other towns also, it has suffered severely by foreign speculations; but, unlike some of these, it seems never to have entirely recovered from its misfortunes.

The opening of the Union Canal has likewise operated unfavourably for Leith, in as far, in particular, as regards its coal trade, of which it has deprived it of nearly one half. The quantity of this article formerly brought into Leith averaged about 57,000 tons annually. It does not at present much exceed 33,000. A branch railway, however, is now being introduced into Leith from Musselburgh and other places, which may have the effect of improving this department of its trade.

Leith enjoys a small West India trade, chiefly carried on by Glasgow merchants. This trade, again, is improving, and now employs shipping to the amount of 1768 tons, being an increase of upwards of 1000 tons within the last ten years. At some previous periods, however, it has employed an amount nearly equal to the former.

The coasting trade of Leith is still pretty extensive, and its foreign trade, particularly with the north of Europe, considerable. The chief imports in the latter are cheese, bark, hides, tallow, timber, rags, and flax. Large quantities of wine and tobacco are also imported into Leith.

The following tables will give a correct idea of the amount of the trade of the port, with its fluctuations; in the one case, during the last ten years; in the other, during three parts of a century.

Account of Dues levied on Shipping and Goods at Leith from 1825 *to* 1835, *both inclusive.*

Years.	On Vessels.			On Goods Imported.			On Goods Exported.			Total Amount.

The feus, rents, and other revenues at the wet docks, for the year 1836, amounted to L.3108. 19s. 3½d.

Amount of Shipping entering Leith since 1760.

Years.	Tons.
1760	34,000
1770	66,000
1781	63,000
1788	117,000
1801	186,000
1810	266,000
1815	257,000
1818	341,000
1821	312,000
1824	342,000
1827	365,000
1830	308,000
1832	309,000
1834	340,000
1835	340,540

The want of a sufficient depth of water, as has been elsewhere remarked, is one of the great disadvantages under which Leith labours. At present, after all that has been done to remedy this evil, there are only seventeen feet water on the bar at high water during spring-tides, and only fourteen during neap tides. The depth of water is indicated to vessels approaching, or at anchor in the roads, from a small light-house erected on the pier, by a train of signals during the day, and at night by a stationary light, which is exhibited whilst there are nine feet water on the bar.

Vessels that do not choose to enter the harbour, or that cannot enter it in consequence of drawing too much water, anchor in the roads off the town, at the distance of about a mile and a half or two miles, where they have from four to six fathoms water, with good anchorage ground.

There are three companies belonging to the town, engaged in the London and Leith trade, who have altogether eighteen vessels in constant intercourse with the two ports. One of these companies has, besides, three large steamships for passengers and goods in the same trade. There is also a company in the Leith and Hull trade, with five vessels; a company in the Liverpool and Leith trade, with five vessels; a company in the Leith and Newcastle trade, with four vessels; one in the Hamburg and Rotterdam trade, with eight vessels; one in the Aberdeen trade, with four vessels; one in the Inverness trade, with two vessels; one in the trade with Wick, with two vessels; one in the Helmsdale trade, with one vessel; one in the Greenock trade, with four vessels; besides companies which trade with different parts of Fife, with Dundee, Stirling, and other places. To these may be added, a Newcastle steamer, which sails once a week in winter, and twice a week in summer; two regular traders to Peterhead, one to Berwick, and one to Banff.

There are five vessels belonging to the port, engaged in the Greenland trade. Formerly, that is, within these three or four years, there were seven, but they are now reduced to the number stated.

The municipal government of Leith was formerly vested virtually, and at an earlier period literally, in the town council of Edinburgh, which exercised an uncontrolled judicial authority over the town and suburbs. But by a bill William 3 and 4, cap. 77, passed on the 28th August 1833, and which came into operation on the first Tuesday of November following, Leith was rendered wholly independent of the city of Edinburgh in the constitution and exercise of its municipal government, the latter being invested in a provost, four bailies, and twenty-five councillors, with their officers, to be chosen by the inhabitants by popular election.

The judicial authority of Edinburgh over Leith, therefore, is now entirely abolished, and the former discharged from interfering with or exercising any control over the affairs of the town. This, however, does not extend to the city's rights in the harbour and docks, nor to the revenues arising therefrom, which remain untouched. The provost and treasurer remain each three years in office, whilst the councillors go out by a special order of rotation specified in the act.

By the same act the admiralty jurisdiction, which was formerly invested in the council of Edinburgh, has been transferred to the provost and magistrates of Leith; the former being admiral, and the latter depute-admirals, inheriting all the rights, power, and privileges connected with this jurisdiction enjoyed by the body by which it was formerly exercised.

Leith has also a resident sheriff-substitute, an officer of recent appointment, who holds a small debt court every Friday. This functionary, whose salary is L.200 per annum, is paid out of the funds of the burgh; but this burden on the latter ceases with the death or removal of the present incumbent, Leith being declared relieved in such case from all charge for any future sheriff-substitute that may be appointed. Leith, together with Musselburgh, including Fisherrow, Portobello, and Newhaven, returns a member to parliament. The town is lighted with coal-gas, manufactured there by a joint-stock company; and is supplied with water by a branch of the pipes by which Edinburgh is furnished with that article.

The town's expenses are defrayed by a heavy assessment upon the inhabitants. Neither literature nor the fine arts are much cultivated in Leith. A laudable and successful attempt, however, has been made to introduce at least one branch of the latter, viz. music. In 1830, a Philharmonic Society was instituted, which has since acquired considerable celebrity. There are also two public subscription libraries, and a mechanics' institution, with a library and lecture-room, in the Exchange Buildings.

Having concluded our sketch of Leith, we have only to add, that we have studiously avoided all allusion to the protracted disputes in which it has been engaged with the city of Edinburgh, not thinking these fit matter for a work of this nature. The population of the parishes of North and South Leith in 1831 was 26,000, and is now estimated at 30,000.

LEITOMISCHEL, a city of the circle of Chrudim, in the Austrian kingdom of Bohemia. It stands on the river Lauzna, and contains 634 houses, with 4653 inhabitants, who are occupied in making muslins and other cotton goods, and in distilleries. There is a college with six professors, and a gymnasium or public classical school.

LEITRIM, a maritime county of the province of Connaught, in Ireland, is bounded on the north by the Atlantic and the counties of Donegal and Fermanagh, on the east by the counties of Fermanagh and Cavan, on the south by those of Longford and Roscommon, and on the west by Roscommon and Sligo. In shape it has been compared to an hour-glass, broad at both ends, and contracted in the middle. Its greatest length, measured from south-east to north-west, is fifty-two miles; its breadth where broadest is twenty, and where narrowest not more than seven miles; extending over an area of 420,375 acres, of which 266,640, or little more than one half, are cultivated land, 128,167 are bog or unimproveable mountain, and 25,568 are under water.

The county, which derives its name from an obscure village on the Shannon, is supposed to have formed part of the region inhabited by the tribe of the Nagnatæ in the time of Ptolemy. The Irish chroniclers distinguish it by the name of Hy-Brune-Brefinc, or Brennie. The family of O'Ruarck, which derived its descent from Roderic, king of Ireland, held in it the rank of chieftain; and under him were those of O'Murrey, M'Loghlin, M'Glanchie, and

M'Granell. It was made shire-ground, together with the other counties in Connaught, by Queen Elizabeth; and is now divided into the five baronies of Carrigallon, Dromahaire, Leitrim, Mohill, and Rosclogher. These baronies are subdivided into seventeen parishes, of which ten are in the diocese of Kilmore, and seven in that of Ardagh. For the greater convenience of transacting the sessional business of the county, it is divided into two districts; that of Manor-Hamilton in the north, comprising the baronies of Rosclogher and Dromahaire; and that of Carrick-on-Shannon to the south, comprehending the three southern baronies.

The climate is not only colder than the more southern counties, but also moister, owing to the number and height of the mountains with which the greater part of its surface is overspread. The whole of the northern part of the county is mountainous. Lugnaquilla, the most elevated of the mountains, rises to the height of 1485 feet; Benbo is 1403 feet high; Lacka, 1315; the Green Mountain, 950 feet. More southerly are Slieve-an-Eirin and Bencroi. Large tracts of ground comparatively level are to be found in the southern part of the county, the greater part of which is well wooded, fertile, and abounding in picturesque scenery. The soil in general is stiff, heavy, cold, and wet. The tops and sides of most of the hills are covered with a thin ferruginous loam, based upon a hard gravel. The valleys, which are in general well watered, are of a quality superior to the hills, deeper in mould, and much more fertile. The more level tracts, already noticed, are a dark rich soil on a limestone bottom.

The county is not more remarkable for its mountains than for its lakes. The principal is Lough Allen, situated in its centre, where narrowest. It is eight miles long from north to south, and four where broadest, and may be looked upon as the great reservoir and distributer of all the running water in the county, and the embryo feeder of every canal that may be made to traverse it. Storms on this lake are violent, and the waves run very high. The boatmen who navigate it assert that it is unfathomable in some parts. A few miles to the north is Lough Clean, or Belhovel Lake, which discharges its waters into Lough Allen by a stream of some magnitude. Several smaller sheets of water are scattered throughout the southern baronies. On the borders are Lough Gill, Lough Melvyn, Lough Cane, and Lough Boffin. The Shannon is said by some writers to take its rise in Lough Clean, but its source is more generally reputed to be in Quilca Mountain, where it is known by the name of Avonmore, or the Great River, to distinguish it from the many lesser streams that, like it, contribute to feed the great central lake. Issuing from the southern extremity of Lough Allen, it forms the western boundary of the county. The Bonnet rises near Lough Clean, and falls into Lough Gilly. The small rivers Bundrows and Brinduff, which separate Leitrim from Donegal and Sligo, contain between their mouths the scanty line of three miles of sea-coast belonging to the county. Many other streams, too small to be particularly noticed, and discharging themselves into some of the numerous lakes or larger rivers, afford a copious and perennial supply of water.

The central parts of the county form part of the great coal-fields of Ireland. The principal vein is in Bencroi Mountain, the summit of which is bog. The works originally belonged to the O'Reillys, from whom they devolved by mortgage to one of the Latouche family, who, after a very great expenditure, relinquished them. The coal is not considered as of good quality. Coal has also been found in the hill of Lacka, and in Lugnaquilla, where it crops out at an elevation of about 1170 feet above the sea level, at Meneask. Iron-ore abounds in the Slieve-na-Eirin, or Iron Mountain. On its northern side, where the interior has been denuded by the mountain floods, the metal shows itself in large quantities, alternating with strata of limestone. The ore here is considered as richer than that of Roscommon. It was worked until the failure of timber and the want of a sufficient supply of mineral coal put a stop to the operations. Indications of the same ore are to be found in several other parts of the mountainous district, and even in the interior of the plain country, near the Shannon. Indeed the soil is so deeply and extensively impregnated with it, that the inhabitants, who have not the means of rendering it profitable, denounce it as the bane of the country. Lead has been found near Lurganboy. Upon the north side of Benbo Mountain are pits whence copper has been extracted. Manganese is also found in large quantities, as is pipe clay, yellow ochre, white and brown chalks, clays of various hues, and sand suited for the manufacture of glass. The substratum of the parts of the county north and south of the coal and iron district is chiefly limestone, interspersed occasionally with sandstone. Benbo is granitic. The quantity of bog is estimated to occupy 7234 acres. Its general depth is thirty feet, and it rests on a stratum of marl or blue clay. The highest level of any of the bogs above the Shannon at Lough Reagh is 114 feet, that of the lowest twenty-nine. All are so far elevated as to admit of drainage. There is a sulphureous spa at Drumsna, in high repute for cutaneous disorders, and by many considered as more effective than that of Swadlinbar. There are also others of the same quality at Annaghduff, Meelock, and Attymanus, and in some other places. Cavan spa is a chalybeate, issuing from the southern part of a peninsula in the north of Lough Allen. Oakfield spa, likewise chalybeate, is near the sea. Both are visited for their supposed sanative qualities.

The population, like that of every other part of Ireland, has been progressively on the increase ever since any series of systematic observations have been directed to ascertain it. The following are the most important epochs of its increase:—

1760	De Burgho	26,142
1792	Beaufort	50,000
1813	Parliamentary census	94,095
1821	Ditto	124,785
1831	Ditto	141,303

The foregoing table exhibits an increase upwards of quintuple in seventy years. But it is to be observed, that the ratio of increase between the first and last parliamentary census, which may be deemed to have been taken with greater accuracy than those of former years, which rest chiefly on conjectural computation, does not establish the authenticity of such a rapid increase. The average of population to the superficial contents of the county gives a rate of one inhabitant to one acre and eighty-eight hundred parts.

This population was represented in the Irish House of Commons by six members, two for the county at large, and two for each of the close boroughs of Carrick-on-Shannon and Jamestown. The union struck off the borough representatives, and as no change has been made in this point by the reform act, the county now sends but two members to the imperial parliament. The state of the constituency, as affected by the legislative alterations made since the passing of the Catholic emancipation bill, by which the right of the forty-shilling freeholders to vote in the election of representatives was abolished, exhibits the following results:—

Date.	L.50.	L.20.	L.10.	40s.	Total.
Jan. 1829,	174	86	—	6101	6361
Jan. 1830,	196	128	278	—	602
Jan. 1832,	156	144	1018	—	1318

Hence it appears, that whilst, previously to the extinction of the forty-shilling freeholders, there was one elector for every four families nearly, the number was reduced, after the change, to one for every eighteen.

The state of crime may be estimated, to a certain degree, from the following return of the numbers committed for criminal offences during the seven years ending December 1834, viz:—

1828	380	1832	293
1829	372	1833	389
1830	282	1834	330
1831	209		

The foregoing statement is taken from the annual report of the inspectors-general of prisons. Another return from the county officers gives the following result for the year 1834, which is both more specific, and varies from the other in no small degree as to the number of committals. The great excess of persons discharged unpunished above those convicted presents a very extraordinary characteristic as to the administration of justice in this, as in many other counties. Capital executions are very uncommon here.

Committals in 1834	628
Convictions	109
Acquittals by jury	153
No bills found	66
No prosecution	208
Bailed and not tried	5
Remaining for trial	87
Total not convicted	519

The state of public education, as collected from the parliamentary inquiries in 1821 and 1824–26, may be inferred from the following table. The information on this interesting topic, collected by the late commission of public instruction, having been made up according to dioceses, instead of counties, as had been the case in the preceding parliamentary returns, precludes the possibility of giving a statement either of the numbers of children receiving instruction, or of the comparative amount of the different religious persuasions, for the year 1834.

Year.	Boys.	Girls.	Sex not ascertained.	Total.
1821,	3580	1609	—	5,189
1824–6,	6736	3627	770	11,135

Of the numbers in the latter of these returns, 2147 were of the established church, twenty-seven were dissenters, 7757 Roman catholics, and 1204 whose religious persuasion could not be ascertained. The total number of schools was 242, of which twenty-one, educating 1181 pupils, were maintained by grants of public money; sixty-four, educating 3113, derived their support from private contributions; and the remaining 157 schools, educating 6841 pupils, were supported wholly by the fees of those who received instruction in them.

The quantity of land under tillage is small, and the plough little used excepting in the champaign districts. In the other parts the mode of culture is by the loy, a narrow spade with a long handle. The hills are generally steep, and, though abounding with stones, are tough, and retentive of moisture. The loy penetrates into this species of soil more easily than the common broad spade, and the length of its handle serves as a lever to overcome the resistance of the tenacious soil. Potatoes are planted with a steveen, which is a stake about four feet long and three inches in diameter, tapering to a point at the lower end, near which a cross piece is fixed to rest the foot on whilst pressing the implement into the ground. The seed is dropped into the hole thus made, which is then filled up with mould. Oats are the general crop; barley is but little grown; rye and wheat still less. Flax forms a part of the usual rotation of crops. Tillage farms are small; those for grazing are of considerable size, and often held by several tenants in common. The grasses are mostly natural, and in general excellent, producing fat and well-flavoured meat, and excellent milk and butter. Dairies of large size are seldom to be met with, but every small farmer produces butter to dispose of at some of the neighbouring markets. Green food is seldom used. The cattle are housed in some parts from December to May, whilst in others they are left out during the winter. The usual fence is a drain, backed at one side with a bank of clammy aluminous earth, about three or four feet high. The ditch thus made soon hardens into a consistency nearly equal to brick, and answers every purpose of fencing except against sheep, in which case it is topped with brushwood. Stone-walls are few. Hawthorn hedges are to be met with in some parts. Manures are rich and abundant. Every part has a command of limestone, either solid, or in gravel or marl. The farmers living upon the confined verge of sea-coast within the county industriously take advantage of the sea-weeds, shells, and gravel found there. Much attention is paid to the collection of every kind of manure. The farm-houses are generally long, narrow buildings, of one story high, with a yard before them, of which the offices form the sides. The repairs are always made by the landlord, a custom very uncommon in other counties. Leases are generally for three lives, or thirty-one years. Non-alienation clauses are common, and the tenant is sometimes bound down to manure a certain portion of the land.

The manufactures are confined to that of coarse linen, the weaving of which is carried on to a considerable extent. Potteries of coarse vessels are numerous about Leitrim and Dromahaire. The only navigable river by which an inland trade can be carried on is the Shannon. About fifty years ago a canal was opened from near Longford to Battlebridge, about three miles south of Lough Allen, in order to form a water communication thence to Limerick. This canal, if completed to the lough, would enable boats to ply thence to Dublin by its connection with the Royal Canal at Tarmenbarry. There are no fisheries of any consequence, although many kinds of fresh-water fish, particularly perch, may be caught in great abundance.

The general food of the peasantry is potatoes and oaten bread, with butter and eggs occasionally, and flesh meat at the great festivals. The clothing is neat, clean, and substantial; the coat usually of native frize, and the waistcoat and breeches of corduroy. In their general demeanour the peasantry are kind, warm-hearted, and amenable to the laws. They are, like those of most other parts of Ireland, singularly attached to peculiar places of interment. One of the most frequented of these is on a small island near the entrance of the Shannon into Lough Neagh, where there are the remains of a church. It has been from time immemorial the burying-place for the residents in all the surrounding country; and when access to it is prevented on such occasions, by the stormy state of the lake, the friends of the deceased prefer remaining on the shore by the putrefying corpse, until the weather become favourable enough to permit a passage across, to removing it for interment elsewhere. The frequent occurrence of fatal accidents in these funereal voyages induced a neighbouring gentleman to have a piece of ground upon the adjoining mainland consecrated as a cemetery, but to no purpose. The survivors preferred awaiting all chances of weather rather than relinquish the idea of depositing the bones of their departed friend with those of his forefathers. The mountainous districts are thickly peopled, but have few resident proprietors. The lowest classes there speak Irish. They have a singular custom, when they have recourse to blood-letting, of opening a vein in each arm, in order to let the blood run even. Dancing is the favourite amusement in convivial meetings; every one is fond of displaying his agility in this enlivening exercise. At weddings the men ride to the place of worship, each horseman having a woman behind him, except the bridegroom, who rides single. When a person is seen riding on a pyebald horse, it is considered as a sign that he is a physician. The cabin-doors in these districts are of wicker-work, lined in the inside by a mat. The harness for the cattle is exceedingly rude, being little more than a hay rope or band. The people in the neighbourhood of the iron-works appear to live in a state of extreme misery. They are wretchedly clothed, and dwell in mud houses filled with smoke. The vicinity of the three counties of Leitrim, Cavan, and Sligo to each other, gives occasion to party feuds, which often lead to desperate battles between hostile clans or factions, that never terminate without bloodshed, and not unfrequently with loss of life.

There are but few remains of ancient Irish antiquities. The most remarkable are two druidical altars; one very large near Fenagh, the other of smaller dimensions at Letterfyan. They are called by the natives Leaba Dearmud is Graine, or Darby's and Graine's bed. The principal monastic buildings of which any vestiges can now be traced, are the following. Crevlea, near the river Bonnet, built by Margaret, widow of O'Ruarck, in 1509. The walls, which are nearly entire, have on them some curious figures, and contain several antique monuments. Fionagh, in Fenagh parish, still exhibits a window of fine workmanship: the place was anciently celebrated as a school of divinity, and was resorted to by students from many parts of Europe. A Franciscan friary, at Jamestown, was remarkable in the eventful period of 1641, as being the place where the Roman Catholic clergy assembled, and nominated commissioners to treat with such foreign powers as were willing to assist them in their struggle against the usurped authorities which then governed England. Clone, near a small river of the same name in Mohill barony, has still some ruins to point out its site. Mohill Abbey, Annaghduff, and Drumleas, have been converted into parish churches. Some others are known only by name. Amongst the military antiquities may be noticed O'Rorke's Hall, at Dromahaire, near the Bonnet, the destruction of which was expedited by using its materials for the construction of the neighbouring castle of Dromahaire, supposed to have been built by Sir William Villiers in the year 1628. Other castles, built by various members of the O'Ruarck family, are those of Longfield, Cloncorrick, Castle Cor, and one on the banks of Lough Gill. Woodford House is built on the site of another of the O'Ruarcks' castles. Manor-Hamilton Castle, built by Sir Frederick Hamilton, in the reign of Elizabeth, is by much the largest, best built, and handsomest in the county. Castle John stands on an island in the little lake of Lough Scur. Dungarbery Castle, near the sea, is of the era of Elizabeth.

The population of Leitrim may be said to be wholly rural: no town in it contains two thousand inhabitants. Carrick-on-Shannon, the county town, where the assizes are held, and all the public business transacted, contains no more than 1428 inhabitants. Though well circumstanced for inland trade, from its situation on a fine navigable river, no advantage has been taken of its position. Its only public buildings are a court-house, a jail, a chapel of ease, and a barrack. The mail-coach road to Sligo passes through it. The only other towns whose population exceeds a thousand souls are, Mohill, which contains 1606, and Manor-Hamilton, which has 1348 inhabitants.

LEIXLIP, a post and fair town of Ireland, pleasantly situated in the county of Kildare and province of Leinster, about eight miles from Dublin. Near it are the ruins of the church and castle of Confy. The castle of Leixlip is beautifully situated on the banks of the river Liffey. It is a fine edifice, with large and pleasant gardens, at one side of which is a fine waterfall called the *Salmon leap*, there being plenty of that species of fish hereabouts. A mile from this is Castletown, the magnificent seat of Mr Conolly.

LELAND, John, an eminent English antiquarian, was born in London about the year 1507. Having lost his parents when a child, he had the good fortune to find a friend and patron in a Mr Thomas Myles, who placed him in St Paul's school, of which the grammarian William Lilly was master. From that school he was sent to Christ's College, Cambridge, whence, after some years' residence, he removed to All Souls, Oxford. From Oxford he went to Paris, chiefly with a design to study the Greek language, which at that time was but little understood in this kingdom. Upon his return to England he took orders, and was soon afterwards appointed chaplain to King Henry VIII., who also gave him the rectory of Poppeling, in the marches of Calais; appointed him his librarian; and in 1533 granted to him, by commission under the great seal, the office of king's antiquary, an office never borne by any other person before or since. By this commission he was empowered to search for ancient writings in all the libraries of abbeys, priories, colleges, cathedrals, and places where "records, writings, and secrets of antiquity were reposited" in his majesty's dominions. We are informed by one of his biographers, that he renounced popery soon after his return to England; but no authority is quoted for his statement. Be this as it may, in 1536 he obtained a dispensation to keep a curate at Poppeling, and set out on his journey in quest of antiquities. In this employment he spent six years, during which time he visited every part of England where monuments of antiquity were expected to be found. After his return, in the year 1542, he was presented by the king to the rich rectory of Haseley in Oxfordshire; and in the following year Henry gave him a prebend of King's College, now Christ's Church, Oxford, besides that of East and West Knowle, in the cathedral of Salisbury. Being thus amply provided for, he retired to a house of his own in the parish of St Michael le Querne in London, where he spent six years more in digesting the materials which he had collected. Henry VIII. died in 1547; and in a short time afterwards poor Leland appears to have lost his senses. He was at first seized with a deep melancholy, which was succeeded by a total deprivation of reason. In this lamentable state he continued till the beginning of the year 1552, when he was happily released by death. He was buried in the church of St Michael le Querne, which was destroyed by the fire in 1666. Leland was a man of great learning, an accomplished linguist, and an indefatigable and skilful antiquarian. Upon his death, Edward VI. gave all Leland's papers to Sir John Cheke, his tutor, and Latin secretary of state. When this king died, Sir John, being obliged to leave the kingdom, gave to Mr Humphrey Purefoy four folio volumes of Leland's collections, which, in 1612, were transferred by his son to William Burton, author of the history of Leicestershire. This gentleman also became possessed of the Itinerary in eight vols. folio, which, in 1632, he deposited in the Bodleian Library. After the death of Sir John Cheke, many other of Leland's manuscripts fell into the hands of Lord Paget, Sir William Cecil, and others, and at last fortunately came into the possession of Sir John Cotton. These were of great use to all our succeeding antiquarians, particularly Camden, Dugdale, Stowe, Lambard, Batteley, and Antony Wood. His Itinerary throughout most parts of England and Wales was published by Mr Hearne, in nine vols. 8vo, 1710–1711; as was also his *Collectanea de Rebus Britannicis*, six vols. 8vo, 1715.

LELAND, *John*, a distinguished writer in defence of the Christian religion, was born at Wigan, Lancashire, in 1691, and descended of eminently pious and virtuous parents, who took the earliest care to season his mind with proper instructions. But, in his sixth year, the small-pox deprived him of his understanding and memory, and expunged all his former ideas. He continued in this deplorable state near twelve months, when his faculties seemed to spring up anew; and though he did not retain the least traces of any impressions made on him before the distemper, yet he now discovered a quick apprehension and strong memory. In a few years afterwards his parents settled in Dublin. When he was properly qualified by years and study, he was called to officiate as pastor to a congregation of Protestant dissenters in that city. He was an able and acceptable preacher, but his labours were not confined to the pulpit. The many attacks made on Christianity, and by some writers of no contemptible abilities, induced him to consider the subject with the greatest care, and the most faithful examination. Upon the most deliberate inquiry, the truth and divine original, as well as the excellence and importance, of Christianity, appeared to him so clear and certain, that he published answers to several authors who appeared successively in that cause. He was indeed a master in this controversy; and his View of the Deistical Writers that have appeared in England, is very greatly and deservedly esteemed. In the decline of life he published another laborious work on the Advantage and Necessity of the Christian Revelation, shown from the State of Religion in the ancient Heathen World, especially with respect to the Knowledge and Worship of the one true God, in two vols. 4to. This noble and extensive subject, the several parts of which have been slightly and occasionally handled by other writers, Leland treated at large with the greatest care, accuracy, and candour. In his View of the Deistical Writers, his cool and dispassionate manner of treating their arguments, and his solid confutation of them, have contributed much more to depress the cause of infidelity than the angry zeal of intemperate disputants. Besides his learning and abilities, his amiable temper, great modesty, and exemplary life, recommended his memory to general esteem and affection. He died in 1766.

LELEGEIS, the ancient name of Miletus, from the Leleges, the first inhabitants of it.

LELEGES, anciently a people of Asia, of Greek origin; the name denoting "a collection of people." They first occupied the islands; then passing over to the continent, they settled partly in Mysia, on the Sinus Adramyttenus, and partly in that part of Ionia next to Caria. There were also Leleges of Laconia. These went to the Trojan war with Altes their king. Achilles plundered their country, and obliged them to retire to the neighbourhood of Halicarnassus, where they fixed their habitation. The inhabitants of Laconia and of Megara also bore this name for some time, from Lelex, one of their kings.

LELY, Sir Peter, an eminent painter, was born in Westphalia in the year 1617. He was placed as a disciple with Peter Grebber at Haerlem; and in 1641 was induced, by the encouragement which Charles I. gave to the fine arts, to visit England. He became state-painter to Charles II., who knighted him; and being a gentleman as well as a painter, that king took pleasure in conversing with him. He practised portrait-painting, and succeeded so well that he was preferred to all his contemporaries. Hence he was so much engaged in business, that he was prevented from visiting Italy to finish the course of his studies. However, he made himself amends, by getting the best drawings, prints, and paintings, of the most celebrated Italian masters. Amongst these were the greater part of the Arundel collection, which he received from the family of that name, many pieces of which were sold after his death at prodigious rates, bearing upon them his usual mark. The advantage which he reaped from this collection, the best chosen of any one of his time, appears from the admirable style which he acquired by daily conversing with the works of those great masters. In his correct drawing and beautiful colouring, but more especially in the graceful airs of his heads, and the pleasing variety of his postures, together with the gentle and loose management of the draperies, he excelled most of his predecessors. Yet the critics remark, that he preserved in almost all his female faces a drowsy sweetness of the eyes peculiar to himself, and for which he is reckoned a mannerist. The hands of his portraits are remarkably fine and elegantly turned; and he frequently added landscapes in the back-grounds of his pictures, in a style peculiar to himself. He likewise excelled in crayon-painting. He was familiar with, and greatly respected by, persons of the greatest eminence in the kingdom. He became enamoured of a beautiful English lady, to whom he was some time afterwards married; and he purchased an estate at Kew, in the county of Surrey, to which he often retired in the latter part of his life. He died of apoplexy in 1680, at London, and was buried at Covent Garden Church, where there is a marble monument erected to his memory.

LEMBERG, a circle in the Austrian province of Gallicia, extending over 1090 square miles. It comprehends four cities, two market-towns, and 167 villages, with 18,551 houses, inhabited by 140,468 individuals, of whom 18,550 are Jews. The capital of the circle, as of the province, is a city of the same name, but recently has assumed the name of Lopoldstadt. It is situated on the river Peltew, which runs into the Vistula. It is surrounded with gentle elevations, in a fertile district, and, though antique, is well built, especially in the suburbs. It contains a Catholic, an Arminian, and a Greek cathedral, with eleven other churches, nine monasteries, and a Lutheran chapel. There are, in 2515 houses, 41,490 inhabitants. It is a place of considerable trade, which is chiefly in the hands of the Jews. There are some manufactures of linen and woollen cloth, of ribbons, turnery ware, and musical instruments; but the trade rather arises from its being the seat of government, than from any productions of internal creation. There is a university with no less than twenty-six professors, and an academy with six teachers. There is also a public library, much increased of late years. It is in long. 24. 3. 20. E. and lat. 49. 51. 42. N.

LEMERY, Nicholas, a celebrated chemist, born at Rouen, in Normandy, in 1645. After having made the tour of France, he, in 1672, commenced an acquaintance with Martyn, apothecary to the prince, and performed several courses of chemistry in the laboratory of this chemist, at the Hôtel de Condé, which were the means of making him known to the prince. He provided himself at length with a laboratory of his own, and might have been created a doctor of physic; but he chose to continue an apothecary, from his attachment to chemistry. He opened public lectures on that subject; and his confluence of scholars was so great as scarcely to allow him room to perform his operations. The true principles of chemistry were but ill understood in his time. Lemery was the first who abolished the senseless jargon of barbarous terms, reduced the science to clear and simple ideas, and promised nothing which he did not perform. In 1681 he was disturbed on account of his religion, and came to England, where he was well received by Charles II.; but affairs not promising him the tranquillity he had sought for, he returned to France, and took shelter under a doctor's degree. The revocation of the edict of Nantes, however, drove him into the communion of the Catholic church to avoid persecution. He then became associate-chemist and pensionary in the Royal Academy of Sciences, and died in 1715. He wrote, 1. A Course of Chemistry; 2. An universal Pharmacopœia; 3. An universal Treatise of Drugs; and, 4. a Treatise on Antimony.

LEMGO, a city of the principality of Lippe-Detmold, in Germany, the capital of the bailiwick of Brake. It is situated on the river Vega, and is the largest place in the dominion, containing the palace of the sovereign, the courts

Lemma || Lemonnier.

of justice, the institutions for education, and 640 houses, with 3570 inhabitants. It was formerly one of the Hans Towns, but has now little trade, and only manufactures fine linen. Long. 8. 49. 13. E. Lat. 52. 1. 40. N.

LEMMA (from λαμβανω, *I assume*), in *Mathematics*, denotes a previous proposition, laid down in order to clear the way for some following demonstration, and prefixed either to theorems, in order to render their demonstration less perplexed and intricate, or to problems, to make their resolution shorter and more easy. Thus, to prove a pyramid one third of a prism or parallelopiped, of the same base and altitude, the demonstration of which in the ordinary way is difficult and troublesome; this lemma may be premised which is proved in the rules of progression, that the sum of the series of the squares, in numbers in arithmetical progression, beginning from 0, and going on, 1, 4, 9, 16, 25, 36, &c. is always subtriple of the sum of as many terms, each equal to the greatest; or is always one third of the greatest term multiplied by the number of terms. Thus, to find the inflection of a curve line, this lemma is first premised, that a tangent may be drawn to the given curve in a given point. So, in physics, to the demonstration of most propositions, certain lemmata are necessary to be allowed, as that there is no penetration of dimensions, that all matter is divisible, and the like.

LEMNIAN EARTH, *Terra Lemnia*, a medicinal, astringent sort of earth, of a fatty consistence and reddish colour. It derives its name from the island of Lemnos, whence it is chiefly brought. Many form it into round cakes, and impress a seal upon it; and hence it is also called *terra sigillata*.

LEMNIUS, LÆVINUS, a famous physician, born in Zealand in 1505. He practised physic with much applause; and, having taken holy orders, became canon of Ziric Zee, where he died in 1560. He left several works, the principal of which is entitled *De occultis Naturæ Miraculis*.

LEMNOS, an island in the Archipelago, in the Turkish province of Lesbos or Midilly. It extends over 165 square miles, from north latitude 39. 46. to 40. 2. and from east longitude 24. 52. to 25. 33. It is very narrow in the middle, where there are two harbours on the opposite sides of the tongue of land which joins the two parts. These are mountainous, and, though not lofty, were in ancient times said to have been volcanic; and the warm springs near the mountain Therma confirm the opinion. The soil is not highly fertile, but it produces wheat, barley, grapes, figs, almonds, and some oil. Water is not abundant, and there is a great scarcity of fuel. The inhabitants are about 8000, mostly Greeks, and inhabit two towns and fifty villages, some of whom find occupation in the fisheries. The capital is the town of the same name, the ancient Myrina. It is the seat of a Greek bishop, is without walls, but protected by a castle, and has a small haven, and about 1000 inhabitants, of whom 300 are Turks. There are some establishments for building vessels, which is the principal employment of the population.

LEMON ISLAND, one of the Skelig Islands, situated off the coast of the county of Kerry, in the province of Munster, in Ireland. It is a round rock, always above water, and therefore nowise dangerous to ships. An incredible number of gannets and other birds breed here; and it is remarkable that gannets nestle nowhere on the southern coasts of Ireland except on this rock, though many of them are seen on all parts of the coast upon the wing. There is another rock on the northern coast of Ireland, remarkable for the same peculiarity.

LEMONADE, a liquor prepared from water, sugar, and lemon or citron juice, and which is very cooling and grateful.

LEMONNIER, PETER (CLAUDE) CHARLES, a diligent and accurate astronomer, born at Paris, on the 23d of November 1715, was the son of Peter Lemonnier, of St Sever, in Normandy.

His father was a professor of philosophy in the College d'Harcourt, and member of the Academy of Sciences. He distinguished himself, as a teacher, by his activity in promoting the introduction of mathematical reasoning into the Cartesian philosophy. Under such auspices, the son might have enjoyed facilities for the cultivation of any of the sciences; but he soon showed a decided preference for astronomy, and began to be a practical observer before he was sixteen. In the month of November 1732, Mr Fouchy procured him the use of a mural quadrant of three feet radius, and he soon applied himself with diligence to the determination of the sun's greatest equation, an investigation which he continued for many years; and in 1741, he found the equation to amount to 1° 55′ 31″; a quantity differing only by 7″ from Delambre's latest determination.

He presented to the Academy of Sciences, in 1735, an elaborate map of the moon, accompanied by some remarks; and in the month of April of the following year, before he was twenty-one years old, he was made a member of the Academy, in the character of Adjunct Geometrician. He continued to be a constant contributor to its Memoirs for more than fifty years. The winter of 1736 and 1737 he passed at Torneo, with Clairaut and Maupertuis, as a member of a committee appointed by the Academy for measuring a degree in Lapland; and he was not less zealous than any of his colleagues in the execution of that arduous undertaking.

He is considered as having effected, in conjunction with Lacaille, a complete reformation in the practical astronomy of France. He entered very early into correspondence with the English astronomers of the day; they had carried their instruments and modes of observation to a higher degree of perfection than their neighbours; and Lemonnier was of great use to the science, in making known to his countrymen the practical methods of Flamsteed, and in introducing the instruments of Graham and Bird. In April 1739, he was made a foreign member of the Royal Society of London, and for the last twelve or fourteen years of his life he is said to have been the senior member of the society. He was the first that introduced the effects of nutation, then lately discovered by Bradley, into the solar tables; and he complained bitterly of Lacaille's injustice, in not giving him due credit for the improvement.

The Duc de Noailles made him known to the king of France, who was fond of his company, and showed him many kindnesses. In 1742, he gave him apartments at the Capucins in the Rue St Honoré, where he continued to live till the Revolution. On another occasion, when he had taken great pains to fix an accurate meridian at St Sulpice, the king made him a present of 15,000 livres, which he expended in the purchase of instruments, as the greatest luxury that he was capable of enjoying.

The places of the stars, which he determined in 1740, served Lalande for the purpose of computing their proper motions, though they differed a little from the results of Bradley's observations. About 1746, he was much engaged in examining the inequalities of Saturn, produced by the attraction of Jupiter; and Euler employed his computations in the theory which obtained a prize in 1748; each confirming the accuracy of the other. He continued to observe the moon, without intermission, for fifty years, though a small part only of his observations was published.

In the year 1748 he went to England, partly for the purpose of obtaining further information from a personal acquaintance with the astronomers and opticians resident in London, and partly in order to observe the solar eclipse of that year, in a situation where it would be very nearly annular. He proceeded accordingly to Scotland with the Earl of Morton, accompanied by Short the optician, and they observed the eclipse together at Aberdour, an ancient residence of Lord Morton's, in Fifeshire. They obtained their time from the College at Edinburgh, where there was a transit instrument, by means of the flash of a cannon fired from the castle at twelve, and another five minutes after. "The eclipse was so nearly annular, that, at the nearest approach, the cusps seemed to want about one-seventh of the moon's circumference to be joined; yet a brown light was plainly observed, both by Lord Morton and myself," says Mr Short, "to proceed or stretch along the circumference of the moon, from each of the cusps, about one third of the whole distance of the cusps from each cusp; and there remained about one third of the whole distance of the cusps not enlightened by this brown light, so that we were for some time in suspense whether or not we were to have the eclipse annular with us. During the greatest darkness, the planet Venus was seen at Edinburgh, and other places, by a great number of people, but I did not hear of any other stars being seen. The darkness was not great, but the sky appeared of a faint languid colour." In fact, our mornings and evenings are always illuminated by a light, which has acquired more or less of a red tinge in its oblique passage through the atmosphere; and when we have a similar light without the redness, the contrast between the sensation and the memory makes it appear "faint," that is, greenish or grey, instead of white. Mr Lemonnier was particularly anxious to measure the moon's diameter, which "he found $29' 47\frac{1}{2}''$," agreeing precisely with the computed diameter, and not requiring any correction for the supposed effects of irradiation. A similar remark was made by a very accurate practical astronomer in the eclipse of 1820.

In order to verify the position of his mural quadrant, which was of eight feet radius, and made by Bird, Lemonnier felt the advantage of having a moveable one to compare with it, and he procured a block of marble eight feet by six, and fifteen inches thick, turning on an axis, to which he fixed his smaller instrument, of five feet radius, in order to be able to reverse its position. He devoted a considerable portion of his time to the investigation of the laws of magnetism, and especially to the variation of the compass; and he endeavoured to ascertain the effect of the moon's influence on the winds, and on the atmosphere in general.

Lemonnier had long disputed the accuracy of the Parisian base, measured by Cassini and Maraldi, but he was at last convinced that his objections were groundless. He was originally a most zealous friend and patron of Lalande; but afterwards, having taken offence at some slight cause, he refused to see him for many years. In fact, he appears to have been somewhat obstinate and irritable; but he is said to have had genius, zeal, activity, and intelligence, as well as credit in the world, and reputation among men of science. He was a voluminous writer; he had much learning and sagacity, but he often wanted precision in his language and his reasoning. In November 1791, he had a paralytic attack, which terminated his scientific career, though he survived it till the 2d of April 1799, when a second stroke carried him off, at Héril, near Baïeux. He was made, in the mean time, one of the 144 original members of the National Institute, as a testimony to the merit of his past labours.

He had married, in 1763, Mlle. de Cussy, a lady of very respectable family in Normandy. He had three daughters; the first married Mr de Parfouru, who was an early victim of the Revolution; the second the celebrated Lagrange; and the third her uncle, Lemonnier the physician, who was also a man of considerable science, and a member of the Royal Society of London.

From 1735 to 1790, there are very few volumes of the Memoirs of the Academy without one or more of Lemonnier's papers; but though not unimportant in the aggregate, they are somewhat uninteresting in the detail. They relate almost exclusively to astronomical observations; eclipses, occultations, appulses, oppositions, and conjunctions; solstices, longitudes and latitudes; with some accounts of astronomical instruments and apparatus. There are also some memoirs relating to the sun's equation and diameter, and on his place, as compared with Arcturus; on the motion of Saturn, and on his fifth satellite; on the expansion of wooden measures; on the transit of Venus, and on the diameter and the tables of that planet; on Euler's formula for parallax; on the variation of the needle; on lunar altitudes; on the tides; on horizontal refraction; on Saturn's ring; and on some currents of wind. He also published separately some extensive works, which acquired considerable celebrity.

1. The first was his Histoire Célèste, 4to, 1741, comprehending the interval from 1666 to 1685, and containing an account of a transit instrument of Graham's construction.

2. Théorie des Comètes, 1743, in 8vo, including a translation of Halley's work on comets, together with a method of computing the orbit from three observations.

3. Institutions Astronomiques, 4to, 1746; an improved translation of Keill's Astronomy, which long continued to be the best elementary treatise in the French language. It contains also solar tables, and a variety of other additions derived from observation.

4. Observations Astronomiques, part i. 1751; ii. 1754; iii. 1759; iv. 1775.

5. A Letter on the Theory of the Winds, in Halley's Tables, published by Chappe.

6. Nouveau Zodiaque, reduit à 1755, Paris, 1755, in 8vo, containing thirty-one pages of charts, much more complete than those of Senex, and superseded by some very late publications only.

7. A History of Astronomy in the Traité d'Aberration of Fontaine des Crutes.

8. Observations pour la Mésure du degré entre Paris et Amiens, 8vo, 1757.

9. Abrégé du Pilotage, par Goubert, 1766, in 4to, with additions.

10. Astronomie Nautique Lunaire, 8vo, 1771.

11. Exposition des Moyens les plus faciles de résoudre plusieurs questions dans l'Art de la Navigation, 1772, in 8vo, employing very generally a table of verse sines, and greatly recommending the use of Gunter's scale for nautical computations.

12. Essai sur les Marées, 1774, in 8vo, particularly describing the effects of the tides at Mont St Michel, and on the neighbouring flat sands, and including also some considerations on refraction, and on magnetism.

13. Déscription et Usage des principaux Instrumens d'Astronomie, 1774, folio, forming part of the collection of Arts et Métiers.

14. Atlas célèste de Flamsteed, 1776, in 4to, revised.

15. Lois du Magnétisme, 2 parts, 8vo, 1776–8, with an elaborate chart.

16. Traité de la Construction de Vaisseaux, par Chapman, 1779, folio, from the Swedish, and said to be less perfect than the translation of Vial du Clairbois.

17. Mémoires concernant diverses questions d'Astronomie et de Physique, 4 parts, 1781–4–6–8, in 4to.

18. De la Correction introduite pour accourcir la Ligne sèche du Lock de dix-huit pieds, 8vo, 1790.

19. Lettre au sujet d'une Eclipse, Par. 1791; together with some remarks on navigation, and on the cur-

rents of the South Seas, all apparently from the Memoirs of the Academy. The eclipse, which was observed as annular in China, should have been total, according to the computed distance of the luminaries concerned.

LEMURES, in *Antiquity*, spirits or hobgoblins, restless ghosts of departed persons, who return to terrify and torment the living.

These are the same with *larvæ*, which, according to the ancients, wandered throughout the world frightening good people, and plaguing the bad. For this reason, *lemuria* or feasts were instituted at Rome to appease the manes of the defunct.

Apuleius explains the ancient notion of manes. The souls of men released from the bonds of the body, and freed from performing their corporeal functions, become a kind of demons or genii, who were formerly called *lemures.* Of these *lemures*, those that were kind to their families were called *lares familiares ;* but those who, for their crimes, were condemned to wander continually, without meeting with any place of rest, terrifying good men, and vexing the bad, were vulgarly called *larvæ.*

An ancient commentator on Horace mentions, that the Romans wrote *lemures* for *remures*, a word formed from Remus, who was killed by his brother Romulus, and who returned to the earth to torment him. But Apuleius observes, that, in the ancient Latin tongue, *lemures* signifies the soul of a man separated from the body by death.

LEMURIA, or Lemuralia, a feast solemnized at Rome on the 9th of May, to pacify the manes of the dead, or in honour of the *lemures.* It was instituted by Romulus to appease the ghost of his murdered brother Remus, which he thought was continually pursuing him to revenge the crime. Sacrifices continued for three nights, the temples were shut up, and marriages were prohibited during the solemnity. A variety of whimsical ceremonies were performed, and the ghosts were desired to withdraw, without endeavouring to hurt or affright their friends above ground. The chief formalities were ablution, putting black beans into their mouths, and beating kettles and pans, to make the goblins keep at a respectful distance.

LENA, a large river of Asiatic Russia, which rises in the ridge of mountains to the north-west of Lake Baikal, and which flows almost from south-west to north-east, till near Yakoutsk. In this part of its course its tributaries are the Wilime and the Olekma ; and, combined with the Obi and the Toungouska, it furnishes an almost continued navigation across Siberia. Soon after passing the Yakoutsk, it receives the Aldane, the largest of its tributaries, by which the navigation is continued nearly to Okhotsk. Turning north-west from this point, and slightly declining to the west, it rolls through vast and uninhabited plains. The Wilhoui is the only other considerable one of its tributaries. It has a broad and deep channel, and it forms numerous islands, both in its course and in the sea at its mouth. The length of its course may be estimated at 2000 miles.

LENÆA, a festival observed by the Greeks in honour of Bacchus, at which there was much feasting and jollity, accompanied with poetical contentions, and the exhibition of tragedies.

LENDINARA, a town of Italy, in the Austrian delegation of Polesina. It is situated on the river Adigetto, is the capital of the district, and contains thirteen churches, and 5190 inhabitants, employed in various trades and manufactures.

LENDING-Houses. That it should have once been conceived unlawful to exact interest for the loan of money, will not appear surprising, when it is considered, that at an early period the occupations by which a man could support his family were neither so numerous nor so productive as in modern times. As money, therefore, was at that time sought to remove immediate necessity, those who advanced it were influenced by benevolence and friendship. But on the extension of trade, arts, and manufactures, money lent produced much more than what was adequate to the borrower's daily support, and therefore the lender might reasonably expect from him some remuneration. To the lending of money upon interest, according to the earliest accounts, succeeded the practice of establishing funds for the relief of the needy, on condition that they could deposit any thing equal in value to double the sum borrowed, for which they were to pay no interest. But as, on the one hand, the idea of exacting interest for the loan of money was odious to the members of the Catholic church in general, and as, on the other, it appeared proper and even necessary to pay interest for money to be employed in commerce, the pontiffs themselves at length allowed the lending-houses to take a moderate interest ; and in order not to alarm the prejudices of those to whom the measure was obnoxious, it was concealed under the name of being paid *pro indemnitate*, the expression made use of in the papal bull.

It appears that lending-houses, which gave money on the receipt of pledges, at a certain interest, are by no means of recent date ; for many houses of this description, in Italy at least, were established in the fifteenth century, by Marcus Bononiensis, Michel a Carcano, Cherubinus Spoletanus, Antonius Vercellensis, Bernardinus Tomitano, and others.

The lending-house at Perugia, established by Barnabas Interamnensis, was inspected in 1485 by Bernardinus, who augmented its capital, and in the same year established one at Assisi, which was confirmed by Pope Innocent, and visited and improved by its founder in the year 1487. He likewise established one at Mantua, after formidable opposition, having procured for it the sanction of the pope. The same person also founded lending-houses at Florence, Parma, Chieti, and Piacenza, in doing which he was sometimes well received, whilst at others he frequently met with great opposition. A house of this kind was established at Padua in the year 1491, and another at Ravenna, which were approved of and confirmed by Pope Alexander VI.

Long after the period here referred to, lending-houses were established at Rome and Naples ; that of the former city having been opened in 1539, and that of the latter probably in the following year. A lending-house was established at Nuremberg in Germany about 1618, the inhabitants having obtained from Italy the regulations of different houses, in order to select the best. In France, England, and the Netherlands, lending-houses were first known under the denomination of *Lombards.* Similar institutions were formed at Brussels in 1619, at Antwerp in 1620, and at Ghent in 1622.

Although such houses must be allowed to be of very considerable utility under certain circumstances, especially when interest is not allowed to be exorbitant, yet they were always odious in France. One was however established at Paris in 1626, in the reign of Louis XIII. which the managers next year were obliged to abandon. The *mont de piété* at that city, which has sometimes had in its possession forty casks full of gold watches that were pledged, was established by royal authority in the year 1777, as we learn from the Tableau de Paris, published at Hamburg in 1781.

LENFANT, James, a learned French writer, was born in 1661. After studying at Saumur, he went to Heidelberg, where he received imposition of hands for the ministry in 1684. He discharged the functions of this character with great reputation there, as chaplain of the electress dowager palatine, and pastor in ordinary to the French church. But the descent of the French into the palatinate obliged him to depart from Heidelberg in 1687. He went to Berlin, where the elector Frederick, afterwards king of Prussia, appointed him one of the ministers. He continued there thirty-nine years, distinguishing himself by his writings. He was preacher to the queen of Prussia, Charlotte Sophia, and, after her death, to the king of Prussia. In 1707 he took a journey to England and Holland, where he had the honour to preach before Queen Anne, and might have settled in London, with the title of chaplain to her majesty. In 1712 he went to Helmstadt, in 1715 to Leipsig, and in 1725 to Breslau, to search for rare books and manuscripts. It is not certain whether it was he that first formed the design of the *Bibliothèque Germanique*, which began in 1720; or whether it was suggested to him by one of the society of learned men, which took the name of *Anonymous*, and who ordinarily met at his house. He died in 1728. His principal works are, 1. The History of the Council of Constance, in two vols. 4to; 2. A History of the Council of Pisa, in two vols. 4to; 3. The New Testament, translated from the Greek into the French, with Notes by Beausobre and Lenfant, in two vols. 4to; 4. The History of Pope Joan, from Spanheim's Latin Dissertation; 5. Several pieces in the *Bibliothèque Choisie*, *La République des Lettres*, *La Bibliothèque Germanique*, and other publications.

LENGLET, Nicholas du Fresnoy, born at Beauvais, in France, 1674, was a prolific and useful French writer on a variety of subjects, historical, geographical, political, and philosophical. His chief productions are, a Method of Studying History, with a Catalogue of the Principal Historians of every Age and Country, published in 1713, a work which established his reputation as an historical writer, and was translated into most of the modern languages; and a Copious Abridgment of Universal History and Biography, in chronological order, under the title of *Tablettes Chronologiques*, which made its first appearance at Paris in 1744, in two vols. 8vo, and was universally admired by the literati in all parts of Europe. The author attended, with great candour, to well-founded and judicious criticisms. In subsequent editions he made several alterations and improvements; and from one of these, that of 1759, an English translation was made, and published at London in 1762, in two vols. 8vo. Du Fresnoy died in 1755. The Paris edition of 1759 was printed from the author's corrected copy; and the impression being sold off, another edition appeared in 1763, with considerable improvements by an unknown editor. To the biographical part a great number of names of respectable persons are added, not to be found in the former edition; and it has this advantage in the historical parts, that the general history is brought down to the year 1762. Du Fresnoy, however, has loaded his work with catalogues of saints, martyrs, councils, synods, heresies, schisms, and other ecclesiastical matters, fit only for the libraries of convents and colleges.

LENGTH, the extent of any thing material from end to end. In duration, it is applied to any space of time, whether long or short.

LENGTHENING, in ship-building, the operation of cutting a ship down across the middle, and adding a certain portion to her length. It is performed by sawing her planks asunder in different places of her length, on each side of the midship frame, to prevent her from being too much weakened in one place. The two ends are then drawn apart to a limited distance, which must be equal to the proposed addition of length. An intermediate piece of timber is next added to the keel, upon which a sufficient number of timbers are erected to fill up the vacancy produced by the separation. The two parts of the kelson are afterwards united by an additional piece, which is scored down upon the floor timbers, and as many beams as may be necessary are fixed across the ship in the new interval. Finally, the planks of the side are prolonged so as to unite with each other, and those of the ceiling are refitted in the same manner, by which the whole process is completed.

LENHAM, a town in the hundred of Eyhorne, and lathe of Aylesford, in the county of Kent, forty-five miles from London and ten from Maidstone, situated at the source of the river Len. It had formerly a market, which has been long discontinued. The population amounted in 1801 to 1434, in 1811 to 1509, in 1821 to 1959, and in 1831 to 2197.

LENNEP, a city, the capital of a circle of the same name, in the Prussian government of Dusseldorf. It is the chief seat of the fine broad cloth manufacture, in which machinery has been much extended of late years. It contains 480 houses, and about 5000 inhabitants, who have much increased, from the state of the trade.

LENKEROON, a port of Ghilan, in Persia, on the Caspian. Its harbour, being much safer than that of Reshd, is more frequented by the merchants. It exports silk in considerable quantity. The Russians attempted to storm it, but were repulsed with great loss. It is 110 miles north-west of Reshd.

LENNOX, or Dumbartonshire, a county of Scotland. See Dumbartonshire.

LENS, a piece of glass, or any other transparent substance, the surfaces of which are so formed that the rays of light, by passing through it, are made to change their direction, either tending to meet in a point beyond the lens, or rendered parallel after converging or diverging, or, lastly, proceeding as if they had issued from a point before they fell upon the lens. Some lenses are convex, or thicker in the middle; some concave, or thinner in the middle; some plano-convex, or plano-concave, that is, with one side flat, and the other convex or concave; and some are called *meniscuses*, or convex on one side and concave on the other.

Lenses are of two kinds, either blown or ground. *Blown lenses* are only made use of in the single microscope, and the common method of making them has been to draw out a fine thread of the soft white glass called crystal, and to convert the end of it into a spherule by melting it at the flame of a candle. Mr Nicholson observes, that window-glass affords excellent spherules. A thin piece from the edge of a pane of glass one tenth of an inch thick was held perpendicularly, and the flame of a candle was directed against it by means of the blow-pipe, when it became soft, and the lower end descended by its own weight to the distance of about two feet, where it remained suspended by a thin thread of glass about $\frac{1}{500}$th of an inch in diameter. A part of this thread was applied endwise to the lower blue part of the flame of the candle without the blow-pipe, when the end became instantly white-hot, and formed a globule, which was gradually thrust towards the flame till it became sufficiently large. A number of these were made, and examined by viewing their focal images with a deep magnifier, when they appeared to be bright, perfect, and round. *Ground lenses* are such as are rubbed into the shape required, and polished.

LENT, a solemn time of fasting in the Christian church, observed as a time of humiliation before Easter, and the great festival of our Saviour's resurrection.

Those who belong to the Catholic church, and some of the Protestant communion, maintain that it was always a fast of forty days, and, as such, of apostolical institution. Others think that it was only of ecclesiastical institution, and that it was variously observed in different churches, and grew by degrees from a fast of forty hours to a fast of forty days. This is the opinion of Morton, Bishop Taylor, Dumoulin, Daillé, and others.

Anciently the manner of observing Lent amongst those who were piously disposed, was to abstain from food till evening. Their only refreshment was a supper; and then it was indifferent whether it was flesh or any other food, provided it was used with sobriety and moderation.

Lent was thought to be the proper time for exercising more abundantly every species of charity. Thus what they spared from their own use, by abridging themselves of a meal, was usually given to the poor; they employed their vacant hours in visiting the sick and those that were in prison, in entertaining strangers, and in reconciling differences. The imperial laws forbade all prosecution of men in criminal actions, that might bring them to corporeal punishment and torture, during the whole of this season. It was a time of more than ordinary strictness and devotion, and therefore in many of the great churches they had religious assemblies for prayer and preaching every day. All public games and stage-plays were prohibited at this season; also the celebration of all festivals, birth-days, and marriages, as unsuitable to the occasion.

The Christians of the Greek church observe four lents. The first commences on the 15th of November; the second is the same with our lent; the third begins the week after Whitsuntide, and continues till the festival of St Peter and St Paul; and the fourth commences on the first of August, and lasts no longer than till the 15th. These lents are observed with great strictness and austerity; but on Saturdays and Sundays they indulge themselves in drinking wine and using oil, which are prohibited on other days.

LENTINI, a parliamentary city of the island of Sicily, in the kingdom of Naples, and province of Noto, 120 miles from Palermo. It is situated on some broken ground above the Leontine fields. The situation is subject to malaria, and, though it contains 1400 houses, the inhabitants scarcely exceed 5000. The surrounding district is highly productive of rice, hemp, corn, oil, and liquorice.

LEO X. Pope, second son of Lorenzo de' Medicis, was born at Florence in December 1475, and received the baptismal name of Giovanni, or John. He received the tonsure at seven years of age, his father having destined him for the church. Being even at that early period declared capable of clerical preferment, he obtained two rich abbeys, through the interest of his father with Louis XI. of France, and Sixtus IV. At a very early period he held no fewer than twenty-nine church preferments, a strong proof of the most scandalous corruption, as well as of the interest which his family enjoyed. In the time of Innocent VIII. he was promoted to the rank of cardinal, when no more than thirteen years of age, which took place in the year 1488. If the great influence of his father was unquestionably censurable in promoting the rapid and illegal advancement of his son, it is but justice to admit, that he employed all his efforts to qualify him for such premature dignity. Angelo Poliziano had the care of his early education, which was greatly accelerated by the uncommon gravity and solidity of his disposition. He was invested with the purple in 1492, and went afterwards to reside at Rome as one of the sacred college. Having opposed the election of Alexander VI. to the pontificate, he found it prudent to withdraw to Florence, in which place he acquired much personal esteem; but on the invasion of Italy by Charles VIII. of France, he was involved in the expulsion of his brother Pietro, and took refuge at Bologna. In 1499 he made a tour through the states of Venice, Germany, and France, and afterwards went to Rome, where, in consequence of his prudent behaviour, he lived safe and respected during the pontificate of Alexander.

In 1505, when thirty years of age, he began to take an active part in public affairs, and Julius II. appointed him governor of Perugia. As he adhered with unshaken resolution to the interest of the pope, he acquired the confidence of his holiness in so eminent a degree, that he was intrusted with the direction of the papal army against France; and, if he was not competent to conduct the military operations, he was of singular service in maintaining good order in the camp. He was taken prisoner at the bloody battle of Ravenna in 1512, and conveyed to Milan, where the dignity of his sacred office procured him respect. From this place he found means to escape, returned to Bologna, and assumed the government of the district in the capacity of the pope's legate.

At the election of a new pope in the room of Julius II. he was chosen to the pontificate, being then only thirty-eight years of age. Whatever might be the leading motives of the conclave for electing so young a pope, it is agreed on all hands that it was not effected by those corrupt practices too common on such occasions; and he ascended the throne under the name of Leo X. with stronger proofs of affection on the part of both Italians and foreigners than the greater part of his predecessors. He displayed his love of literature by the nomination of Bembo and Sadoleti as papal secretaries.

One of his first attempts was to free Italy from the dominion of foreign powers; and having taken into pay a large body of Swiss, he gained a victory over the French in the reign of Louis XII. at the bloody battle of Novara, by which means they were driven from Italy; whilst the king of France having incurred ecclesiastical censure, submitted in form, and received absolution. Having thus secured internal tranquillity, he turned his attention to the encouragement of literature and men of genius. He effected the restoration of the Roman university to its former splendour by means of new grants and privileges, and by filling the professorships with distinguished characters from every quarter. A Greek press was established in the city, and all Europe was informed that persons bringing ancient manuscripts to the pope would be liberally rewarded, besides having them printed at the expense of the holy see. He also promoted the study of oriental literature, and he had the honour of founding the first professorship of the Syriac and Chaldaic languages at Bologna.

On the death of Louis XII. of France, and the accession of Francis I. to the throne, it soon became apparent that a new war was inevitable in the north of Italy. Leo endeavoured to remain neutral, but without success; in consequence of which he joined in a league with the emperor, the king of Aragon, the states of Milan and Florence, and the Swiss cantons, against the French king and the state of Venice. But he soon found it expedient to desert his allies, and form a union with Francis, which took place in 1515, at an interview between the two sovereigns.

In 1517, the Duke of Urbino, whom he had expelled in order to make way for his nephew Lorenzo, collected an army, and by rapid movements regained his capital and dominions, which chagrined Leo to such a degree that he endeavoured to excite all the Christian princes against him. He raised an army under the command of his nephew, and the duke was finally compelled to relinquish his dominions upon honourable terms. In this year the life of Leo was in danger, and all his moments were embittered by a conspiracy against him in his own court. Petrucci, the ringleader, had formed a plan of destroying the pope by poison; but having failed in this attempt, he withdrew from Rome, still, however, carrying on a correspondence with his secretary. Some of his letters being intercepted, he was arrested on his way to Rome, committed to prison, and strangled, whilst his accomplices were put to death with the most severe tortures. To shelter himself from danger, whether real or imaginary, Leo created thirty-one new cardinals in one day, chiefly from amongst his own relations, though some of them were deserving of the dignity by their virtues and talents.

In the reign of this pontiff began the reformation of religion under the celebrated Martin Luther, who inflict-

Leon.

ed a wound on the Catholic church which will never probably be healed. Leo's taste for magnificence and expense having exhausted his coffers, he took from the church the profits arising from the sale of indulgences, for his own private emolument. These wares were extolled in language which shocked the pious and thinking part of mankind, and facilitated the progress of the reformation in the hands of such a man as Luther. The latter, during his opposition to the extravagance of Leo in the sale of indulgences, was still willing to be reconciled to the church; but as he insisted on making an unqualified appeal to the language of Scripture, and Leo would admit of nothing but an unqualified appeal to the decrees of the church, a reconciliation was found impossible. The works of Luther were burned in different places by Leo's command, and Luther in his turn made a solemn and public conflagration of the papal decrees and constitutions, and even of the bull itself. It was this pontiff who conferred on Henry VIII. of England the title of defender of the faith.

The private hours of Leo, it is said, were devoted to indolence, or to amusements, some of which were unworthy of his clerical dignity. He never lost sight of his favourite idea of expelling the French from Italy. The Swiss in the service of France having been induced to desert, the allies crossed the Adda, and occupied Milan without opposition. They next entered the territories of the Duke of Ferrara, who had espoused the cause of France. Many of his strong places were taken, and siege was about to be laid to his capital, when it was prevented by the indisposition of the pope, which in the space of eight days terminated in his death, on the 1st of December 1521, in the forty-sixth year of his age and the ninth of his pontificate.

LEOMINSTER, a borough and market-town of the hundred of Wolphy, in Herefordshire, situated on the river Wye, 137 miles from London. It has a corporation, consisting of a high steward, bailiff, recorder, and twelve burgesses, and still sends, as before, two members to parliament. The church is a neat and spacious building, adorned with an altar-piece by the celebrated Rubens. The tower of it has a musical peal of eight bells. There was formerly some woollen manufactures, which have disappeared. The chief trade now is in wool and flax, the latter of which grows of excellent quality. The market was formerly held on Thursday, but has been exchanged for Friday by act of parliament. The magistrates of Leominster have an exempt jurisdiction. The population of the borough amounted in 1801 to 3019, in 1811 to 3238, in 1821 to 3651, and in 1831 to 4300; but the whole parish at the last census contained 5249 inhabitants.

LEOBSHUTZ, a city, the capital of a circle of the same name, in Prussian Silesia, situated at the foot of the mountains. It is surrounded with walls, and contains five Catholic churches, an hospital, 530 houses, and 3670 inhabitants employed in making woollens, hosiery, and linen goods.

LEOBEN, a city of Austria, in the circle of Bruch, in the province of Steyermark. It stands on the river Mur, and is the see of a bishop; contains 278 houses, and 2200 inhabitants, who are employed in making iron. It is remarkable for the peace concluded at it in 1798, between Austria and France. Long. 15. 0. 25. E. Lat. 47. 23. 36. N.

LEON, a province, or, as it is more commonly called by the natives, a kingdom, of Spain. Asturias bounds it on the north side, Galicia on the west, Estremadura and Old Castile on the south, and New Castile on the east. Its extent is 1207 square leagues, and the number of its inhabitants is 714,037. It is frequently divided into six departments, those of Leon, Palencia, Valladolid, Tora, and Zamora; but the more recent division into two departments, each clearly defined by the course of the river Duero, is more natural, and less likely to perplex. The two divisions are denominated that of Leon to the north, and that of Salamanca to the south, of the Duero. Of the various rivers that cross Leon, the most considerable is the Pisuerga, in the northern limits, to the eastward of the fountains of the Ebro and Reynosa. This is one of the points of separation which divide those streams that run to the Atlantic, from those which run to the Mediterranean, and is consequently one of the most elevated districts in Spain. From its great elevation, it is necessarily cold; and some of its summits reach the line of perpetual snow. These hills produce the loftiest and best oaks in the peninsula, and are highly useful in the construction of ships. Many bears and some wolves are found in this range of mountains. The principal part of the labour of the mountaineers is directed to the iron mines, and to the manufactory of hardware. In the intervals between the highest hills they have good pastures, and feed many cows, from whose milk butter is made, which, if the natives understood, or rather practised, the simple art of salting, and packing in casks, might become a valuable branch of commerce with the other parts of Spain, which draw their supplies of that commodity from Holland or from Ireland. The mountains which diverge from these towards the west are very steep, and gradually increase in height till they reach the border of Asturias, with which the communication is held by fissures in the mountains called the Puertos de Piedrafita, de Pajares, de Somceda, &c.

The height of these mountains has never been accurately ascertained; but if the various plants that grow on their tops is a certain criterion of their elevation, they are equal to the Pyrenees, and to most of the points of the Alps. The inhabitants of these mountains are a detached race, and are thus described by Don Mariano Lagasca, a recent and very intelligent traveller. "The villages have few inhabitants, and are mostly in the valleys. The inhabitants are robust and simple in their manners; they are equally ignorant of luxury and drunkenness; all are clothed very coarsely, but warmly, from the looms of their own females, and have their garments made in the simplest fashion. Without physician, surgeon, or apothecary; without irregular pleasures, they live happily, drinking the milk of their cows, and eating their barley-bread and salted meat. They have no other bed than a table fixed to the wall at one end of their dwellings, which in shape resembles a coffin. They cultivate a few vegetables, and grow barley in some of the least cold parts of the district, but not sufficient for even their scanty consumption. From June to September they have abundant pasture for their own cattle, as well as for the migratory flocks of merino sheep that pass through their confines. In the valleys they have meadows, on which they make hay for winter food for their cattle. The only industry that is exercised is in making wooden shoes, and bowls and platters of the same substance, which they sell in the neighbouring lower districts. Some are also employed in collecting medicinal plants, which are sold to the city of Leon. Before the year 1803, it was not known that the district abounded in the Iceland moss. Since that period considerable quantities of that substance have been collected, and it is now sold in Madrid at twenty reals the pound, whereas before it was sold at 160. It has begun to form a branch of commerce with the mountaineers, and in time it may become an important article of subsistence for them, as it is for the natives of Iceland."

The river Pisuerga, descending to the plains, receives on the right the river Carrion, and on the left the Arlanza, and passes by Palencia, and through the fertile valley of Tierra de Campos, abounding in wine and oil, till it is joined by the Esgueva near the city of Valladolid, whence it has a short course to the Duero. The other rivers of Leon are the Esla, the Torio, the Bernesga, the Sil, and the Boeza, all of which unite ultimately with the

Duero. On the southern part of Leon, the department of Salamanca, the population is thicker, and the country more fertile. There are some mines of copper, and quarries of marble. Many cows, sheep, horses, and mules, are bred; and, though not a rich, yet, when compared with the mountain districts, it is a fertile tract of land. The principal rivers that water it are the Daraton, the Eresma, the Adaja, the Tormes, and the Agueda, which run to the Duero, and the Alogon, which runs south, and, after crossing part of Estremadura, loses its name in the Tagus.

The different agricultural and commercial productions of the kingdom of Leon will be found under the places in which they are created; and the history of Leon, long a separate kingdom, is included in the general history of Spain. The province of Leon, one of the five in the kingdom, according to the ancient mode of dividing it, is 493 square leagues in extent, and is inhabited by 239,810 people. It contains two cities, 197 towns, and 1284 villages, in 1373 parishes; and has fifty monasteries, and sixteen charitable institutions.

Leon, a city of Spain, in the province of the same name, and capital of it, as it was of the ancient kingdom of Leon before its union with Castile. It is situated on a kind of peninsula, formed by two rivers, the Torio and the Bernesga. It contains a population of about 7000 souls, who are employed principally in spinning thread, and making it into coarse linen. The country around it yields wheat, barley, and particularly flax; and they have meadows where the cattle are pastured, and, what is not usual in Spain, where they make hay. It is the see of a bishop, and, among various public buildings that attract attention, the most remarkable is his cathedral, a most beautiful specimen of the Gothic style of architecture. It contains thirteen parish churches, nine monasteries, four hospitals, 1500 houses, and 6170 inhabitants. Lat. 42. 45. N. The inhabitants make worsted stockings and caps, in forty looms; leather and leathern gloves; and have some tanneries.

Leon, *Peter Cicca de*, author of the history of Peru. He left Spain, his native country, at thirteen years of age, in order to go into America, where he resided seventeen years, and observed so many remarkable things, that he resolved to commit them to writing. The first part of his history was printed at Seville in 1553. He began it 1541, and ended it in 1550. He was at Lima, the capital of the kingdom of Peru, when he gave the finishing stroke to it, and was then thirty-two years of age.

LEONARD, St, a city of France, in the department of the Upper Vienne, and arrondissement of Limoges. It is situated on the Vienne; was formerly surrounded with walls, now converted into pleasing promenades, planted with trees. It contains 410 houses, and 4950 inhabitants, who carry on manufactories of flannels and druggets, make much leather, and some copper ware. Long. 1. 25. E. Lat. 45. 50. N.

LEONARDO da Vinci. See Vinci.

LEONESSA, a city of the kingdom of Naples, in the province Abruzzo Ulteriore. It stands on the river Corno, at the foot of the mountain Triglia. It contains 4719 inhabitants, who have some trade in corn, from living in a frontier town.

LEONIDAS I. king of Sparta, a renowned warrior, slain in defending the straits of Thermopylæ against Xerxes, 480 b. c.

LEONINE, in poetry, is applied to a kind of verses which rhyme at every hemistic, the middle always chiming to the end. The origin of the word is somewhat obscure. Pasquier derives it from one Leoninus or Leonius, who excelled in this species of composition, and dedicated several pieces to Pope Alexander III.; others derive it from Pope Leo, and others from the *lion*, by reason it is the loftiest of all verses.

LEONTICA, feasts or sacrifices celebrated amongst the ancients in honour of the sun. They were called *Leontica*, and the priests who officiated at them *Leones*, because they represented the sun under the figure of a lion radiant, bearing a tiara, and griping in his two fore paws the horns of a bull, which struggled with him in vain to disengage himself. The critics are extremely divided about this feast. Some will conceive it to have been anniversary, and make its return, not in a solar, but in a lunar year; others hold its return more frequent, and give instances where the period was not above two hundred and twenty days. The ceremony was sometimes also called *Mithriaca*, Mithras being the name of the sun amongst the ancient Persians. There was always a man sacrificed at these feasts till the time of Hadrian, who prohibited it by a law. Commodus introduced the custom anew, but after his time it was again exploded.

LEOPARD. See Mammalia.

LEPANTO, a town of Turkey in Europe, the capital of the province Ainabachti. It is situated in a bay celebrated for a victory over the Turkish fleet, by Don Juan, in 1751. It is defended by two forts, and contains a population of 2000 persons, chiefly Greeks, who carry on several tanneries, and other trades. Long. 21. 57. E. Lat. 38. 30. N.

LEPER'S Island, one of the New Hebrides, in the South Pacific Ocean, so called by Monsieur Bougainville, by whom it was visited in 1768. Long. 168. 4. E. Lat. 15. 21. N.

LEPIDOPTERA, in *Zoology*, an order of insects with four wings, which are covered with imbricated scales.

LEPROSY, a cutaneous disease, appearing in dry, white, thin scabs, either on the whole body, or only on parts of it, and usually attended with a violent itching and other pains. The leprosy is of various kinds, but the Jews were particularly subject to that called *Elephantiasis*. Hence the Jewish law excluded lepers from communion with mankind, banishing them into the country or uninhabited places, without excepting even kings. When a leper was cleansed, he came to the city gate, and was there examined by the priests. After this he took two live birds to the temple, and fastened one of them to a wisp of cedar and hysop tied together with a scarlet ribbon; the second bird was killed by the leper, and the blood of it received into a vessel of water; with this water the priest sprinkled the leper, dipping the wisp and the live bird into it. The live bird was then let go; and the leper having undergone this ceremony, was again admitted into society, and to the use of things sacred. (See Levit. xiii. 46, 47; and Levit. xiv. 1, 2, *et seq.*)

LEPTUM, in *Antiquity*, a small piece of money, which, according to some, was only the eighth part of an obolus; but others think it was a silver or brass drachm.

LEPUS, the hare, in *Astronomy*, a constellation of the southern hemisphere, the stars of which in Ptolemy's catalogue are twelve, in that of Tycho's thirteen, and in the Britannic nineteen.

LERIDA, a city of Spain, in the province of Catalonia. It is strongly fortified, and in a situation favourable for defence. It was the brilliant theatre of one of the campaigns of Julius Cæsar, and continued to be a place of military importance down to the war of the succession, when it supported the Austrian family; but, after the battle of Almanza, it submitted to the Bourbons. It is situated near the junction of the river Cinca with the Ebro, in a rich and well-cultivated plain. It is the see of a bishop, has a university, and a strong citadel; four parish churches, sixteen monasteries, one hospital, and 16,818 inhabitants.

LERWICK, the principal, and, indeed, with the exception of Scalloway, a village containing a few scattered cottages, the only town in the Zetland Islands. It is situated

Lesghistan || Lesley, John.

on the east side of Mainland, the largest island of the group, in latitude 60. north, and longitude 1. west. It consists of one irregular, ill-paved street, with several lanes branching off. The town is of comparatively modern date. Captain Smith, who visited the islands in 1633, describes the harbour, but makes no allusion to any town, which he would have done had it then existed. In 1700, Brand speaks of it as containing between two and three hundred families. A century afterwards, it is described as having a population of about 1000. By the census of 1821 the inhabitants amounted to 2224, and by that of 1831 to 2750. The only public buildings are, the town-house, which unites under one roof the court-room, the prison, the custom-house, and masonic lodge; the parish church; and a dissenting meeting-house. To the south of the town stands Fort-Charlotte, a citadel, first erected during the protectorate, and rebuilt by the second Charles in 1665; but having been burned in 1673 by the Dutch, it lay in ruins till 1781, when it was re-modelled, mounted with twelve guns, and named after the queen of George III. The harbour of Lerwick, called Bressa Sound, is large and most secure, the depth of water varying from five to sixteen fathoms. Two thousand *busses* from Holland, it is asserted, have found accommodation in it during the fishing season; and Sir Robert Sibbald says that, in 1653, the English fleet, consisting of ninety-four men of war, lay some days in the harbour, and that in 1665, another fleet, to the number of ninety-two sail, were there for some time. The only manufactory in Lerwick is one of straw-plait; still there is a considerable trade carried on with Leith and other towns. The exports are chiefly fish, butter, hides, tallow, calf and rabbit skins, stockings, and, till lately, kelp; the imports are, coals, cloths, groceries, and grain, Zetland not producing a sufficient quantity of the last for the consumption of the inhabitants. Few strangers have visited Lerwick without being delighted with the kindness and hospitality of the inhabitants; and all agree in praising the morals and intelligence of the common people. From the statistical returns made to the General Assembly in 1833, by the committee for increasing the means of education and religious instruction in Scotland, it appears that in the parish of Lerwick, containing a population of 3194 (viz. 2750 in the town, and 444 in the landward part of the parish), there are six schools, the parochial, and five on the teachers' own adventure; 201 scholars, of whom sixty-five attend the parochial, and 136 the other schools; and that, of the whole number of scholars, sixty-one are learning Latin, and twenty-five mathematics. The same document states, that all the inhabitants above six years of age are able to read; but this statement must be received with some grains of allowance.

LESBOS, a large island in the Ægean Sea, on the coast of Ætolia, about 168 miles in circumference. It has been successively called *Pelasgia*, from the Pelasgi, by whom it was first peopled; *Macaria*, from Macareus, who settled in it; and *Lesbos*, from the son-in-law and successor of Macareus, who bore the same name. The chief towns of Lesbos were Methymna and Mitylene. It was originally governed by kings, but they were afterwards subjected to the neighbouring powers. The wine which it produced was greatly esteemed by the ancients, and is still held in the same repute amongst the moderns. The Lesbians were so debauched and dissipated, that the epithet of *Lesbian* was often employed to signify debauchery and extravagance. Lesbos has given birth to many illustrious persons, such as Arion, Terpander, Sappho, and others.

LESCAILLE, James, a Dutch poet and printer, was born at Geneva. He and his daughter Catherine Lescaille excelled most of the Dutch poets. But the latter, who was surnamed the Sappho of Holland, and the tenth muse, died in 1711. A collection of her poems has been printed, in which are the tragedies of Genseric Wenceslaus, Herod and Mariamne, Hercules and Dejaneira, Nicomedes, Ariadne, Cassandra, and others. James Lescaille, her father, deserved the poet's crown, with which the Emperor Leopold honoured him in the year 1603. He died about the year 1677, aged sixty-seven.

LESGHISTAN, a territory of the Caucasus, bounded on the north by Circassia, and on the east by Daghestan. It is a stupendous range of mountains running in a south-easterly direction, of great length, but of inconsiderable breadth, and forming the whole north-eastern frontier of Georgia. Dr Reineggs describes this mountainous tract as broken by innumerable and frightful gulfs. These, he says, are united by strong stone or wooden bridges, by roads carried over impracticable rocks; streams are confined to a particular course, and wholesome spring-water is carried everywhere by pipes and canals cut out of the rock. The soil being scanty, and the level ground insufficient to enable the proprietor to raise the means of subsistence, he ingeniously contrives to increase the surface to the very summit of the heights, by graduated terraces, filling the intermediate spaces with rubbish, and covering them with earth. The houses of the inhabitants, seen from a distance, have an awful appearance, being situated on the loftiest summits of the mountain, and on the most frightful precipices. The Lesghaes are the bravest, as they are the most turbulent, of all the nations of the Caucasus, being the terror and scourge of all the neighbouring tribes, whose villages they lay waste, and whose inhabitants they carry into servitude. They are partly Mahommedans and partly idolators, the few tribes who yet remain in ignorance never changing the object of their veneration, which is either the sun, moon, or stars, or any other grand object that has made an impression on their minds. They have from time immemorial maintained their independence, partly by their own valour, and partly owing to the inaccessible nature of their country. They are accustomed to hire themselves out to fight the battles of their neighbours; their pay is twelve roubles the campaign, which must not last above three months. In these wars they often take opposite sides, to which they remain faithful, so that it frequently happens that a Lesghae falls by the hand of his brother or intimate friend. They are lightly dressed, according to the custom of the Tartars; and are armed with a gun, pistols, dagger, and sabre. Their women are distinguished for their beauty, surpassing even the females of Mount Caucasus; and they bring the largest prices in the markets of Constantinople.

LESKARD, a market and borough town of Cornwall, in the hundred of West, 237 miles from London. It was incorporated by Queen Elizabeth, and is governed by a mayor, recorder, and twelve capital burgesses. Upon the hills to the north are many tin mines at work, and the country surrounding feeds many sheep, so that the chief trade consists of tin and wool. The population of the town amounted in 1801 to 1860, in 1811 to 1975, in 1821 to 2423, and in 1831 to 2853; but the whole parish at the last census contained 4042 inhabitants.

LESLEY, John, bishop of Ross, was born on the 29th of September 1527. In an account of his life for which he must himself have supplied the materials, he is said to have been born of honourable parents, and to have been a descendant of the ancient and noble family of Lesley, which then continued to flourish in Scotland. According to another account, which is less vague in its terms, but still disguises the truth, his father was Gavin, a great-grandson of Andrew Lesley of Balquhain,[1] the represen-

---

[1] Laurus Leslæana explicata, § 31. Græcii, 1692, fol. "Gavanus, Alexandri quartogenitus, ducta in consortem thori N. N.

Lesley, John.

tative of a well-known family in the county of Aberdeen. Knox has clearly stated that he was the son of a priest;[1] and the illegitimacy of his birth is sufficiently ascertained from a dispensation, granted under the authority of a papal bull, and rendering him capable of receiving holy orders;[2] for without such a dispensation, a person of spurious birth was declared incapable by the canon law. In this document, bearing date the 9th of July 1538, he is described as a scholar of the diocese of Moray; and Keith conjectures, with great probability, that he was the son of Gavin Lesley, rector of Kingusie, and likewise, as he supposes, official of that diocese. The bishop's father is described as an eminent lawyer; and a knowledge of the canon law was indispensable in a person who held this judicial situation.

Lesley prosecuted his studies in King's College, Aberdeen, where he took the degree of A. M. Keith mentions a deed by the bishop of Aberdeen, promoting him, a "clerk of his diocese, to the character of an acolyte in his cathedral church, dated 15th June 1546." This statement is scarcely intelligible: the character of an acolyte, which cannot well be described as promotion, is that of an individual who has been admitted to one of the lower orders in the Romish church; the seven orders being those of porter, lector, exorcist, acolyte, subdeacon, deacon, and priest. In the twentieth year of his age, he became a canon of the cathedral churches of Aberdeen and Elgin. It was apparently this improvement in his circumstances that enabled him to obtain the most liberal education which was then to be procured. Having spent some time in Paris, where he directed his attention to the study of divinity and languages, especially the Greek and Hebrew, he proceeded to the university of Poitiers, and there applied himself to the study of the civil and canon laws for the space of nearly four years. He afterwards resided about a year at Toulouse, where he took the degree of licentiate of the civil law; and having returned to Paris, and taken the degree of LL. D. he continued for nearly another year to read lectures on the canon law. With these proofs of his academical attainments, he returned to his native country in the month of April 1554, and successively obtained many different preferments, secular as well as ecclesiastical. He was appointed professor of the canon law in the university of Aberdeen;[3] and on the 18th of April 1558, Bishop Gordon, with the dean and chapter, granted a commission, nominating him official of that diocese. The commission describes him as parson of Oyne and Morthlack, prebendary and canon of the cathedral church of Aberdeen; but a subsequent document, dated on the 2d of July 1559, relates to his induction and investiture in the parsonage, canonry, and prebend of Oyne, stall in the choir, and place in the chapter. "I did accept the office judicator of the dioces of Aberdene," he remarks, "where in I travelled ten yeres, and how I did behave my selfe therein, I report my selfe to the testimonie of the country; for besids the ministratioun of justice in mine owne office, I assisted the sheriffe of the shire with my counsell for execution of justice according to the lawes, and imployed alsoe other whyles great travells in compoundinge and agreeinge of differences betwixt parties, proceedinge either of deadly feads, or other debates for lands or goods, which is the right office of a judge, as saith the jurisconsult."[4]

The protestant religion had now obtained a stable footing in Scotland; and the Book of Discipline was presented to a convention of estates held at Edinburgh in the month of January 1561. Several of the papists had been summoned to give an account of their faith; and among these was the official of Aberdeen, together with Patrick Myrtom, treasurer, James Strahan, a canon of the cathedral, and Alexander Anderson, sub-principal of King's College. The disputants on the other side were Knox, Willock, and Goodman, whom we may easily suppose to have been an over-match for the theologians of Aberdeen. Of this disputation Lesley and Knox have each given an account, nor is it easy to reconcile their statements with each other. According to one of them, the four respondents made a very firm profession of the catholic faith; and of the sacrifice of the mass Anderson gave so able an exposition, that the heretics evinced no further inclination to dispute, either with him or any other catholic, concerning the high mysteries of the true religion. According to the other account, the sub-principal made a very lame defence of his opinions, and finally declined to continue the disputation, admitting "that he was better sein in philosophy then theology." Lesley was then required to answer the former arguments against the mass; "and he with gravity began to answer, If our master have nothing to say to it, I have nothing; for I knaw nothing bot the canone law; and the grittest ressoun that ever I culd find thare is *Nolumus & Volumus*." The historian of the reformation subjoins, "the nobility hearing that neyther the ane nor the uther wald answer directly, said, We have bene miserably deceaved heirtofor; for if the mess may not obtean remissioun of sines to the quick and the dead, quharefore war all the abbacies so richly dotit with our temporall lands?"[5] The other historian has stated that he and his associates were subjected to the punishment of being compelled to remain in Edinburgh, and listen to the sermons of the ministers.[6] From this statement, which is by no means incredible, there is a material departure in the biography to which we have already referred. "Upon this, the sectarian nobility were, by the instigation of the heretical ministers, so much incensed against Dr Lesley, and the doctors his associates, that they were taken into custody, and put in the prison of Edinburgh, the chief city of Scotland, where, after confinement for some time, they found sureties, who were bound in a very great penalty, that they should make their appearance, in order to their trial, whenever they should be required: upon which they were at length set at liberty, and returned to Aberdeen." This biographical tract was obviously intended to exalt the subject of it to the character of a great confessor and sufferer for the catholic faith; and some of its statements are apparently to be received with a certain degree of caution, if not suspicion.

On the death of Francis the Second, the leaders of the protestant party sent the prior of St Andrews to France, with the view of preparing the mind of the young queen for a favourable consideration of their cause. In order to

---

suscepit ex ea Joannem episcopum Rossensem." There is evidently a studied ambiguity in the expression. Mr Riddell mentions that the parson of Oyne was summoned as one of the nearest of kin to "Andrew Lesslie, son to the deceased William Lesslie of New-Lesslie, a pupil." (Remarks upon Scotch Peerage Law, p. 205. Edinb. 1833, 8vo.)

counteract this influence, Lesley was despatched on a similar mission by the popish earls of Huntley, Crawford, Athole, Sutherland, and Caithness, the archbishop of St Andrews, the bishops of Aberdeen, Moray, and Ross. He found Mary at Vitri in Champagne on the 15th of April 1561, and earnestly recommended to her care and protection the interests of the tottering church: he appears at the same time to have recommended himself very effectually to her good graces. She did not however adopt his desperate scheme of landing at Aberdeen, and endeavouring to raise an army for the purpose of restoring the catholic faith. He attended the queen on her return to Scotland, where she landed on the 21st of August. On the 14th of January 1564 he was admitted an ordinary judge of the court of session. If we may rely on the authority of the tract already quoted, he became president of that court, but this statement is not supported by the records: in the absence of the president, he may occasionally have filled his chair, and this is perhaps the only charitable construction which such an averment will easily admit. The queen likewise nominated him a member of the privy council, and bestowed upon him the abbacy of Lindores, which he was allowed to hold *in commendam*. The bishopric of Ross becoming vacant by the death of Henry Sinclair on the 2d of January 1565, she secured to him this higher preferment, and the necessary bulls were procured from the pope.

In the year 1566 the queen issued, under the great seal, a commission to certain noblemen, prelates, and lawyers, granting to them, or any six of their number, full power and authority to revise and publish the laws of the realm. They were to commence with the books called *Regiam Majestatem* and *Quoniam Attachiamenta*, and were to descend according to the order of chronology; but the only apparent fruit of their labours was a publication of the acts of parliament, from the reign of James the First. These were printed under the superintendence of the learned civilian, Dr Henryson, one of the commissioners; and in his preface he has particularly commended "ane Reuerend Father in God, Johne Bischop of Ros, Lord of our Soueranis Secreit Counsall, and of hir College of Justice, for his suggestioun to our Souerane of this notabill purpose, eirnistfull performing of the said commissioun, and cure in conuening of my Lordis Commissaris his colligis, and liberalitie in the furthsetting of this imprenting."[1]

To the fortunes of the queen Lesley adhered with unshaken fidelity; and as her career was marked by many actions which set virtue and decency at defiance, his employment as a privy counsellor could not always be very suitable to his character as a churchman. He is supposed to have been the individual who suggested an expedient for granting to the earl of Bothwell an indirect pardon for the murder of the king;[2] a crime to which there is the strongest moral evidence that the queen was an accessory, before as well as after the fact. On the 24th of April 1567 the earl seized her person, and conducted her as a prisoner to the castle of Dunbar. This act of apparent violence, which at first seemed to be so unnecessary, had evidently been devised with her entire approbation. The ultimate object of such an expedient did not long remain doubtful: in the course of a few days, she granted him a pardon for this treasonable act, and for all other crimes with which he could be charged. By a general clause, inserted in the common form, she pardoned the murder of her own husband, and yet avoided the scandal of mentioning it in direct terms. She soon afterwards created her paramour duke of Orkney; and having hastily procured a divorce from his wife, his infamous nuptials with the queen were celebrated on the 15th of May, about three months after he had assassinated her former husband. The measure of her guilt and folly was now full. She was committed to custody in the castle of Lochleven on the 15th of June, and was finally divested of the royal authority. On the 2d of May 1568 she escaped from her prison, and soon afterwards found herself at the head of a considerable army. The bishop of Ross had retired to his diocese, and, according to his own account, was there employing his time in contemplation and study, and in giving counsel to friends and others committed to his charge, when the queen sent him a message requiring his immediate attendance at Hamilton. In company with certain noblemen, whose names he does not mention, he accordingly hastened to obey this summons; but before his arrival her forces had been completely dispersed at the battle of Langside, and she had found it necessary to consult her safety by proceeding towards the borders of the two kingdoms. In an evil hour, she entered the English territory; for she speedily discovered that she had reposed her confidence in a cruel and unrelenting rival, whom neither the common ties of blood, nor the sympathy due from one sovereign princess to another who had fallen from her high estate, had any tendency to move with feelings of generosity or even of compassion.

Τὰς φρένας διέφθορε

Mary again required the services of the bishop, and in the month of September he waited upon her at Bolton castle. Lesley acted as one of her commissioners during the conferences which opened at York on the 4th of October, and in the course of the ensuing month were continued at Westminster. After many debates, which were very ably maintained on both sides, this commission terminated without any immediate result. In February 1569 he proceeded to Tutbury castle, where the queen was detained under the custody of the earl of Shrewsbury; but on some suspicion of having concerted a plan to effect her escape, both he and Lord Boyd were soon afterwards retained in ward at Burton upon Trent, and were not released till after an interval of nearly three months. The bishop was now employed in the capacity of an ambassador to the queen of England, and he acquitted himself with great zeal and ability, but not with corresponding success. He was instructed "to sue earnestly that the queen his mistres might be put to libertie, and restored to her crowne and realme; and to that effect to make such reasonable offers to the queen of England, as might fully satisfie her for anie speciall debate or contraversie that had hapned betwixt their majesties, touchinge the title of the crowne of England, and to assure that shee would alsoe shew her clemencie toward her subiects in Scotland whoe had offended her." His instructions embraced other particulars; and he was specially enjoined to acquaint the French and Spanish ambassadors with his proceedings, and to ask their advice in all matters connected with his mission. In the mean time, his pecuniary resources were somewhat scanty and precarious. A messenger brought me advertisement, he informs us, that the earl of Moray "had taken my house of Rosse from my servants, and medled with my whole benefices, and all that I had in Scotland, and had sayd to my freinds that he would cause me to leave my ambassade for povertie; which he intended should take effect, for he putt Androwe Monrowe his servaunt in my house at Rosse, whoe had spoiled it before, and slaine some of my servaunts in it, since my cominge into England, albeit it was recovered shortely by my friends in my absence from him at that time: but nowe he hath withholden the same, and taken up my whole fruicts continually since that time. And farther the erle would not suffer anie of my friends or merchants to make me anie furnyshinge; and he did well forsee that the queen my mistres might not support her owne necessitie, nor yet my chargs, at that time a great strayte; for he toke up her whole rents in Scotland, and the prince of Condies armie was lieinge then at Poicters and Toures, where the moste parte of her dowrie in Fraunce consists, and by that meanes shee could gett none of it, soe that truely wee were driven to a great strayte." In the midst of these perplexities, he applied to the French ambassador, who was unable to afford him any relief. Mary then wrote to the duke of Alva; and, on his responsibility, the Spanish ambassador furnished him with a thousand crowns, one portion of which he remitted to the queen, another to the garrison of Dunbarton castle, and the residue he retained for the expenses of the embassy; nor did he obtain any further supply during his residence at the court of England.

The scheme of a marriage between Mary and the duke of Norfolk involved many of their adherents in danger and difficulties. The duke was himself committed to the Tower, and several other men of rank were detained in custody. Lesley was repeatedly examined before the English queen and council, and was confronted with the earl of Leicester, who had likewise been implicated in the same transaction. The earls of Northumberland and Westmoreland had recourse to arms, but were not long able to keep the field: a force having been sent against them, they suddenly retired into Scotland, in the month of December 1569. The former of these noblemen having entered Liddaldale, was seized by a band of freebooters, and delivered into the hands of the earl of Moray, who detained him as a prisoner in Lochleven castle. A short time before his assassination, the regent intimated to the ministers of Elizabeth that the earl of Northumberland, and other Englishmen then in Scotland, had mentioned the bishop of Ross as having been cognizant of their designs, and having encouraged them by the promise of obtaining money from foreign princes. In consequence of this information, he was placed under arrest, and was detained in custody for six weeks before he was subjected to any examination. In March 1570 he was brought before the council at Hampton Court, and confidently denied the charge; but what is directly denied in the account of his Negotiations, is virtually admitted in the narrative of his life. He did not recover his liberty till after a further detention of two months, and he was speedily involved in fresh troubles. Ridolfi, a papal emissary, was employed in conducting certain negociations between the Scottish queen, the duke of Norfolk, and the duke of Alva. At Brussels he had entrusted Charles Baily, a Flemish servant of the queen's, with a packet of letters addressed to Mary herself, to Norfolk, Lesley, the Spanish ambassador, and Lord Lumley. Instead of obeying the bishop's injunctions, by leaving the packet with the captain of Calais, this messenger retained it in his own possession; and having been searched at Dover, all his papers and books were seized, and he was himself committed to the Marshelsea. Among the books were some copies of the bishop's defence of Mary's honour, and her right of succession to the crown of England. By means of Lord Cobham, warden of the Cinque Ports, he had sufficient influence and dexterity to obtain possession of the most material letters, and having "others made to their quantitie and similitude," these were transmitted to the council. Of this substitution he contrived to make the prisoner duly aware, in order to allay his fears, and to prevent him from making any dangerous disclosures; for his alarm had been so great that he plainly declared he was the bearer of letters which would cause himself and many others to be hanged. Being now recovered from his agitation, he refused to divulge any material fact on his first examination; but on being sent to the Tower, and placed upon the rack, he avoided the torture by a full confession of his transactions with Ridolfi, and by a statement of the letters having been conveyed to the bishop of Ross. Of this confession the bishop obtained secret intelligence, and he lost no time in preparing himself against its consequences. Only one individual, John Cuthbert, his chief secretary, was acquainted with his ciphers and secret writings: he was immediately sent to a place of safety, and after being concealed four months in London, was secretly conveyed to France. The ambassador took care that no dangerous papers should be found in the search which he now anticipated. In the mean time, his labours, anxieties, and disappointments had severely affected his health, though for the last thirty years he had not been visited with any sickness. For nearly three months he was afflicted with a fever or ague, and was attended by two of the best physicians in London. On the 13th of May 1571, while his malady was still unabated, four members of the council, the earl of Sussex, Lord Burleigh, Sir Walter Mildmay, and Sir Ralph Sadler, came to his residence, and began to interrogate him respecting the facts disclosed by the intercepted messenger. He averred that he was accountable to his royal mistress, and would not admit any other responsibility. They did not fail to enquire for Cuthbert, but found that he could not be traced. They then removed all his servants, except two who were left to attend him during his illness; and two gentlemen of good credit, named Shipworth and Kingsmill, were appointed to remain with their own servants in charge of the ambassador and his house. His papers were carefully examined, and his study was locked and sealed. On the following day, afflicted as he was, he was conveyed in a chariot of the queen's to Ely House in Holburn, and was there committed to the keeping of the two gentlemen already mentioned, and of the bishop of Ely's own retinue. When his health was somewhat restored, he was on five different occasions examined before the privy council. The key of his study was at length restored to him; and on the 17th of August he was commanded to accompany the bishop to the country, being permitted to retain five of his own servants, who were to attend their master wherever the English prelate should travel or reside.

The duke of Norfolk, after having been set at liberty, was a second time committed to the Tower; and the investigation of his alleged acts of treason led to further discoveries respecting the bishop of Ross's participation in his designs. An order was despatched to the Isle of Ely, directing Bishop Cox to send his prisoner to London. There he accordingly arrived on the 19th of October, and was first detained in the house of the lord mayor. Several members of the council, the earl of Bedford, the lord admiral, Lord Burleigh, Sir Francis Knowles, and Sir Thomas Smith, accompanied by the attorney and solicitor general, came to interrogate him on the twenty-fourth of that month, and treated him with the utmost harshness, threatening him with the rack and the gallows. He pleaded the privileges of an ambassador, and, producing the queen of England's safeconduct, appealed to his royal mistress as the only competent judge of his conduct dur-

Lesley, John.

ing his embassy. He was nevertheless sent to the Tower, where he appears to have been treated with great and unnecessary rigour. "At my entry into the Towre," he states, "I was received by the leivetenant, and placed in a prison called the bloudie towre, a very evill ayred and infected house (where noe man of honest callinge had bin kepid manic yeres before) with close windowes and dores with manie locks and bolts, which was torment sufficient enough for any livinge man that had bin all his daies at libertie, with a cockshott, as they call it, sett up without, right against my windowe, to keepe all light and sight from me. And at my first entres I was searched in all parts, and such paper and inke, as was in my companie, taken from me, which was another greife. And in this manner I was straytly and closely kept, and noe man had recourse unto me, but onely the leivetenant himselfe, duringe the whole time I was a prisoner." Of his subsequent treatment, of his different examinations, and of the various attempts to draw from him information which might either criminate himself or others, he has given a circumstantial and interesting detail in his Negotiations.

Dr Wilson, master of the requests, was sent to him for the purpose of inducing him to become a witness against the duke of Norfolk, and to deliver certain letters which he had himself received from Ridolfi and others, and which were to be produced in evidence at the trial; but the bishop again relied upon his character as an ambassador, and, according to his own statement, refused either to appear as a witness, or in any other way to furnish information which might tend to the prejudice of any individual. This unfortunate nobleman was convicted of high treason on the 16th of January, and was brought to the scaffold on the 2d of June, 1572. The rules of evidence were at that period little understood, and less regarded, nor was it necessary to produce the witnesses in court, provided there was any other method of rendering their depositions available: previous answers to interrogatories, the declarations or admissions of the prisoner or other individuals, were all received as the most legitimate evidence; and in fact the trial of the duke of Norfolk before his peers, was entirely conducted without the aid of parole testimony. The bishop of Ross, whose name was perpetually mentioned in the course of the proceedings, may be considered as the principal witness against him; for of all the most material charges the proof seems in a great measure to have rested on what are described as the bishop's confessions, that is, the answers emitted during his repeated examinations after he had himself been taken into custody.[1] On perceiving that all their designs were discovered, Lesley had become more communicative, and had thus contributed to the ruin of a man whom he had so much contributed to entangle in dangerous schemes of ambition.

While he was beset with such perils in England, the regent sent Nicholas Elphinstone with a demand that he should be conveyed to Scotland; a demand which he considered as a sufficient indication of the treatment that awaited him in his native country. But the duke of Montmorency having arrived from France on a special mission, brought instructions from the king to intercede for his release; and this application was so far successful as to procure his removal to Farnham castle, the seat of the bishop of Winchester. The lieutenant of the Tower charged for his maintenance the sum of two hundred pounds, which was advanced by the French ambassador, and repaid by Mary: he likewise retained as a lawful perquisite the whole of the furniture and silver plate which the prisoner had brought for his own use; and finally, says Lesley, "the gentleman-porter of the Tower retained my satin gown as due to him, because it was my uppermost cloth when I entred." Being only permitted to take one attendant, he selected Thomas Lesley, a secretary who had resided with him during his captivity, and had himself been subjected to a short imprisonment. In the castle of this prelate, Dr Horne, he has stated, "I remained the space of a year and three moneths, and all that time was very straitly keept, and two gentlemen did continually wait upon me night and day, and had no liberty to speake to any other his servants but in their presence, nor yet with any other but in my Lord of Winchesters own presence; yet in all other things I was very honourably and friendly used by him."

During his confinement in the Tower, he had sought for consolation in study and meditation. There he had composed his *Piæ Consolationes;* and he was now permitted to transmit them to the queen, who needed consolation still more than her ambassador. From this pious treatise she derived so much gratification, that she devoted some of her prison hours to the task of transfusing a portion of it into French verse. He was induced to prepare a similar work, *Animi tranquilli Munimentum,* which he sent to her on the 1st of October 1573, and had again the satisfaction of finding that his labours were duly appreciated. In the mean time, he was not free from the apprehension of personal danger; the earl of Morton having twice sent a diplomatic agent, Captain Cockburn, for the purpose of renewing the demand for the delivery of his person. Having some reliance upon his own eloquence, he now addressed to Elizabeth a Latin oration for the recovery of his liberty; and, whatever might be the effect of his classical pleading, he was soon afterwards released from his tedious confinement. The bishop of Winchester, on receiving the necessary order, conducted him to London on the 11th of November. On the sixteenth, he was brought before the council, at the house of the lord treasurer, and was informed that he would be permitted to proceed either to Scotland or France. That Lesley had been deeply implicated in transactions which would justly have exposed a subject to punishment, there seems little or no reason to dispute: the state-papers, as well as the histories of that period, exhibit him in the light of a subtle, restless, and dangerous plotter, who resorted to a great variety of expedients for promoting the interest of the unfortunate queen. The English statesmen seem to have been much inclined to treat him as they ultimately treated Mary herself; and in 1571 they had submitted his case to the opinion of five learned civilians, Lewis, Dale, Drury, Aubrey, and Jones.[2] In answer to one of the questions propounded, they declared, that, according to the law of nations, as well as the civil law, an ambassador who excites rebellion against the sovereign to whom he is sent, forfeits all his privileges, and may be subjected to punishment. But among the more civilized nations it has very generally been regarded as the safest maxim, rather to spare a delinquent than not to spare an ambassador;[3] and although he was thus subjected to a long and arbitrary imprisonment, the ministers of Elizabeth had never ventured to bring him to a formal trial.[4]

Lesley, John.

In the month of January 1574 he landed in France, and there he remained till the following year, when Mary thought it expedient to send him on a mission to Rome. He experienced a very gracious reception from Gregory the Thirteenth, who in a great measure defrayed his expenses during the three years of his residence in that holy city. Besides the release of the queen from captivity, her ambassador's instructions related to various other matters, connected with her joint interest and that of the popish faith. The great object to be attained was her restoration to the throne; and with the view of removing some of the obstacles, she was willing to admit her son to a participation of the royal dignity; but in order to render him worthy of being thus associated, some scheme was to be devised for conveying him to a catholic country, and uniting him in marriage either with a daughter of the emperor of Germany or the king of Spain.

Lesley was more usefully employed in preparing for the press his general history of Scotland, which was published at Rome in the year 1578. It is dedicated to the pope, and the epistle dedicatory is followed by an address to Cardinal Cajetano, described as protector of the Scotish nation. Among the commendatory verses inserted in the volume, we find the contributions of Muretus, Ninian Winzet, and Alexander Seton, afterwards earl of Dunfermline, and chancellor of Scotland.[1] These elegant studies of the author were speedily interrupted by a new mission. Hopes were now entertained that the ancient faith might be restored in Scotland by the power and influence of the earl of Athole; and with the view of watching any favourable change of affairs, the pope directed the bishop of Ross to proceed towards the coast of France adjacent to Britain. His holiness having appointed him to supply the place of a nuncio who had recently died at the imperial court, Lesley travelled through Germany, and remained for some time at Prague, where Maximilian was then residing. His instructions from Mary partly related to the Scotish monasteries founded in Germany; some of which having been seized by heretics and other evil disposed persons, he exerted his influence to procure their restoration to the Scotish monks. Monastic institutions have often been the strongholds of political, as well as moral misrule; nor is it difficult to discern the spirit which dictated this ambassador's instructions. He visited the duke of Bavaria, and other catholic princes of the empire, and was every where well received till he arrived at Falsburg, a town near Strasburg, where he was seized by some officers with a guard of four hundred men, under the command of a protestant nobleman, George Cassimir of Littelsteyn. For the space of nearly two months, he was detained in the castle of Falsburg; but they at length discovered their mistake in supposing him to be the archbishop of Rossana, a papal legate; and on paying a considerable sum of money, he was permitted to prosecute his journey. Passing through Lorraine, he arrived in France, and had there the mortification to receive intelligence of the earl of Athole's sudden death, which took place on the 24th of April 1579. It was some consolation that the Cardinal de Bourbon, archbishop of Rouen, soon afterwards appointed him suffragan and vicar general of that diocese. In this station he continued for the space of fourteen years. The kingdom was then devastated by civil war, and he naturally adhered to the party of the leaguers, who, with the view of excluding Henry of Navarre, proclaimed the old cardinal king in the year 1589. While visiting this diocese in the course of the following year, Lesley was intercepted and cast into prison; and in order to pay a ransom of nearly three thousand pistoles, he was under the necessity of selling his furniture and other goods. The city of Rouen was invested in 1591, and during the siege he is said to have exerted himself with great perseverance and resolution in encouraging the governor, officers, and citizens. As a reward of his services, the duke of Mayenne recommended him to Clement the Eighth as well qualified to fill the vacant bishopric of Coustance in Normandy. The pope issued the necessary bulls, accompanied with an unavailing licence to retain the see of Ross till he should be put in possession of his new diocese; and he was graciously pleased to remit the annats, or first fruits, and other payments which usually attend a bishop's promotion. As he could not safely present himself at his episcopal seat, the ceremony of his admission was in the year 1594 performed in the metropolitan church of Rouen.

But from this preferment he appears to have derived no advantage; and the unhappy situation of public affairs in France induced him to seek another place of refuge. Directing his course towards Flanders, he reached Château d'Aussy in the province of Artois, in the month of March, and afterwards proceeded to Brussels, where he experienced a friendly reception from the archduke Ernest, governor of the Netherlands. Of the history of Scotland, he had at an earlier period transmitted a copy to his catholic majesty, who testified its gracious reception by a letter, written in Latin, and bearing the royal signature. On this occasion he had promised to be mindful of the bishop's private affairs. On the day before her execution, Mary had addressed to Philip a letter in which she recommended her son to his special protection; and she likewise requested him to bear in remembrance the faithful services which had been rendered to her by the bishop of Ross. He directed the prince of Parma, then governor of the Netherlands, to bestow upon him the first bishopric or other prelacy that should become vacant in these provinces, and in the mean time to provide for him a suitable maintenance. The prince had accordingly assigned to him a pension of fifty crowns a month, to be computed from the first of June 1587; and this pension still continued to be paid, though not with sufficient regularity to prevent him from being exposed to occasional difficulties. The archbishopric of Mechlin having become vacant, the archduke and the council of state recommended him to Philip for this high preferment; but the design seems to have been frustrated, partly by the unexpected demise of Ernest, who, almost in the article of death, signified to the council his wish that Lesley's suit should not be neglected. He was encouraged by the nobility and counsellors to await the arrival of the new governor, Cardinal Albert, another archduke of Austria, brother to the deceased; and in order to smooth the path of preferment, he prepared a congratulation, which was not however published till after the death of the author. Part of the summer of 1595 he spent at Spa for the benefit of his declining health, and, as we are informed, "not without great inconvenience, and even the danger of his life, by the incursions of the hereticks and the rebels of Holland; who crowding in those parts, robbed him of all his goods, and endeavoured to seize his person, that they might carry it off." But all his personal dangers, as well as his schemes of ambition, were terminated at Brussels on the 31st of May 1596, when he died in the sixty-ninth year of his age.[2]

---

[1] An epigram in commendation of Lesley occurs among the poems of Joannes Gesseus, in the Delitiæ Poetarum Gallorum, tom. i. p. 934.

[2] Dodd has recorded his pious benefactions to the church. "He laid the foundation of three colleges for the education of cler-

Bishop Lesley was evidently a man of very superior talents for literature as well as business. His studies and pursuits had been those of a lawyer and statesman, rather than a theologian; and his intellect had been much exercised and whetted by a long course of diplomatic services, of a peculiarly delicate and dangerous nature. With the accomplishments of an elegant scholar, he united the dexterity of a man of the world. He is the author of various works, and several of these must still be considered as valuable. His defence of Queen Mary's honour is written with no small acuteness and address: the task which he had undertaken was sufficiently formidable; if the queen was not guilty of adultery and murder, her conduct had at least exhibited the strongest indications of guilt; but this zealous and able champion shrinks from no difficulties, and is undismayed by the most prominent obstacles. His negociations contain some characteristic details, and furnish some curious materials for history. But the most conspicuous of his works is his Latin history of Scotland, which is written with a very considerable degree of elegance, and, in the more recent portion of it, supplies much important information. The work is divided into ten books; of which the first seven, ending with the reign of James the First, comprehend little more than an abridgement of Boyce. As he descends to his own times, he becomes much more copious and interesting. With the transactions of Mary's reign, which he has not however prosecuted beyond the year 1562, he had peculiar opportunities of becoming familiarly acquainted; and it is useful, as well as interesting, to compare the statements and reflections of Lesley and Buchanan, the most distinguished adherents of the popish and protestant parties.

Of the works of Lesley we subjoin a catalogue, accompanied with a few notices, chiefly bibliographical.

1. A Defence of the Honour of the right highe, mightye, and noble Princesse Marie, Queene of Scotlande, and Dowager of France; with a Declaration aswell of her Right, Title, and Intereste to the Successioun of the Crowne of Englande, as that the Regimente of Women ys conformable to the Lawe of God and Nature. Imprinted at London in Flete Strete at the signe of Iustice Royall against the Blacke Bell by Eusebius Dicæophilus, anno Dom. 1569, 8vo. A Treatise concerning the Defence of the Honovr, &c. Made by Morgan Philippes, Bachelar of Diuinitie, an. 1570. Leodii, apud Gualterum Morberium, 1571, 8vo. Here the tract relating to the succession bears the following title: "A Treatise tovching the Right, Title, and Interest of the mightie and noble Princesse Marie, Queene of Scotland, to the Succession of the Croune of England. Made by Morgan Philippes, Bachelar of Diuinitie, assisted with the aduise of Antonie Broune, Knight, one of the Iustices of the Common Place. An. 1567." This treatise he afterwards translated into Latin, as well as French, and likewise published the original in a separate form. "De Titulo et Jure serenissimæ Principis Mariæ Scotorum Reginæ, quo Regni Angliæ Successionem sibi juste vendicat, Libellus," &c. Rhemis, 1580, 4to. "A Treatise towching the Right, Title, and Interest," &c. *An.* 1584, 8vo. "Du Droict et Tiltre de la serenissime Princesse, Marie Royne d'Escosse, et de tres illustre Prince Iacques VI. Roy d'Escosse son fils, à la Succession du Royaume d'Angleterre: avec la Genealogie des Roys d'Angleterre ayans regné depuis cinq cens ans. Premierement composé en Latin et Anglois, par R. P. en Dieu M. Iean de Lesselie, Euesque de Rosse, Escossois, lors qu'il estoit Ambassadeur en Angleterre pour sa Majesté, et nouuellement mis en François par le mesme Autheur." Rouen, 1587, 8vo. The same work was also translated into Spanish, under the title of "Declaracion del Titulo y Derecho que la serenissima Princesa Doña Maria Reina de Escosia tiene a la Sucesion de Inglaterra."[1] The defence of the queen's honour, from the edition of 1571, is reprinted in Anderson's Collections, vol. i. and the Latin version of the tract on the right of succession in those of Jebb, "De Vita et Rebus gestis Mariae Scotorum Reginae Autores sedecim," tom. i. Lond. 1725, 2 tom. fol. Of his tract on female government he also published a Latin translation. "De illustrium Foeminarum in Repub. administranda, ac ferendis Legibus, Authoritate, Libellus," &c. Rhemis, 1580, 4to. This tract was occasioned by Knox's "First Blast of the Trumpet against the monstrvovs Regiment of Women," published in 1558. His vindication of the queen's right of succession was written in answer to a book published in 1560 by John Hales, clerk of the hanaper. Lesley writes in the character of an Englishman, and therefore borrows the name of Morgan Philips, who was a popish priest of Douay. In order to maintain his assumed character with more propriety, he submitted the manuscript to his friend and physician Dr Good, "that he might turn into English any Scottish words in it."[2]

2. Joannis Leslæi Scoti, Episcopi Rossen. pro Libertate impetranda, Oratio, ad serenissimam Elizabetham Angliæ Reginam. Parisiis, 1574, 8vo. This oration is reprinted in Nichols's "Progresses of Queen Elizabeth," vol. iii.

3. Joannis Leslæi Scoti, Episcopi Rossen. libri duo: quorum uno, Piæ afflicti Animi Consolationes, divinaque Remedia; altero, Animi tranquilli Munimentum et Conservatio, continentur. Ad serenissiman Principem D. Mariam Scotorum Reginam. His adjecimus ejusdem Principis Epistolam ad Rossensem Episcopum, et Versus item Gallicos Latino carmine translatos, pias etiam aliquot Preces, &c. Parisiis, 1574, 8vo.

4. De Origine, Moribus, et Rebus gestis Scotorum libri decem: e quibus septem veterum Scotorum res in primis memorabiles contractius, reliqui vero tres posteriorum regum ad nostra tempora historiam, quæ hucusque desiderabatur, fusius explicant. Accessit nova et accurata Regionum et Insularum Scotiæ, cum vera ejusdem tabula topographica, Descriptio. Authore Joanne Leslæo, Scoto, Episcopo Rossensi. Romæ, 1578, 4to. Nunc denuo recus. anno Domini 1675, 4to. This latter edition, which is said to have been printed in London, contains a dedication to the earl of Rothes, subscribed by a George Lesley. That portion of the history which relates to the reign of Mary, is inserted in the collection of Dr Jebb, tom. i.

5. Congratulatio serenissimo Principi et illustrissimo Cardinali Alberto Archiduci Austriæ, &c. de fausto ac felici

---

gymen, to be sent upon the mission, after the example of Dr Allen, as I find by letters between them upon that subject. Having compleated the establishment of a college for his countrymen in Paris, he gave a beginning to another at Rome, with a subsistence for about ten students; where the Jesuits stept in to be managers. This zealous bishop died in the year 1596, leaving behind him a sum of money towards the foundation of a third college, also for the clergy. The design could not be brought to bear till 1609, when a small community was set up at Antwerp, whereof the Jesuits were made superiors. But before matters could be entirely compleated, it was removed to Doway *an.* 1612, and governed by Walloon Jesuits, till one Curle (son to Mr Curle, formerly secretary to Mary queen of Scots) becoming a Jesuit, and bringing with him an addition of 5000 florins to the original stock, he was made rector of the college about 1620. Since that time the superior has been a Scotch Jesuit. Very few clergymen were educated there afterwards, and of latter years none at all; the old fund, as may be supposed, being swallowed up by the latter addition." (Church History of England, from the year 1500 to the year 1688, vol. ii. p. 42. Brussels, 1737-42, 3 vols. fol.)

[1] Antonii Bibliotheca Hispana, tom. ii. p. 354.

[2] Anderson's pref. to Lesley's Defence, p. xi.

ejus Adventu ad Regimen Provinciarum Inferioris Germaniæ. Per R. in Christo P. Joan. Leslæum, Episcopum Rossensem, Scotum. Subjicitur series vitæ suæ. Bruxellæ, 1596, 8vo. This little work is reprinted in Anderson's Collections, vol. i. Of the account of the author's life, a translation is inserted in vol. iii.

6. A Discourse conteyninge a perfect Accompt given to the moste vertuous and excellent Princesse, Marie Queene of Scots, and her Nobility, by John Lesley, Bishop of Rosse, Ambassador for her Highnes toward the Queene of England, of his whole Charge and Proceedings during the time of his Ambassage, from his entres in England in September 1568, to the 26th of March 1572. This account of the bishop's negociations, which extends to 252 pages, was printed, for the first time, in Anderson's Collections relating to the History of Mary Queen of Scotland, vol. iii. Edinb. & Lond. 1727–8, 4 vols. 4to. As the language was Anglicized by Dr Good, it may be presumed that Lesley intended the work for immediate publication.

7. The History of Scotland, from the death of King James I. in the year M.CCCC.XXXVI. to the year M.D.LXI. By John Lesley, Bishop of Ross. Edinburgh, 1830, 4to. This valuable relique was edited by Thomas Thomson, Esq. from a MS. belonging to the earl of Leven and Melville. Prefixed is a portrait of the author, copied from an old engraving, and representing him as a man of a dignified and sagacious aspect. Of his Scotish history the Latin is not a mere translation. "The readers of this volume," as the editor has remarked, "who may take the trouble of comparing it with the Latin version, will readily perceive that the alterations made by the author on his own original sketch do not consist merely in correction and enlargement; but that, in numerous instances, he has been induced to suppress or generalize those more minute details and domestic occurrences which he may have found less susceptible of that classic attire in which he was naturally ambitious of exhibiting his historical work. In this respect, the present publication may be found to contribute some few particulars to the materials of our national history; but a still higher value will probably be attached to it as a specimen of pure and vigorous composition, in his native language, by one of the most able and accomplished Scotchmen of the sixteenth century." (x.)

LESLIE, CHARLES, was the second son of Dr John Leslie, bishop of Clogher, in Ireland, who was descended from an ancient family in the north of Scotland, and, being an admirable scholar, rose to the dignity of bishop of Orkney in his own country, whence he was, in the year 1633, translated to Raphoe, and afterwards, in 1661, to the see of Clogher, in Ireland.

Our author was born in Ireland, but in what year we have not learned. There is a ludicrous story, indeed, of his having been begotten in prison, and of his father having said that he hoped he would in consequence become the greatest scourge of the covenanters that Great Britain or Ireland had ever seen. This story, with all its circumstances, can scarcely be true; but we think it could not have been fabricated, had not Charles Leslie been born within a year of Cromwell's conquest of Ireland, when the good bishop, having sustained a siege in his castle of Raphoe, was some time kept in close confinement.

We are equally ignorant of the school where he was educated as of the year of his birth; but we know that he received his academical education in Trinity College, Dublin, where he took the degree of master of arts. In the year 1671, he lost his father, when he came over to England, and, entering himself in the temple, studied law for some years, but afterwards relinquished it for the study of divinity. In 1680 he was admitted into holy orders, and, in 1687, was made chancellor of Connor.

About this period he rendered himself particularly obnoxious to the Catholic party in Ireland, by his zealous opposition to them, which was thus called forth. Roger Boyle, bishop of Clogher, dying in 1687, Patrick Tyrrel was made Catholic bishop, and had the revenues of the see assigned him by King James. He set up a convent of friars in Monaghan, and, fixing his habitation there, held a public visitation of his clergy with great solemnity; when, some subtile logicians attending him, he challenged the Protestant clergy to a public disputation. Leslie undertook the task, and performed it to the satisfaction of the Protestants; though it happened, as it generally does at such contests, that both sides claimed the victory. He afterwards held another public disputation with two celebrated Catholic divines, in the church of Tynan, in the diocese of Armagh, before a very numerous assembly of persons of both religions; the issue of which was, that Mr John Stewart, a Catholic gentleman, renounced the church of Rome.

As the Catholics had got possession of an Episcopal see, they engrossed other offices also; and a Catholic high-sheriff was appointed for the county of Monaghan. This proceeding alarmed the gentlemen in that county, who, depending much on Leslie's knowledge as a justice of peace, repaired to him, then confined, by the gout, to his house. He told them, that it would be as illegal in them to permit the sheriff to act as it would be in him to attempt it. But they insisting that he should appear himself on the bench at the next quarter-sessions, and all promising to stand by him, he was carried thither with much difficulty and in great pain. When the sheriff appeared, and was taking his place, he was asked whether he was legally qualified; to which he answered smartly, "That he was of the king's own religion, and it was his majesty's will that he should be sheriff." Leslie replied, "that they were not inquiring into his majesty's religion, but whether he (the pretended sheriff) had qualified himself according to law, for acting as a proper officer; that the law was the king's will, and nothing else to be deemed such; that his subjects had no other way of knowing his will, but as it is revealed to them in his laws; and it must always be thought to continue so, till the contrary is notified to them in the same authentic manner." Upon this the bench unanimously agreed to commit the pretended sheriff, for his intrusion and arrogant contempt of the court. Leslie also committed some officers of the army which the Lord Tyrconnel raised, for offences.

By this spirited conduct Leslie acted like a sound divine and an upright magistrate; but though he thought himself authorized to resist the legal mandates of his sovereign, like many other great and good men, he distinguished between active and passive obedience, and felt not himself at liberty to transfer his allegiance from that sovereign to another. Refusing therefore to take the oaths to King William and Queen Mary, he was deprived of all his preferments; and in 1689 he removed with his family to England, where he published the following amongst other works: 1. Answer to Archbishop King's State of the Protestants in Ireland. 2. Cassandra, concerning the new Associations, &c. 1703, 4to. 3. Rehearsals; at first a weekly paper, published afterwards twice a week in a half-sheet, by way of a dialogue on the affairs of the times; begun in 1704, and continued for six or seven years. 4. The Wolf stripped of his Shepherd's Clothing, in Answer to Moderation a Virtue, 1704, 4to. The pamphlet it answers was written by James Owen. 5. The Bishop of Sarum's [Burnet's] proper Defence, from a Speech said to be spoken by him against occasional Conformity, 1704, 4to. 6. The new Association of those called Moderate Churchmen, &c. occasioned by a pamphlet entitled The Danger of Priestcraft, 1705, 4to. 7. The new Association, part ii. 1705, 4to. 8. The Principles of Dissenters concerning Toleration and occasional Conformity, 1705, 4to. 9. A Warning for the Church of England, 1706, 4to. Some have doubted whether these two pieces were his. 10. The good old Cause, or Lying in Truth, being a second Defence of the Bishop of Sarum from a second Speech, &c. 1710. For this a warrant was issued out against Leslie. 11. A Letter to the Bishop of Sarum, in Answer to his Sermon after the Queen's Death, in Defence of the Revolution, 1715. 12. Salt for the Leech. 13. The Anatomy of a Jacobite. 14. Gallienus Redivivus. 15. Delenda Carthago. 16. A Letter to Mr William Molyneux, on his Case of Ireland's being bound by the English Acts of Parliament. 17. A Letter to Julian Johnson. 18. Several Tracts against Dr Higden and Mr Hoadly. 19. A Discourse, showing who they are that are now qualified to administer Baptism. 20. The History of Sin and Heresy, &c. 1698, 8vo. 21. The Truth of Christianity demonstrated, in a Dialogue between a Christian and a Deist, 1711, 8vo. 22. Of private Judgment and Authority in Matters of Faith. 23. The Case stated between the Church of Rome and the Church of England, 1713. 24. The true notion of the Catholic Church, in Answer to the Bishop of Meaux's Letter to Mr Nelson. Besides these, he published the four following tracts: 25. A Sermon preached at Chester, against Marriages in different Communions, 1702, 8vo. This sermon occasioned Mr Dodwell's Discourse upon the same subject. 26. A Dissertation concerning the Use and Authority of Ecclesiastical History. 27. The Case of the Regal and the Pontificate. 28. A Supplement in Answer to a Book entitled The Regal Supremacy in Ecclesiastical Affairs asserted. These last two pieces were occasioned by the dispute about the right of convocation, between Wake, &c. on one side, and Atterbury and his friends, amongst whom was Leslie, on the other.

It is said by the authors of the *Biographical Dictionary*, that, in consequence of a publication of his, entitled "The Hereditary Right of the Crown of England asserted," he was under the necessity of leaving the kingdom; and that he repaired to the Pretender at Bar-le-duc, where he was allowed to officiate, in a private chapel, according to the rites of the church of England, and where he endeavoured, though in vain, to convert the Pretender to the Protestant religion.

That he repaired to Bar-le-duc, and endeavoured to convert to the faith of the church of England him whom he considered as the rightful sovereign of England, is indeed true; but there is reason to believe that this was not in consequence of his being obliged to leave the kingdom. In the first place, it is more than probable that "The Hereditary Right of the Crown of England asserted" was not written by Leslie; and there is still in existence undoubted evidence, that, in consequence of his great fame as a polemic, he was sent to Bar-le-duc for the express purpose of endeavouring to convert the son of James II., by some gentlemen of fortune in England, who wished to see that prince seated upon the throne of his ancestors. The writer of this article had the honour to be well known to the grand-daughter of one of those gentlemen, a lady of the strictest veracity; and from her he received many anecdotes of Leslie and his associates, which, as he did not then foresee that he should ever have any occasion to use them, he has suffered to slip from his memory. That lady, we have reason to believe, was in possession of many letters by Leslie, written in confidence to her grandfather, both from Bar-le-duc and from St Germains; and by the account which she gave of these letters, Leslie appears to have considered his prince as a weak and incorrigible bigot, though, in every thing but religion, an amiable and accomplished man. This may have been his genuine character, for we know very well that it was the character of his father; but it is not of him that we are now writing.

Mr Leslie having remained abroad from the year 1709 till 1721, returned that year to England, resolving, whatever the consequences might be, to die in his own country. Some of his friends having acquainted Lord Sunderland with his purpose, implored his protection for the good old man, which his lordship readily and generously promised. Mr Leslie had no sooner arrived in London, than a member of the House of Commons officiously waited on Lord Sunderland with the news, but met with such a reception from his lordship as the malice of his errand deserved. Our author then went over to Ireland, where he died, on the 13th of April 1722, at his own house at Glaslough, in the county of Monaghan.

His character may be summed up in a few words. Consummate learning, attended by the deepest humility, the strictest piety without the least tincture of moroseness, a conversation in the highest degree lively and spirited, yet to the last degree innocent, made him the delight of mankind; and has left what Dr Hickes says of him unquestionable, that he made more converts to sound faith and a holy life than any other man of his time.

A charge, however, has been brought against him, which, if well founded, must detract not only from his literary fame, but also from his personal integrity. *The Short and Easy Method with the Deists* is unquestionably his most valuable, and apparently his most original work; yet this work has been published in French amongst the works of the Abbé St Real, who died in 1692; and therefore it has been said, that unless it was published in English prior to that period, Charles Leslie must be considered as a shameless plagiary.

The English work was certainly not published prior to the death of the Abbé St Real, for the first edition bears date the 17th of July 1697; and yet many reasons conspire to convince us that our countryman was no plagiary. There is indeed a striking similarity between the English and the French works; but this is no complete proof that the one was copied from the other. The article PHILOLOGY in this Encyclopædia, of which the late Dr Doig of Stirling was the author, was published the very same week in which Dr Vincent's dissertation on the Greek verb appeared. It was therefore impossible that either of these learned men, who till then were strangers to each other's names, could have stolen aught from the other; and yet Dr Vincent's derivation of the Greek verb bears as striking a resemblance to that of Dr Doig as the Abbé St Real's work does to that of Charles Leslie. In the article MIRACLE, too, the credibility of the gospel miracles is established by an argument, which the author certainly did not borrow from any one, and which the late Principal Campbell of Aberdeen considered as original; yet within half a year of the publication of that article, the credibility of the gospel miracles was treated in the very same manner by Dr Sayers, though there is in his dissertation complete internal evidence that he had not seen the article in this Encyclopædia. Further, the author of this sketch reviewed, in one of the Journals, the work of a friend, which was at the same time reviewed in another Journal which he never saw. Yet he was told by a friend, who was conversant in that kind of reading, and knew nothing of his concern with either Journal, that the book in question must, in both, have been reviewed by the same hand, because in both the same character was given of it in almost the very same words.

After these instances of apparent plagiarism, and which we know to be only apparent, has any man a right to say that Charles Leslie and the Abbé St Real might not have treated their subject in the way that they have done, without either borrowing from the other? The coincidence of arrangement and reasoning in two different works is indeed very surprising; but it is by no means so surprising as the coincidence of etymological deductions which appear in the writings of Drs Doig and Vincent. The divines reason from the acknowledged laws of human thought; the reasonings of the grammarians, with all deference to their superior learning, we cannot help considering as sometimes a little fanciful.

But this is not all that we have to urge on the subject. If there be plagiarism in the case, and the identity of titles looks very like it, it is infinitely more probable that the editor of St Real's works stole from Leslie, than that Leslie stole from St Real; unless it can be proved that the works of the abbé, and this work in particular, were published before the year 1697. At that period the English language was very little read or understood upon the Continent, whilst in Britain the French language was, by scholars, as generally understood as at present. Hence it is, that so many Frenchmen, and indeed foreigners of different nations, thought themselves safe in pilfering from the British philosophers; whilst there is not, in as far as we know, one well authenticated instance of a British philosopher appropriating to himself the discoveries of a foreigner. Is it then very improbable that the editor of the works of St Real would claim to his friend a celebrated tract, of which he knew the real author to be obnoxious to the government of his own country, and therefore not likely to have powerful friends to maintain his right?

But further, Dr Burnet, bishop of Sarum, was an excellent scholar, and well read, as every one knows, in the works of foreign divines. Is it conceivable, that this prelate, when smarting under the scourge of Leslie, would have let slip so favourable an opportunity of covering with disgrace his most formidable antagonist, had he known that antagonist to be guilty of plagiarism from the writings of the Abbé St Real? Let it be granted, however, that Burnet was a stranger to these writings and to this plagiarism; it can hardly be supposed that Le Clerc was likewise ignorant of them. Yet this author—when, for reasons best known to himself, he chose, in the year 1706, to depreciate the argument of Leslie's *Short and Easy Method*, and to traduce its author as ignorant of ancient history, and as having brought forward his four marks for no other purpose than to put the deceitful traditions of popery upon the same footing with the most authentic doctrines of the gospel—does not so much as insinuate that he had borrowed these marks from a popish abbé, though such a charge, could he have established it, would have served his purpose more than all his rude railings and invective. But there was no room for such a charge. In the second volume of the works of St Real, published in 1757, there is indeed a tract entitled *Méthode Courte et Aisée pour combattre les Deistes;* and there can be little doubt but that the publisher wished it to be considered as the work of his countryman. Unfortunately, however, for his design, a catalogue of the abbé's works is given in the first volume; and in that catalogue the *Méthode Courte et Aisée* is not mentioned.

We have dwelt thus long on *The Short and Easy Method with the Deists*, because it is one of the ablest works that ever was written in proof of the divine origin of the Jewish and Christian Scriptures; a work of which the high merit was acknowledged even by Lord Bolingbroke, and which, as is well known to theological scholars, Dr Conyers Middleton confessed to be unanswerable. If by men of science we should be thought to have spent our time well in vindicating the rights of some of our illustrious philosophers, to discoveries which have been unjustly claimed for the philosophers of Germany and France, we will not surely, by the friends of Christianity, be thought to have employed our time ill in vindicating Leslie's claim to this decisive argument in support of our holy religion.

Leslie, *Sir John*, Professor of Natural Philosophy in the University of Edinburgh, and author of several scientific works, inventions, and discoveries, of great celebrity, was born at the village of Largo, in the county of Fife, on the 16th of April 1766. If, in sketching the Life of this eminent person, we should happen to exceed the usual limits of our biographical notices, we can at least plead in excuse that we have done so in the case of one of the greatest benefactors of this Encyclopædia—one whose counsels led to not a few of the improvements which distinguish the later years of its history, and to whom it is indebted for many contributions, marked with the stamp of his vigorous and original powers. It is painful to us to recollect the number of similar claims to our attention. Too many illustrious contemporary benefactors have, like him, left us the mournful duty of preserving some memorials of their personal history, in the work which received from their co-operation its highest honours and proudest recommendations.

He was the son of humble, but, in their line of life, highly respectable parents, who lived to enjoy the celebrity of their son, and for whom he ever cherished that affection which formed a marked feature of his character, in regard to all the members of his family. His father, originally from the neighbourhood of St Andrews, lived for some time at Anstruther, but ultimately settled at Largo, as a joiner and cabinet-maker. His wife, Anne Carstairs, was a native of that place; and the subject of this article was the youngest child of their marriage. Though he attained in manhood a robust frame, he was, in early youth, of a very feeble constitution; so much so, that when sent, at four years of age, to a sort of school, kept by an old woman, who plied her wheel whilst teaching the alphabet, he was indulged with a separate stool, near the fire-place, which the dame set apart for the feeblest of her juvenile pupils. As long as he was permitted to monopolize this seat of honour, he seems to have been tolerably pleased with his situation; but being at length superseded by a younger, or more favoured pupil, he eloped from the school, hid himself for a day in some obscure corner, and, when obliged to come forth, obstinately refused to return to the tutelage of the ancient spinster. He was in consequence placed in another school, where he remained six months, and was taught writing and arithmetic; his father and his eldest brother, who appear to have possessed some knowledge of the elementary parts of mathematics, giving him, at the same time, his first lessons in that science. He was afterwards entered at a school in the neighbouring town of Leven, where Latin was taught; but his intense dislike, at this time, to that language, and his inability to walk and return daily a distance of three miles, induced his parents to discontinue his attendance, after a short trial of six weeks. Such was the brief and meagre *curriculum* which formed the whole training of the future mathematician and philosopher, previous to his being entered a student at the University of St Andrews! But we must not too hastily despatch this early period of his life, when his genius, working with its own inward resources, already began to attract observation.

The first person of any sort of distinction who noticed his precocious attainments, was Mr Oliphant, who became Minister of Largo about the time when the boy had reached his eleventh or twelfth year. Struck with the knowledge in mathematical and physical science which he displayed, the reverend gentleman kindly lent him some scientific books, with which he was but poorly provided; and he also strongly urged him to study Latin,—telling him, by way of showing the necessity of an immediate commencement, that it had cost himself seven years to acquire that language. This was the worst argument that could be urged to the young philosopher, who unhesitatingly declared that he never would bestow half that time upon any language, and that he particularly disliked Latin. In this state of his knowledge and taste, he was, in his thirteenth year, sent to the University of St Andrews to study mathematics under Professor Vilant. On examination by the Professor, he was found already qualified for the second or senior class; and, at the close of the session, he obtained a prize. It is remembered, as a characteristic particular, that having previously discovered, in some of those antiquarian researches to which also he was early addicted, that it was not indispensable for students of the first year to wear a gown, he steadily refused, during this year, to exhibit himself in the accustomed academical habiliment.

This session proved a decisive one as to the course of his future studies. The Earl of Kinnoull, then Chancellor of the University, having been informed of his remarkable abilities, sent for his father, and proposed to him to defray the expense of his son's education, provided the father would agree to maintain him at college, with the view of qualifying him for the Church. The proposal was readily embraced; and the repugnance of the youth to apply himself to Latin was at length overcome, by making the permission to attend the Natural Philosophy class of next session,—the great object of his desire,—conditional on his agreeing to qualify himself, during the vacation, for attending also the Latin class. With this lure before him, he applied assiduously to his lessons, under the direction of a private teacher, and succeeded in fitting himself for admission into that class. No one could discover, in his after life, any traces of this early and vehement dislike to Latin; for though he ever held that the learned languages were suffered to engross too much attention in our system of education, and was by no means sparing of reprehension upon this subject,[1] his own scholarship had become considerable; and indeed his writings manifest a more than ordinary degree of fondness for embellishing the conclusions of science with illustrations from the Greek and Latin Classics. He continued to the last to read them occasionally, particularly Lucretius, whose bold and imaginative philosophy, and splendid descriptions, were peculiarly adapted to his taste. He came also to be well versed in the theory of grammar; and his observations upon languages often evinced learning, as well as ingenuity.

His health, at the period above alluded to, was still so delicate that it became necessary to moderate and regulate his studious habits; but he succeeded, during his second session, in acquiring additional honours, and in attracting in a more marked degree the flattering attentions of the Chancellor, who kindly invited him to Dupplin Castle, where, notwithstanding the bashfulness of his manner, he contrived to impress the other visitors with a high opinion of his powers. About the same time, he became known to Mr Playfair, on occasion of a visit which the latter, alongst with the Reverend Dr Small, made to St Andrews. Dr Small's son was a fellow-student and companion of young Leslie, and hence his introduction to both these mathematicians. Mr Playfair was at this time parish minister of Liff, in Forfarshire. Here he was afterwards visited by his young acquaintance, neither of them then dreaming of that lot which was to place them, in succession, in two conspicuous Chairs of the University of Edinburgh, destined to derive from both additional lustre and recommendations. His visits to Mr Playfair were continued after the latter, in 1782, resigned his clerical charge, in order to superintend the education of the present Robert Ferguson, Esq. of Raith, and his brother Sir Ronald. It was in this way, we believe, that he first became known to these excellent and distinguished men, then youths of his own age; and the acquaintance, in after years, ripened into a warm and lasting friendship, alike honourable to both parties, and which formed one of the chief and most valued solaces of his life.

In 1783 or 1784, he quitted St Andrews, and proceeded to Edinburgh, with the intention of entering himself a student of Divinity in the metropolitan university. He was accompanied by a fellow-student, destined, like himself, to obtain a distinguished niche in the Temple of Science, James Ivory; and they lived together for some time. He never had any liking for the Church as a profession; and though he was formally entered at the Divinity Hall, he contrived to devote his first session to the sciences, particularly to Chemistry. In fact, he seems early to have relinquished all thoughts of the Church;—a resolution perhaps hastened by the death of his patron the Earl of Kinnoull, which took place soon after his removal to Edinburgh. He continued to study here till the close of the session of 1787; and, as is customary with students of greater ability and industry than means, devoted part of his time to private tuition. One of the young men whose studies he assisted was nearly related to, and became the heir of, Dr Adam Smith; a circumstance which he was accustomed to recollect with pleasure, as having made him known to that illustrious philosopher, who treated him kindly, and occasionally favoured him with directions as to his own pursuits. His first essay as an author must have been composed about the time of his leaving this university. It was a Paper *On the Resolution of indeterminate Problems*, which was read to the Royal Society of Edinburgh by Mr Playfair, in 1788, and published in their *Transactions*.[2]

In this year, he was prevailed upon by two young students of the name of Randolph, and of the distinguished American family of that name, to accompany them, in capacity of tutor, to Virginia; and he accordingly left Scotland alongst with them. They arrived at the place of their destination in the beginning of November; and his time afterwards seems to have passed both agreeably and usefully. He was all his life fond of visiting other countries, and perhaps a little disposed to underrate his own. Thus he was wont to say, that the thunder-storms of Virginia took away all feelings of awe at those of Scotland, just as the Alps of Switzerland left him nothing to admire in the Scottish mountains. His stay in the new world did not much exceed a year, owing to the breaking up of the family establishment by the death of the father of his young friends. After visiting New York and Philadelphia, he returned to his native place towards the close of the year 1789.

From some letters to his family, written about the time of his leaving America, his thoughts seem to have been anxiously directed to his future means of employment and support; and one of his schemes appears to have been to try his fortune in India, probably as a civil engineer. This notion recurred afterwards, but without leading to any results. His next field of adventure was London, whither he proceeded in January 1790, carrying with him various letters of recommendation; one of which was written by Dr

[1] "The great error," says he, "in modern education consists in the undue attention paid to the dead languages, which consumes the precious time that should be devoted, during the freshness of youth, to the higher intellectual pursuits." (See Preface to his *Rudiments of Geometry*, published in 1828.)

[2] See vol. ii. p. 193.

Adam Smith, then drawing near the close of his career. It was on this occasion, if our recollection does not mislead us, that Dr Smith exhorted his young friend never to approach any author whose favour he might wish to win, without first reading his book, lest the conversation should happen to turn that way. One of Mr Leslie's objects in visiting the capital, was to ascertain what success he might expect from a course of Lectures on Natural Philosophy; and the information he received soon satisfied him, as he says in a letter to one of his brothers, that "rational lectures would not succeed." He therefore employed himself for some time in writing for the *Monthly Review*, and in executing literary jobs delegated to him by his countryman Dr William Thomson, author of the continuation of Watson's *History of Philip the Third*, and of many other works now forgotten, and who was much in the habit of lending his versatile pen, as well as his name, to those who required the assistance or recommendation of either. But a more eligible and suitable connection was ere long opened to him, by the invitation of the younger Wedgewoods, who had been his fellow-students at Edinburgh, to reside with them, and superintend their studies. He readily acceded to their proposals; and proceeded, in April 1790, to their residence at Etruria, in Staffordshire, where he remained till the close of 1792, in the enjoyment of a liberal salary, and of society at once agreeable and intelligent. This was, in every sense, a happy and profitable period of his life. The time not devoted to tuition was assiduously employed in experimental investigations, and in completing a translation of Buffon's *Natural History of Birds*, which he had previously undertaken for a London bookseller. It was published in 1793, after he left Etruria, in nine volumes octavo. Though executed with fidelity and vigour, it was valued by himself, at least after he became otherwise eminent, only as having, by the sum which it procured him, laid the foundation of that pecuniary competency which he early foresaw to be necessary to the independent prosecution of his favourite studies; and which his industrious and prudent habits enabled him in no long time, in a moderate degree, to attain. The preface, however, speaks of this "first attempt" with some anxiety; and endeavours to bespeak favour for it as executed "at an early period of life, and in the retirement of the country." This preface is written in that nervous, but strained and ornate style, which characterises his after writings. His first contribution to Natural Philosophy, entitled *Observations on Electrical Theories*, was also written at Etruria; and was, in 1791, transmitted to the Royal Society of Edinburgh, for insertion in their *Transactions*. This was promised; but performance having, as he thought, been long and unhandsomely deferred, he indignantly recalled his Paper, and laid it aside for many years. It did not, indeed, see the light till 1824, when he was induced to publish it in the *Edinburgh Philosophical Journal*,[1] conducted by his distinguished friend Professor Jameson.

About the period of the close of his agreeable engagement at Etruria, which was occasioned, we believe, by the ill health of Mr Thomas Wedgewood, and the marriage of his younger brother, a Cornish gentleman with whom he had become acquainted at that place proposed to engage him as a companion in an extensive tour through Greece, Egypt, and the Holy Land. Ever fond, as he was, of visiting foreign countries, particularly those hallowed by memorable events or classical associations, the proposal could not but prove agreeable to him, and it was accordingly embraced with alacrity. The tour was to commence early in 1793; but a change of plan having been decided upon without his concurrence, and by which he found that his observations were to be transferred to another, he indignantly relinquished the engagement. His intention to visit these interesting countries, when a fit opportunity should occur, remained with him through life; and, at a period nearly forty years subsequent to this,—in his last years, indeed,—he actually made some preparations for a year's sojourn in Egypt and Palestine, from which he was diverted only by engagements and avocations of which he found it difficult to disencumber himself.

After leaving Etruria, he passed some months in Holland; a country which, like Descartes, he seems to have thought peculiarly suited to secluded study, and where he at this time acquired the German language. Thereafter, he returned to Largo, where he remained for about two years, devoted to experimental researches, in the course of which he invented and perfected his Differential Thermometer; the parent, if we may so speak, of that beautiful family of philosophical Instruments,[2] with which he enriched the Treasury of Science, and amplified and variegated the means of physical inquiry. His ingenuity had been early exercised in some attempts to construct an accurate Hygrometer, and these ultimately suggested to him the well-known contrivance above named;—a contrivance happily adapted to the measurement of the smallest variations of temperature, and which richly rewarded his inventive powers by its ministry to the achievement of his subsequent discoveries. It has generally, indeed, been allowed to be one of the most useful as well as elegant inventions that inductive genius ever applied to the investigation of chemical changes. At a later period, when his name had attained a high degree of celebrity, he, like most of the other sons of genius, was made to feel that fame brings with it pains as well as pleasures; for it was now discovered that the Differential Thermometer, instead of being an invention of his own, perfected, as he has himself recorded, in the course of a series of experiments on the evaporation of ice, which the severe winter of 1794–5 afforded him an opportunity of performing,[3] was in reality a plagiarism, if not from Van Helmont, who died in 1644, at any rate, from John Christopher Sturmius, who died some sixty years later. Such was one attempt to impeach the originality of this eminently inventive experimentalist. An Instrument of which all the world remained ignorant, till he, by means of it, told the world the better part of all it yet knows concerning the phenomena of radiated heat, was discovered to have been furtively purloined from one or other of these worthies! Neither the authors nor the abettors of this allegation pretended that either Van Helmont or Sturmius ever dreamt of such applications, or derived such results from their supposed invention, as were reserved, by some caprice of chance, no doubt! for its luckier plagiarist; and it is now, we believe, allowed, that this is just one of those cases of curious but partial anticipation so frequently to be met with in the history of science, and where the ultimate discoverer shows, by his skilful and fruitful employment of the disputed invention, how much he surpassed, and how little he needed the help of, those whom he is ungenerously supposed to have robbed of their legitimate honours.

---

[1] See vol. xi. p. 1.

[2] These Instruments, viz. the Differential Thermometer, Hygrometer, Hygroscope, Photometer, Pyroscope, Æthrioscope, and Atmometer, are all described, and their principles explained, by himself, in the articles CLIMATE and METEOROLOGY. The latter, like the former, will, at the proper place, be transferred, to this work, from the *Supplement* to the preceding editions. Properly speaking, the Hygrometer was the parent instrument; the Differential Thermometer having been invented in the course of his endeavours to improve it; but as the Hygrometer, in its latest form, is only a modification of the other, it may be represented as derived from it. See the article COLD.

[3] See the article METEOROLOGY.

In the spring of 1796, Mr Leslie received an invitation from his friend Mr Thomas Wedgewood, to accompany him in a tour through the north of Germany and Switzerland. To this proposal, which was every way agreeable, he immediately acceded. They arrived at Hamburg about the first of May, and employed that and the next four months in their tour, part of which was performed on foot. He alludes to their observations in the course of their journeyings amongst the mountains of Switzerland, in one of the notes to his work on Heat; but of this, as of all his subsequent tours on the Continent, he kept regular Journals, which are still preserved, and which show that he was no less observant of the social, moral, and economical condition of the countries he visited, than of their geological, meteorological, and physical aspects.

For some years after the period just mentioned, he seems to have employed himself in his experimental pursuits, and to have divided his time, chiefly, between London and Largo; to which place, and to the society of his family, he ever was fondly attached. His earnings by literary labour, and his allowances, had raised his humble fortune to what a philosopher might view as an independence; and he accordingly employed or amused himself as his own inclinations dictated. Early in the summer of 1799 he set out with an old college acquaintance on a tour to the northern kingdoms of Europe; in the capitals of which, the latter, who had for some time been settled in Spain as a merchant, had business to transact. After traversing Denmark, part of Norway, and Sweden, they proceeded through Brandenburg to Berlin; and from thence returned to England about the end of November. From his Journal of this tour, which is more detailed than any of those he subsequently kept, the Swedish mines appear to have formed particular objects of his attention. One of his entries records his having, before quitting Hamburg, written an account of his Hygrometer, for insertion in Voght's *Magazine*, and in the *Annales de Chimie*.

In the following year, he published the Paper just mentioned, but with some alterations, in Nicholson's *Philosophical Journal*. It is entitled a *Description of an Hygrometer and Photometer;* and was followed with *Additional Remarks* on these Instruments. In the same year, he also published, in that Journal, a Paper *On the Absorbent Powers of the Different Earths;* and other two, containing *Observations and Experiments on Light and Heat, with Remarks on the Inquiries of Dr Herschel on these objects.*[1] These small pieces are very valuable, as showing the progress of his researches and discoveries in that field of inquiry which their titles indicate.

The results of his more extended investigations were ere long to appear before the world in a different shape. Having collected at Largo all the necessary apparatus, he prosecuted with ardour a series of experiments, which enabled him, in the years 1801 and 1802, to compose the bulk of his celebrated work on Heat. In the latter year, "the gleam of peace," as he tells us in his usual ornate style, "tempted him to indulge in a temporary suspension; and to repair to the famed capital where the treasures of art and science are so profusely displayed. In that vortex of pleasure and centre of information, I spent," he adds, "several months very agreeably; but the work I had undertaken recalled my thoughts, and I hastened again to my retreat."[2] His *Experimental Inquiry into the Nature and Properties of Heat* was here at length completed. It was published at London in the spring of 1804, with a dedication, couched in terms of strong and affectionate friendship, to Mr Thomas Wedgewood, the companion of his studies at Etruria, and of his first continental tour. The early death of that ingenious and excellent person, whose delicate health is here feelingly alluded to, was always mentioned by him as a public as well as private misfortune. The originality and boldness of the peculiar doctrines of the *Inquiry*, and the number of new and important facts disclosed by its ingenious experimental combinations, conspired to render it an object of extraordinary interest in the scientific world; and, indeed, it must ever be viewed as constituting an era in the history of that branch of physical science which forms its subject. The Royal Society of London unanimously adjudged to its author the Rumford Medals appropriated as the reward of discoveries in that recondite province. As a philosophical disquisition, it is far, however, from being perfect. Its hypotheses are not warranted by the sober maxims of inductive logic; and its method and style are alike liable to serious criticism. But it would be difficult to name any work in the whole range of physical science more strongly indicative of a vigorous and inventive genius; and it must be allowed by all, that its beautifully devised experiments, and its large stock of new observations, far more than atone for its questionable theories, and for that desultory arrangement, and those ambitious modes of expression, which so often mar its reasonings and obscure its sense. More than ten years before the appearance of this work, Mr Leslie wrote an essay on *Heat and Climate*, which contains some of the theoretical opinions advanced in the former, as well as the germs of some of its discoveries. It was read at two successive meetings of the Royal Society of London in the spring of 1793; but it was not admitted into the *Transactions* of that body. Its aspiring author was not of a disposition to be checked in the career of inquiry by this repulse; and he did not shrink from bringing his Paper forth, in 1819, from its long oblivion of twenty-six years; he having then published it, for the first time, in Dr Thomson's *Annals of Philosophy*.[3]

Twice before that period of his life at which we are now arrived, Mr Leslie had appeared as a candidate for an Academical Chair; first in the University of St Andrews, afterwards in that of Glasgow, and on both occasions without success. He was again to try his fortune in the same line in the Metropolitan University. Early in the year 1805, a vacancy occurred in its Mathematical Chair, owing to the removal of Professor Playfair, on the death of Dr John Robison, to that of Natural Philosophy. This afforded a new opening to his academical ambition; and he was particularly desirous to occupy a Chair upon which the names of the Gregories, of Maclaurin, of Matthew Stewart, and of Playfair, had shed so much lustre. He accordingly presented himself as a candidate; and, with his now high reputation as a discoverer and original thinker, and his known eminence in mathematical science, it was not to be expected that he could have any formidable competition to surmount. Nor did there occur any, in as far as fame or talents were concerned. His principal competitor, though a man of amiable character, and respectable attainments, was wholly unknown in the scientific world, and as inferior to him in abilities as in renown. But he was one of the Ministers of the City, and supported with all the influence of that body; then pretty generally suspected of a wish to secure a monopoly of the

Philosophical Chairs of the University. It soon, however, became known that the Patrons were determined to decide upon a comparison of claims, and that Mr Leslie must triumph. In this state of things, and in an evil hour for themselves, the City Clergy were induced to raise an objection to his eligibility, on the serious ground of his having, in one of the notes appended to his work on Heat, approved of a doctrine directly leading to atheism. We are sorry to be obliged to notice this discreditable proceeding; but it forms too memorable an occurrence in Mr Leslie's life to allow us to pass it without some animadversion. In the note alluded to, the author, though no metaphysician, and in general rather a contemner of metaphysical science, was, naturally enough, led to illustrate what he had said in the text with reference to the unphilosophical opinion that impulse is necessary to the production of motion, by some remarks on *Causation*. He prefaces these by observing, that Mr Hume was the first who treated this subject "in a truly philosophical manner;" and that "the unsophisticated notions of mankind are in perfect unison with the deductions of logic, and imply nothing more at bottom, in the relation of cause and effect, than a constant and invariable sequence."[1] Founding upon these remarks, the Ministers of Edinburgh charged him with having "laid a foundation for rejecting all the argument that is derived from the works of God to prove either his Being or Attributes."[2] This heavy charge was preferred in a formal Protest, tendered by them to the Patrons of the University, in which they alleged that, in the election of Professors, the former were, by the charter of erection, bound to act *with the advice of the Ministers.* That advice was, in the present instance, given with sufficient emphasis; but the Patrons, much to their honour, treated it as it deserved; and Mr Leslie, to the great joy of all liberal minds, was, in March 1805, elected to the Mathematical Chair. The efforts of the disappointed junto did not, however, cease with this rebuff; nor did they desist from their ill-starred opposition, till a decision of the General Assembly of the National Church, pronounced on the 23d of May, after a memorable debate of two days,[3] satisfied them that persecution had now exhausted its resources, and that its hopes must, however sorrowfully, be relinquished. Dismissing any supposition of interested designs, and even allowing that Mr Leslie's expressed opinion as to *Causation*, if taken apart from the subject-matter of his book, or left unexplained, was calculated to occasion some alarm in the minds of the pious, still, impartial history ever must brand the proceedings of his opponents as alike uncharitable, unfair, and arrogant; and as deeply injurious to the character of that Church with whose name and authority they clothed themselves. It was on all hands admitted, that if Mr Leslie had, by a single word, limited his observations to *Physical* causes, they would have been wholly free from objection; and, surely, it required a most perverse and intolerant construction to extend to any but such causes, the observations of an illustrative note to a work purely physical, and undeniably levelled at those theories which resort to certain invisible *intermedia*, in order to account for the connection of physical sequences. But this was not all. Mr Leslie, on being informed of the charge, immediately declared, in a very pointed Letter laid before the junto, that his observations "*referred entirely* to the relation between cause and effect, considered as an object of *physical* examination."[4] Yet was this prompt explanation disingenuously disregarded—nay suppressed; whilst his persecutors—owing to an ignorant blunder in their statement of what they conceived to be the true notion of *Causation*—were themselves obliged to have recourse to explanation, in order to show that their doctrine was not identical with that of the Fatalists and Spinoza![5]

Mr Leslie commenced and prosecuted his official duties with great ardour. He entertained lofty ideas of the dignity and utility of the professorial character, and was thus disposed to make all the exertions necessary to success. Though the bent of his genius lay more to Physics than to Pure Mathematics, he had cultivated the study of Geometry with kindred relish; and with an admiration, in particular, of the analytical investigations of the ancient geometers, which led to his happiest essay in that science. As a teacher, he not only laboured to promote the study, but to procure for it a larger share of attention than our academical system usually assigns to it. His instructions were better suited, perhaps, to youths of superior ability than to ordinary students; but reputation and intellectual power produced their usual results, and secured for him an attendance as numerous as could be expected by any teacher, during the whole of the fifteen years that he occupied the Mathematical Chair. Soon after his election, he resolved to compose and to publish, at successive intervals, a complete "Course of Mathematics," digested and arranged according to his own ideas of what was wanted towards promoting a purer taste in the cultivation of the science. Of this Course, the first volume, comprising *Elements of Geometry, Geometrical Analysis, and Plane Trigonometry,* was published in 1809; and it has gone through several very extensive editions. The first part of it has been viewed as the least perfect and useful; but his own favourite portion, on *Geometrical Analysis*, has been extolled by the most unsparing critics of the former, as "a great acquisition to Elementary Geometry; and as calculated to keep alive the knowledge of a most beautiful and interesting branch of the mathematics, which has been too much overlooked during the improvement of the more general and powerful methods of algebraic investigation."[6] Abroad, it seems to have been viewed in a light equally favourable; as it was speedily translated into the French and German languages. He re-produced it, with considerable emendations, in the second volume of his "Mathematical Course," which, besides, contains the *Geometry of Curve Lines.* This volume was not published till 1821—an interval of twelve years having thus elapsed from the appearance of the first. A third volume, on *Descriptive Geometry, and the Theory of Solids,* was still wanting to complete his original design; but his removal to another Chair, and other circumstances, called his attention to different objects, and his "Mathematical Course" was thus left unfinished.

[4] See Professor Stewart's *Short Statement*, p. 36, and *Report of the Debate in the General Assembly*, p. 16.

[5] See *Short Statement*, p. 77-94, and *Report of the Debate, passim.* This remarkable controversy gave rise to a number of other publications; but none of them, with the exception of these two, an admirable *Letter* to the author of a Reply to the former, by Professor Playfair, and Dr Brown's *Observations on the nature and tendency of the doctrine of Mr Hume concerning cause and effect*, with other two pieces by that most acute metaphysician, have the least chance of interesting posterity The two pieces alluded to were, *A short criticism of the terms of the charge against Mr Leslie in the Statement of the Ministers of Edinburgh*, and *An examination of some remarks in Dr Inglis's Reply to Professor Playfair.* The Reply by Dr Inglis was the ablest production on the clerical side, and certainly evinced a good deal of controversial ability.

[6] *Edinburgh Review*, vol. xx. p. 98.

He was induced, at a late period of his life, to recast the first volume in a greatly abridged form. His object in doing so was to accommodate it to the use of those who, in riper years, become desirous to supply the defects of early education, and to qualify themselves for obtaining some knowledge of Natural Philosophy. This abridgment appeared in 1828, under the title of *Rudiments of Plane Geometry, including Geometrical Analysis, and Plane Trigonometry.* In connection with his mathematical works, though forming no part of his " Course," we may here mention the profound and learned treatise on the *Philosophy of Arithmetic*, which he published in 1817. It was a republication, with considerable alterations and additions, of one of the numerous articles contributed by him to the *Supplement* to the former editions of this Encyclopædia.

It was not to be expected that the labours of the Mathematical Chair would wean Professor Leslie from his experimental inquiries. His fine Instruments were always at hand, and always in use, in connection with some ingenious conception or other. Early in the summer of 1810, he determined to proceed with some experiments previously suggested in the course of his researches with his Hygrometer, but which had for some time been suspended; and they now conducted him to the discovery of that beautiful process of Artificial Congelation, by which he was enabled to produce ice, and even to freeze mercury, at pleasure. The discovery was achieved by means of a happily-conceived combination of the powers of rarefaction and absorption, effected by placing a very strong absorbent under the receiver of an air-pump. It was in the month of June of that season that the discovery was consummated.[1] We happened to witness this consummation,—at least the performance of the first successful repetition of his process,—and we never shall forget the joy and elation which beamed on the face of the discoverer, as, with his characteristic good nature, he patiently explained its principles, and the steps by which he had been led to it. We could not but feel, on looking at, and listening to him, how noble and elevating must be the satisfaction derived from thus acquiring a mastery over the powers of Nature, and enabling man, weak and finite as he is, to reproduce her wondrous works! Proportioned to the admiration which such achievements are calculated to excite, ought to be the disapprobation of any unfair endeavours to lower or depreciate them. We have already alluded to an attempt to divest this illustrious experimentalist of the honours connected with his Differential Thermometer; and we have now to add, that several years after the discovery of his process of Artificial Congelation, there were some similar endeavours to transfer the merit of it to a gentleman of the name of Nairne. The claim for him was founded on a Paper published in 1777, in the *Transactions* of the Royal Society of London; from which it appeared that he was acquainted with the facts, that evaporation produces cold, and that sulphuric acid, the absorbent employed by Mr Leslie, imbibes moisture. But in order to decorate Mr Nairne with the laurels of the latter, his depreciators ought to have been able to show, that the former had combined the properties alluded to, in a manageable process for the production of ice *ad libitum.* In such an attempt they must have failed ignominiously; and, perhaps, there is not in the whole history of science any more triumphant reply to a charge of plagiarism, than is furnished by the admitted facts, that with Mr Nairne's Paper before them for a long course of years, the scientific world remained utterly ignorant of the existence of any such process till the date of Mr Leslie's discovery; nay, that with his description of that process in their hands, the most distinguished experimentalists of the capital failed in their trials of it, till it was performed there by himself, in the ensuing summer![2]

In a letter from London to one of his friends, written in June 1811, he says, " My package has at last arrived, and I shall proceed without delay to make my *debut.*" It was only now that the experiment was first successfully performed in the capital. This took place before a meeting of some members of the Royal Society, and others. The discovery was announced in the same year, in the Memoirs of the French Institute; and the process itself was afterwards exhibited, in presence of that body, by M. Pictet and M. Gay-Lussac.[3] He did not himself publish any detailed account of his experiments and views on this interesting subject till 1813, when he explained them at considerable length, in a small volume entitled *A short Account of Experiments and Instruments depending on the Relations of Air to Heat and Moisture.* This publication, which was partly intended to promote the circulation of his Instruments, and to explain their principles, would have been infinitely more useful had its author superadded the powers of methodical and elementary exposition to his other endowments. But notwithstanding its defects in these particulars, it was much commended by those competent to appreciate its value as a contribution to science.[4] Closely connected with the subjects of this treatise, and which, therefore, we may notice here, though it did not appear till some years later, was an ingenious Paper, published in 1818, in the *Transac-*

---

[1] See the article Cold. The successive steps of the discovery are here recorded by himself, in those *verba ardentia* which the bent of his genius so strongly prompted him to employ.

[2] Some very complete and curious legal evidence of these facts was adduced by Professor Leslie, in 1822, in a prosecution which he was advised to institute against the publisher of a well-known *Magazine*, for a series of libels inserted in that work, and in one of which he was accused of having stolen the discovery alluded to, from Mr Nairne. Amongst other witnesses, two very distinguished Chemists were examined on that occasion—the late Dr Marcet, and Dr Thomson, Professor of Chemistry in the University of Glasgow. We shall extract a small portion of that of Dr Marcet, to whom Mr Leslie was, personally, but little known.—" *Q.* Is it your opinion that Mr Leslie is to be considered as having borrowed or stolen this discovery, or do you consider his discovery to be original?—*A.* Some of the facts were known long before, but the process itself is perfectly original.—*Q.* Is the discovery of Mr Leslie analogous to other discoveries in the science of chemistry?—*A.* There is hardly any discovery of the least value that has been made in that science but from the known properties of bodies. It is by combining those properties, so as to produce certain effects, that a discovery is made.—*Q.* Then, you mean to say that Mr Leslie has done what none before him ever accomplished?—*A.* Certainly. He has done what the whole philosophic world, with all the facts before them for a long period, had not been able to accomplish.—*Q.* When and by whom was the experiment first successfully performed in London?—*A.* It was successfully performed in London by Mr Leslie himself. My belief is, that no one succeeded in this experiment, in London, until Mr Leslie himself showed the way.—*Q.* Do you know that Sir Humphry Davy tried and failed?—*A.* I cannot positively say; I believe he tried it, but without success." (*Report of the Trial by Jury, Professor Leslie against William Blackwood*, p. 82-6.)

[3] See *Mémoires de la Classe des Sciences Mathématiques et Physiques*, t. xii. p. 80; t. xiv. p. 117-18.

[4] See *Edinburgh Review*, vol. xxiv. p. 339-52, and Dr Thomson's *Annals of Philosophy*, vol. ii. p. 457-62, for a skilful analysis of this treatise. In the Trial above alluded to, the party prosecuted took an *Issue* to show that the article in the *Edinburgh Review* in commendation of the work, was written by Mr Leslie himself. The attempt was not made; and it is hardly worth while to mention, with reference to such a charge, that the article was written by a very able chemist, the late Dr John Murray.

tions of the Royal Society of Edinburgh, under this title: *On certain impressions of cold transmitted from the higher atmosphere; with a description of an Instrument adapted to measure them.* The Æthrioscope, the instrument here alluded to, is, in another place, described, in the poetical language of its author, as "fitted to extend its sensation through indefinite space, and to reveal the condition of the remotest atmosphere."

In the autumn of 1814, Professor Leslie indulged himself with a tour of six weeks in France and the Netherlands. He never was satisfied if he allowed a vacation to pass without seeing or revisiting some foreign scenes. One or two extracts from Letters written by him on the present occasion, may be here introduced, as either curious in themselves, or characteristic of the writer. Writing from Paris, on the 1st of August, he says, "you know that it was not my intention at present to mix much with the *Sçavans.* But I have been so well received, and even feasted by them, that I may perhaps depart a little from my original design. Humboldt has been very kind and attentive to me, and introduces me wherever I want. They are much better acquainted with what we are doing than I should have imagined. My book on Heat is better known than in England. I was even reminded of some passages in it which in England were considered as fanciful, but which the recent discoveries on the Polarity of Light have confirmed. Even Laplace has, in consequence of some observations of mine, silently omitted a passage in the last edition of his *Système du Monde.* I paid a visit the other day at Arcueil. Berthollet has a fine chateau seated on a bank amidst gardens, vineyards, &c.; and Laplace has another, little inferior, and adjoining to the grounds. I dine with Laplace next Sunday. Some person had informed him that I was the author of a critique in the *Edinburgh Review* on a paper of his, and he had sent an answer to me, which, however, I never received."[1] The following extract from another letter, written at Bordeaux, in the beginning of September, gives a rapid and lively sketch of his journey to that place:—"My tour has furnished what I wanted—a number of images of the milder and hotter regions of the Continent. From Paris I proceeded to Macon, over a rich and well-cultivated country, covered with wheat and vineyards, the crop for the most part already gathered in. Thence I descended the Somme, a fine, clear river, to Lyons; the banks covered with luxuriant vineyards stretching to a range of hills, and the waved surface sprinkled with trees, intermixed with frequent villages, and lively villas, all of white limestone. At Lyons I met with the celebrated Baron Zach, and was conducted by him in his carriage to the fountain of Vaucluse, Avignon, and thence to Marseilles. His society was particularly entertaining and instructive. We now passed through the country of the mulberry, the fig, and the olive; but I confess that Provence did not come up to my expectation. I have seen, what I had longed to see, the awful fountain of Vaucluse, and the blue expanse of the Mediterranean; but the shores at Marseilles are terminated by gray, naked rocks, shooting fantastically to great heights. I staid some days at Marseilles, and spent most of my time at a country house occupied by the old Duchess of Saxe-Gotha, with whom Baron Zach lives in quality of Chamberlain. I found her very kind and affable, and extremely glad to hear any news of the Royal Family of England. From Marseilles I returned to Avignon, and then crossing the Rhine, proceeded to Nismes, over a country extremely fertile and interesting. This is almost a Roman town. There is a temple to Augustus, beautifully Corinthian, a fine temple of Diana, and an amphitheatre almost entire, capable of holding twenty thousand spectators. I now proceeded to Montpellier, and saw the majestic range of the Pyrenees stretching on our left, and covered with eternal snow. Montpellier is an interesting place,—its Botanic Garden rich, and its promenades superb. I then proceeded to Toulouse. In leaving it, the carriage plunged into a hollow across the road; it was eleven at night, but the moon shone full, and lighted up a fine rich plain. I shuddered when told that we had just crossed five hundred dead bodies, which had been thrust into a cut or trench of the road, after the late battle. The road to Bordeaux runs near the course of the Garonne, through one of the finest and richest countries I have ever seen." From this place he returned to Paris, and, after a short stay, proceeded through the Netherlands to Rotterdam, where he took shipping for Scotland.

The publication of the *Supplement* to the three editions of this Encyclopædia immediately preceding the present one, commenced towards the close of 1815, and was continued progressively till its completion early in 1824. To that work, which was undertaken upon an unusually extensive plan, and which aimed at procuring the highest attainable assistance, Mr Leslie was throughout a Contributor. His contributions, surprisingly numerous when his other avocations are considered, display all the powers and attainments for which he was remarkable. Nor was it by his writings alone that he aided this publication. His advice, his invaluable information,—amazing alike for its minuteness and extent,—and his influence, were always at the service of its Editor, whose acknowledgment of these various obligations has long been before the public.[2] But it is due to Mr Leslie's memory to specify in this sketch of his life what the work owes to his genius and knowledge. Ranged in alphabetical order, his writings in it occur under the following heads: Achromatic Glasses; Acoustics; Aeronautics; Andes; Angle; Angle, trisection of; Arithmetic, palpable and figurate; Atmometer; Barometer; Barometrical Measurements; Climate; Cold and Congelation; Dew; Interpolation; Meteorology.[3]

Another work which at intervals enjoyed the benefit of his co-operation, was the *Edinburgh Review.* But his contributions, though commencing in the year 1809, were not numerous. They helped, however, and that in an eminent degree, to strengthen and diversify the scientific department of that Journal; whilst those regarding Voyages and Travels combine scientific observation with powers of writing of no ordinary description. Among his principal articles may be mentioned those on the Physical and Chemical Memoirs of the Society of Arcueil; on the history of the Barometer; on Delambre's work on the Arithmetic of the Greeks; on Von Buch's Travels; on Humboldt's Physical View of the Equatorial Regions, and on his Travels; and on the attempts to discover a North-West Passage to Asia. The picture in the last, of the revolving year, as observed within the arctic circle, is executed with a force of conception, as well as of colouring, that have not often been surpassed.

---

[1] This must allude to a Paper by Laplace *On the Motion of Light in Diaphanous Media*, in the *Mémoires de la Societé d'Arcueil.* These Memoirs were reviewed by Professor Leslie, in two articles, in the fifteenth volume of the *Edinburgh Review*, published in 1810. They formed his first contributions to that Journal.

[2] See Preface to Supplement, p. 13.

[3] The present edition is enriched with the whole of these articles. That part of the article *Arithmetic*, which relates to palpable notation, has been omitted, with the exception of the curious disquisition on the *Abacus*, which is printed separately in this edition. The article *Interpolation* is, in it, annexed to that on Logarithms.

In the year 1819, a new field of professorial labour was opened to Mr Leslie, by the vacancy in the Chair of Natural Philosophy, occasioned by the death of one of the greatest ornaments of the University, Mr Playfair. Mr Leslie was on his return from one of his summer trips to the Continent when this lamented occurrence took place. The news met him on being put ashore at Largo, and is thus mentioned in a letter from that place, written on the first of August; in which he also describes an accident that had nearly, as he says, deprived the University of another Professor: "After having been detained for about a week in Holland, and after a tedious but agreeable passage of near ten days, I was at last put ashore here, from a sloop bound from Rotterdam to Grangemouth. Every thing looked joyous; but I had soon the tidings of poor Playfair's death, which was most unexpected and distressing. The loss to the university is severe.........I suspect that you were nearly deprived of two professors at once; for on Tuesday the 13th ultimo, I met with an alarming accident in Holland. I had passed the evening at a clergyman's with an intelligent merchant, late Provost of Aberdeen. On coming out of the house, at the end of the Boomtiges Street, or the street with rows of trees, the Maas running close, I stepped hastily forward to show him the Comet, and the quay being quite dark, I fell eight feet, and then plunged four feet in the water. This was the affair of an instant, and I felt that I was drowning; but I quickly recovered myself, and was helped out, with no damage but that of a bruise sustained in the fall." The eyes of the Patrons, and others interested in the University, were now turned to Mr Leslie, as the person best qualified to fill the vacant Chair. Two years before, when Mr Playfair was abroad, and an arrangement failed for carrying on the Class, Mr Leslie, at the very commencement of the session, unhesitatingly undertook the task for his absent colleague;[1] but, independently of this circumstance, his eminence in mathematical and physical science was such, that no one else could reasonably be thought of; and he accordingly was, without difficulty, appointed to the Chair; being thus a second time, but in more melancholy circumstances than on the former occasion, nominated a successor to his early friend.

The Chair to which he was thus unexpectedly called was unquestionably that for which he was best suited; and had he happened to be placed in it at the commencement of his professorial career, science in all probability would have derived greater benefits than she actually reaped from his powers. The time spent in his mathematical compositions would have been more profitably employed in that wider and richer province which he was so peculiarly qualified to cultivate. One of the first cares of his new situation was the extension of the Apparatus required for that greatly enlarged series of experiments which he thought necessary for the illustration of the Course. This, indeed, was an object of which, from the first to the last year of his incumbency, he never lost sight; and it is due to him to state, that it was through his exertions that the means of experimental illustration, in the Natural Philosophy Class, were for the first time made worthy of the place. Viewing him merely as a teacher, it must be admitted that he was not eminent. He was apt to forget, or rather did not perceive, that the connecting links between premises and conclusion, though familiar to the teacher, may, to the learner, be all unknown; that views quickly reached by the acquired perceptions of the one, must be opened up, step by step, to the yet imperfect vision of the other; and that it is the imperative duty of a public instructor to bring down knowledge from its highest spheres, and place it on a level adapted to the powers of unpractised understandings. His views of the nature of science were grand and animating; and his strictures on the great discoveries which constitute the epochs of its history, sometimes swelled into lofty strains of admiration; but, generally, in lecturing, as in writing, he wanted that consecution of thought, and that perspicuity of exposition, without which reasoning cannot be made intelligible, nor its conclusions satisfactory. Still, the attraction of his numerous experiments, the celebrity of his name, and the opinion entertained of his extraordinary powers, joined with great simplicity and affability of manner, concurred to secure him the respectful homage of his students, and to sustain the glory of the University. In 1823, he published, chiefly for the use of his class, a volume entitled *Elements of Natural Philosophy;* being the first of a Course intended to extend to three, and to exhibit a comprehensive view of the principles of that congeries of sciences which we are accustomed to class under the above term. Here, as was the case with his Mathematical Course, his plan was not completed; for he published no part of it but the volume mentioned, which includes only Mechanics and Hydrostatics. A second edition of this volume, corrected, and augmented with Notes, was published in 1829, three years before his death.

Mr Leslie had early determined to visit Italy at a fit opportunity; and he at last, in the summer of 1823, carried his design into execution. He set out with a mind still glowing with youthful enthusiasm, at the prospect of beholding the "eternal city;" but, whether from his entertaining too lofty conceptions, or from his view being too hurried and superficial, the tour, in as far at least as respected that crowning object of it, ended in disappointment. The following letter, written at Innsbruch on the 11th of August, contains a brief outline of his journey. "I have thus reached the frontiers of Germany on my return from Italy. I have fortunately achieved the principal objects of my tour; and though I have travelled slowly, I have seen a great deal in a short time. From Geneva I proceeded by Lausanne up the Valois to Brieg—thence crossed the Simplon, and descended through the plains of Lombardy to Milan. From this place I advanced by Parma and Modena to Bologna—next crossed the Appenines to Florence—again crossed another part of that broad chain to Rome. For various reasons, I made the 'eternal city' the limit of my journey. I therefore traversed the Appenines again to Ancona—skirted a considerable portion of the Adriatic—returned to Bologna, and thence proceeded to Mantua. I spent two days, about twenty miles from that place, at an old chateau, the residence of Acerbi, who accompanied me to Verona. Thence I went to Trent, and journeying through the Tyrol, have reached this spacious, interesting city. Italy has rather fallen below my expectations, whilst Switzerland has surpassed my early impressions. The passage of the Simplon alone is worth the journey; but the route through the Tyrol, though not so sublime, is highly picturesque. Italy has every thing on a grand scale. The plains, mountains, rivers, works of art, are all majestic and noble. But there is no comfort. Rome itself stands in the midst of a desert. Its grandeur has always been artificial—the result of force or fraud. I have seen whatever is most interesting; and I am inclined to differ very widely from our ordinary travellers. I heard much of the *malaria*, but I escaped untouched. I suffered little from the heat, and bore it better than the natives. Conformably to the custom, however, I was a sort of prisoner during a great part of the day—the windows shut to exclude every ray of light; and I was only called at times to look out, by the babbling chant of the Monks, with their torches and crosses, carrying the dead to their graves, and followed by the Charitable Brethren, like ghosts, apparelled in white sheets, with only holes for their eyes. They seemed better fitted to terrify the living than to comfort the dying." Two years after this, he made another tour on the Continent, in which he seems only to have gone over ground in France, the Netherlands, and Holland, which for the most part he had traversed before. This, we believe, was the last of his journeys abroad.

---

[1] Mr Playfair expressed his gratitude, in very warm terms, for the promptness with which Mr Leslie, on this occasion, relieved him from what would have otherwise proved an unpleasant predicament; and it is but justice to the latter to mention the act, as showing that the placability of his nature, aided perhaps by the consciousness of intellectual power, had entirely obliterated those feelings which the somewhat severe critique of his *Geometry* in the *Edinburgh Review*, known to have been written by Mr Playfair, would have left to rankle, and produce the ordinary results, in a mind more irritable or less magnanimous.

The only important production of Mr Leslie's latter years was that which formed his crowning benefaction to this work—his Discourse on the *Progress of Mathematical and Physical Science during the eighteenth century;* which, with others of a similar description, constitute its first volume. The opening tribute to Mr Playfair, of whose history of the earlier progress of these sciences, this Discourse is a continuation, does honour alike to the writer's candour and taste. "The progress of mathematical and physical science during the brilliant period which closed with Newton and Leibnitz, has," he says, "been traced with fidelity and sustained interest by the hand of a master, whose calm judgment weighed impartially the different claims of discovery, whose powers of illustration could expand the fine results, and whose luminous eloquence was commensurate with the dignity of the subject." Nor is his observation on his own task less just; namely, that the more crowded field of discovery which it presents rendered it one of increased difficulty;—"its multifarious materials often lying scattered among the countless volumes of the Transactions of learned Societies." His arrangement of these materials, and his view of the whole subject, is comprehensive, vigorous, and spirited; and the greater ease and perspicuity of its style make this the most agreeable of all his writings.

The volumes of the *Edinburgh Philosophical Journal*, published between 1824 and 1829, contain some small contributions, which may be here mentioned as also belonging to his latter years. The first consists of *Remarks on the Light of the Moon and of the Planets;* the second, of an *Enumeration of the Instruments requisite for Meteorological observations;* the third, of a *Letter on the Coniometer;* and the last, of *Observations on the Theory of Compression, applied to discover the internal constitution of our Earth.* The characteristic boldness and poetical dress of his speculations are abundantly displayed even in these small productions. In the first of them, he endeavours to show that the moon is a *phosphorescent* substance, like the Bolognian stone; and he anticipates a period when "she will no longer cheer our nights by her soft and silvery beams; when she will become dim and wane, and seem almost blotted from the blue vault of heaven. To our most distant posterity," he adds, "this prospect is indeed gloomy; but other changes will arise to renovate and embellish the spectacle of the universe." In the last, he carries his reasonings to the startling conclusion, that the crust of the planet on which we tread includes "an immense concavity, not dark and dreary, as poets have fabled, but containing *light* in its most concentrated state, shining with intense refulgence and overpowering splendour!"

Early in the year 1832, which unhappily proved to be that of his death, he was, on the recommendation, we believe, of Lord Brougham, then Lord High Chancellor, created a Knight of the Guelphic Order. This honour was also conferred on several other distinguished men of science, at the same time. In a letter mentioning this occurrence, he says, "my holiday title is now of course Sir John; but I shall always retain an affection for my old distinction of PROFESSOR." He had but few other titular distinctions of any sort; for he was far from setting any value on those arising from fellowship with Scientific Bodies. He was a member of the Royal Society of Edinburgh, but not of that of London. The only distinction of this kind that he in the least degree prized was his being elected a Corresponding Member of the Royal Institute of France. This took place, with honour, in 1820; the choice, if we recollect rightly, having fallen upon him, in preference to others then proposed, by a majority of thirty-three out of thirty-seven votes.

For a few years before the fatal one above mentioned, his occupations had been agreeably diversified, by his attention to the improvement of a small estate, called Coates, situate near his native place, of which he made a purchase. Here, the house and garden being every way commodious and suitable, and surrounded with scenes endeared by his earliest recollections, he loved to reside; and even those of his friends who most regretted that his precious time should be wasted on rural occupations, could not but sympathise with his feelings, and rejoice that the honourable labours of the Philosopher had enabled him to secure such a retreat. No one could enjoy more vigorous or constant health; and though of a corpulent habit of body, he was exceedingly active, and fond of exercise. His strength, and the longevity of his family—a circumstance on which he himself founded flattering hopes—alike gave promise of longer life; and it is melancholy to think that its close was but too probably hastened by one of his foibles—a contempt for medicine, and an unwillingness to think that he could be seriously ill. In the last days of October, whilst engaged in superintending some improvements on his grounds, he exposed himself to wet, and caught a severe cold. This was followed by erysipelas in one of his legs, which he neglected, and again imprudently exposed himself in the fields. He soon afterwards became dangerously ill, and expired at Coates, on the evening of Saturday the third of November 1832, in the sixty-seventh year of his age.

It has been well observed by Dr Johnson, that "of every great and eminent character, part breaks forth into public view, and part lies hid in domestic privacy. Those qualities which have been exerted in any known and lasting performances, may, at any distance of time, be traced and estimated; but those peculiarities which discriminate every man from all others, if they are not recorded by those whom personal knowledge enabled to observe them, are irrecoverably lost."[1] To prevent "this mutilation of character," as the same writer calls it, we shall close our narrative with a few details more particularly illustrative of the mind, opinions, and dispositions of this remarkable person. His discoveries, and the facts and controversies connected with them, may be discussed by many; and the full detail of them would require more space than can here be afforded; but, having enjoyed all the advantages for observation which long and intimate "personal knowledge" alone can supply, we think it right to endeavour, though briefly, to prevent some characteristic features from being "irrecoverably lost." The portrait may be imperfect; we cannot, indeed, complete it to our own satisfaction on our narrow canvass; but, in as far as the sketch extends, we can honestly say that it is faithfully copied from nature.[1]

---

[1] Johnson's *Life of Sir Thomas Browne.*

It would be impossible, we think, for any intelligent and well-constituted mind, thoroughly acquainted with the powers and attainments of Sir John Leslie, to view them without a strong feeling of admiration for his vigorous and inventive genius, and of respect for that extensive and varied knowledge, which his active curiosity, his excursive reading, and his happy memory, had enabled him to amass and digest. Some few of his contemporaries in the same walks of science may have excelled him in profundity of understanding, in philosophical caution, and in logical accuracy; but we doubt if any surpassed him, whilst he must be allowed to have surpassed most, in that creative faculty —one of the highest and rarest of nature's gifts—which leads to and is necessary for discovery, though not all-sufficient of itself for the formation of safe conclusions; or in that subtilty and reach of discernment which seizes the finest and least obvious qualities and relations of things—which elicits the hidden secrets of nature, and ministers to new and unexpected combinations of her powers. "Discoveries in science," says he, in one of his works, "are sometimes invidiously referred to mere fortuitous incidents. But the mixture of chance in this pursuit should not detract from the real merit of the invention. Such occurrences would pass unheeded by the bulk of men; and it is the eye of genius alone that can seize every casual glimpse, and discern the chain of consequences." With genius of this sort he was richly gifted. Results overlooked by others were by him perceived with a quickness approaching to intuition. To use a poetical expression of his own, they seemed "to blaze on his fancy." He possessed the inventive in a far higher degree of perfection than the judging and reasoning powers; and it thus sometimes happened, that his views and opinions were not only at variance with those of the majority of the learned, but inconsistent with one another. Notwithstanding the contrary testimony, explicitly recorded, of the founders of the English Experimental School, he denied all merit and influence to the labours of the immortal delineator of the Inductive Logic. He freely derided the supposed utility of Metaphysical Science, without perceiving that his own observations on *Causation* virtually contained the important admission, that physical is indebted to mental philosophy for the correct indication of its legitimate ends and boundaries. His writings are replete with bold and imaginative suppositions; yet he laments the "ascendancy which the passion for hypotheses has obtained in the world."[2] His credulity in matters of ordinary life was, to say the least of it, as conspicuous as his tendency to scepticism in science. It has been profoundly remarked by Mr Dugald Stewart, that "though the mathematician may be prevented, in his own pursuits, from going far astray, by the absurdities to which his errors lead him, he is seldom apt to be revolted by absurd conclusions in other matters." "Thus, even in physics," he adds, "mathematicians have been led to acquiesce in conclusions which appear ludicrous to men of different habits." Something of this sort was observable in the mind of this distinguished mathematician. He was apt, too, to indulge in unwarrantable applications of mathematical reasoning to subjects altogether foreign to the science; as when he finds an analogy between circulating decimals and the lengthened cycles of the seasons! But when the worst has been said, it must be allowed that genius has struck its captivating impress over all his works. Whether his bold speculations lead him to figure the earth as enclosing a stupendous concavity filled with light of overpowering splendour; or to predict the moon's arrival at an age when her "silvery beams" will become extinct; or to ascribe the phenomena of radiated heat to aërial pulsations; we at least perceive the workings of a decidedly original mind. This, however, is not all. His theoretical notions may be thrown aside or condemned; but his exquisite instruments, and his experimental combinations, will ever attest the utility no less than the originality of his labours, and continue to act as helps to farther discovery. We have already alluded to the extent and excursiveness of his reading. It is rare, indeed, to find a man of so much invention, and who himself valued the inventive above all the other powers, possessing so vast a store of information. Nor was it in the field of science alone that its amplitude was conspicuous. It was so in regard to every subject that books have touched upon. In Scottish history, in particular, his knowledge was alike extensive and accurate; and he had, in acquiring it, gone deep into sources of information—such as parish records, family papers, and criminal trials—which ordinary scholars never think of exploring. The ingenious mathematician, the original thinker, the rich depositary of every known fact in the progress of science, would have appeared to any one ignorant of his name and character, and who happened to hear him talk on this subject, as a plodding antiquary; or, at best, as a curious and indefatigable reader of history, whom nature had blessed with at least one strong faculty, that of memory. His conversation showed none of that straining after "thoughts that breathe, and words that burn," so conspicuous in his writings. In point of expression, it was simple, unaffected, and correct. Though he did not shine in mixed society, and was latterly unfitted, by a considerable degree of deafness, for enjoying it, his conversation, when seated with one or two, was highly entertaining. It had no wit, little repartee, and no fine turns of any kind; but it had a strongly original and racy cast, and was replete with striking remarks and curious information.

Viewing the whole of his character, moral and intellectual, it must be confessed that it presented some blemishes and defects. He had prejudices, of which it would have been better to be rid; he was not over charitable in his views of human virtue; he was not so ready, on all occasions, to do justice to kindred merit as was to be expected in so ardent a worshipper of genius; and his care of his fortune went much beyond what is seemly in a philosopher. But his faults were far more than compensated by his many good qualities;—by his constant equanimity, his cheerfulness, his simplicity of character almost infantile, his straightforwardness, his perfect freedom from affectation, and, above all, his unconquerable good nature. He was, indeed, one of the most placable of human beings; and, notwithstanding his general attention to his own interest, it is yet undeniable, that he was a warm and good friend, and a relation on whose affectionate assistance a firm reliance ever could be placed. He was fond of society, and greatly preferred and prized that of the intelligent and refined; but no man ever was more easily pleased; no fastidiousness ever interfered with his enjoyment of the passing hour; he could be happy, and never failed to converse in his usual way, though in the humblest company; and we have often known him pass an afternoon with mere boys, discoursing to them pleasantly upon all topics that presented themselves, just as if they had been his equals in age and attainments. He was thus greatly liked by many who knew nothing of his learning or science, except that he was famous for both.

---

[1] The substance of some of the following observations appeared in the Newspapers immediately after the death of Sir John Leslie. They may, without impropriety, be used here, by the pen from which they originally proceeded.

[2] See Introduction *to Elements of Natural Philosophy*.

He was never married. As to his person,—he was somewhat under the middle size, and corpulent, but strong and well limbed; and though his face was large and florid, there was that about his eyes and forehead which seemed to show that he was no ordinary man. There is a Bust of him by Joseph; a Portrait of the ordinary size, taken a few years before his death, by Wilkie; and a Head, drawn at an earlier period, by Henning, which presents a striking likeness.

LESNAIA Reka, a river of Asiatic Russia, which flows through the government of Tobolsk, in Russia. Its course is towards the north, and it flows into the Frozen Ocean.

LESPARRE, an arrondissement of the department of the Gironde, in France, 742 square miles in extent. It contains four cantons, which are divided into thirty-seven communes, and it is peopled by 32,500 inhabitants. The capital is a town of the same name, situated on a swampy spot, whence a brook runs to the Gironde. It has 200 houses, and 1050 inhabitants.

LESSER Tone, in *Music*. See Tone.

LESSINA, a large island in the Adriatic Sea, being a part of the Austrian province of Dalmatia. It extends over 396 square miles, and contains one city, three market-towns, and thirty villages, with 8819 inhabitants. Although the surface is both woody and mountainous, it has some beautiful and productive valleys, yielding in abundance wine, olives, figs, and almonds, and an adequate supply of corn. Much of the wine is exported. The Sardinia fishery is a profitable branch of industry. The capital is a town of the same name, containing a castle, a cathedral, and 1237 inhabitants.

LESSINES, a city of the Netherlands, in the province of Hennegau, and arrondissement of Tournay, situated on the left bank of the Dender. It contains 3800 inhabitants, and has several breweries, distilleries, tanneries, and oil-mills. Long. 3. 43. E. Lat. 51. 41. N.

LESSOE, an island belonging to the Danish province of Aaland. It is situated in the Cattegat, and contains, in three parishes, 1570 inhabitants, who subsist partly by fisheries and by pilotage. Long. 10. 45. E. Lat. 57. 23. N.

LESSONS, amongst ecclesiastical writers, portions of the Holy Scripture, which were read in Christian churches at the time of divine service.

In the ancient church, reading the Scriptures was one part of the service of the catechumens, at which all persons were allowed to be present, in order to obtain instruction.

L'ESTRANGE, Sir Roger, a well-known writer of the seventeenth century, was descended from an ancient family of Hunstanton Hall, in the county of Norfolk, where he was born in 1616, being the youngest son of Sir Hammond l'Estrange, a zealous royalist. Having in 1644 obtained a commission from Charles I. for reducing Lynn in Norfolk, then in possession of the parliament, his design was discovered, and his person seized. He was tried by a court-martial at Guildhall in London, and condemned to death as a spy; but he was subsequently reprieved, and continued in Newgate for some time. He afterwards went beyond sea; but in August 1653 returned to England, where he applied himself to the protector, Cromwell, and having once played before him on the bass-viol, he was by some nicknamed "Oliver's fiddler." Being a man of parts, master of an easy, humorous style, and withal in narrow circumstances, he established a newspaper, under the title of *The Public Intelligencer*, in 1663; but upon the publication of the first London Gazette in 1665, he discontinued it, having been allowed a compensation by government. Some time after the Popish plot, when the Tories began to gain the ascendency over the Whigs, he, in a paper called the *Observator*, became a zealous champion of the former. He was afterwards knighted, and served in the parliament called by James II. in 1685. But things taking a different turn in that prince's reign, in point of liberty of conscience, from what most people had expected, his *Observators* were discontinued, as not being at all suited to the times. However, he continued licenser of the press until the accession of King William III., in whose reign he met with some trouble, from being considered a disaffected person. However, he went down to his grave in peace, after he had in a manner survived his intellects. He published a great many political tracts, and translated from the Greek, Latin, and Spanish, the works of Josephus, Cicero's Offices, Seneca's Morals, Erasmus's Colloquies, Æsop's Fables, and Bonas's Guide to Eternity. The character of his style has been variously represented; his language being considered by some as easy and humorous, whilst others conceive that his productions are not fit to be read by any who have pretensions to taste or good breeding.

LETCHLADE, a market-town in the hundred of Brightwells Barron, in Gloucestershire, seventy-six miles from London. It has some trade, from standing on the canal which joins the Thames with the Severn. There is a market on Tuesday. The population amounted in 1801 to 917, in 1811 to 993, in 1821 to 1154, and in 1831 to 1244.

LETHARGY, in *Medicine* (from ληθη, *oblivion*, and ἀργια, *numbness, laziness*), a disease consisting of a profound drowsiness or sleepiness, from which the patient can scarcely be awaked; or, if awaked, he remains stupid, without sense or memory, and presently sinks again into his former sleep.

LETHE (from λανθανω, *to hide* or *conceal*), in the ancient mythology, one of the rivers of hell, signifying oblivion or forgetfulness; its waters, according to poetic fiction, having the peculiar quality of making those who drank them forget everything that was past.

LETI, Gregorio, an eminent Italian writer, was descended of a family which once made a considerable figure at Bologna. Jerom, his father, was page to Prince Charles de' Medicis; served some time in the troops of the grand duke as captain of foot; and married at Milan, where he settled in 1628. He was afterwards governor of Almantea in Calabria, and died at Salerno in the year 1639. Gregorio was born at Milan in 1630, studied under the Jesuits at Cosenza, and was afterwards sent to Rome by an uncle, who wished him to enter the church; but he being averse to this, proceeded to Geneva, where he studied the principles of religion and government. Thence he went to Lausanne; and having contracted an acquaintance with John Anthony Guérin, an eminent physician, lodged at his house, made profession of the Calvinist religion, and married his daughter. He settled at Geneva, where he spent nearly twenty years, carrying on a correspondence with learned men, especially with those of Italy. Some contests obliged him to leave that city in 1679; upon which he went to France, and then to England, where he was received with great civility by Charles II. who, after his first audience, made him a present of a thousand crowns, and promised him the place of historiographer. Whilst in England, he wrote a history of that country; but as this work displeased the court, on account of his too great liberty in writing, he was ordered to leave the kingdom. He went to Amsterdam in 1682, and was honoured with the place of historiographer to that city. Leti died suddenly in 1701. He was a man of indefatigable application, as is evinced by the multiplicity of his works. The principal of these are, 1. The Universal Monarchy of Louis XIV.; 2. The Life of Pope Sixtus V.; 3. The Life of Philip II. King of Spain; 4. The Life of the Emperor Charles V.; 5. The Life of Elizabeth, Queen of England; 6. The History of Oliver Cromwell; 7. The History of Great Britain, in five vols. 12mo; 8. The History of Geneva; besides other works.

LETRIM, a county of Ireland. See LEITRIM.

LETTER, a character used to express one of the simple sounds of the voice. As the different simple sounds are expressed by different letters, these, by being differently compounded, become the visible signs or characters of all the modulations and varieties of sound used to express our ideas in a regular language. Thus, by the help of speech we render our ideas audible; by the assistance of letters we render them visible; and by means of these we can wrap up our thoughts, and send them to the most distant parts of the earth, or read the transactions of different ages. What letters were originally, who first invented them, and amongst what people they were primarily used, there is still reason to doubt. Philo attributes this great and noble invention to Abraham; Josephus, St Irenæus, and others, to Enoch; Bibliander, to Adam; Eusebius, Clemens Alexandrinus, Cornelius Agrippa, and others, to Moses; Pomponius Mela, Herodian, Rufus Festus, Pliny, Lucan, and others, to the Phœnicians; St Cyprian, to Saturn; Plato and Tacitus, to the Egyptians; some, to the Ethiopians; and others, to the Chinese, who cannot possibly be entitled to this honour, since all their characters are the signs of simple ideas, and have nothing in common with letters.

There have also been various conjectures respecting the different kinds of letters used in different languages. Thus, according to Crinitus, Moses invented the Hebrew letters; Abraham the Syriac and Chaldaic; the Phœnicians those of Attica, brought into Greece by Cadmus, and thence carried into Italy by the Pelasgians; Nicostrata, the Roman; Isis, the Egyptian; and Vulfilas, those of the Goths. These, however, are but fanciful conjectures, which it is sufficient to state, and would be vain to examine or discuss.

The natural order of invention, in the visible representation of thought, seems to be indicated, not merely by theory, but by facts ascertained from the analysis of ancient graphic remains, as well as by the practice actually followed amongst several existing nations. The primary and elemental form was unquestionably that of picture-writing, or the delineation, more or less rude, of external objects, as these present themselves to the eye; with perhaps some marks expressive of *day*, *week*, *month*, *year*, and even of *time* generally. The next was the hieroglyphic or ideagraphic form, which consisted not only of pictures or resemblances of external objects, but also, and in a much larger proportion, of images metaphorically or analogically transferred, so as to become signs of other things, and to indicate general notions as well as simple ideas. This was no doubt a very great improvement on picture-writing, inasmuch as it gave considerable extension and variety to the power of expression, and enabled mankind, though in a laborious form, to write their annals, inscribe their monuments, and preserve what knowledge they had acquired. The third and the last step in the gradual improvement of writing, was the invention of letters; that is, of signs or marks expressive, not of ideas whether simple or complex, but of the elementary sounds of the human voice. This was the ultimate term, the final generalization, which led to the greatest and happiest of all discoveries, that of a literal alphabet.

It is no doubt true that some nations appear to have stopped short before reaching this final term, and to have remained satisfied with a more elaborate and imperfect mode of graphic representation. The Mexicans, for instance, had not advanced beyond picture-writing, in its rudest and simplest form. The Chinese have, for ages, employed a multitude of ideagraphic characters, derived, by composition and otherwise, from a limited number of elementary pictures or representations of external objects, without making the least step towards an alphabet, on the very verge of which invention they stand as often as they employ their ideagraphic characters, phonetically, to express the sounds of a foreign proper name. The ancient Egyptians also remained contented with their hieroglyphical system; and although Plato attributes to their god Thoth the invention of letters, the honour of that discovery appears rather to have belonged to other nations, who were not trammelled by habit, or restrained by prejudice, from attempting to improve their method of written expression. But it does not follow from this, as some have pretended, that letters are not derivable from ideagraphic signs, because some nations had not the ingenuity to make the derivation. It might with as much reason be maintained, that the law of universal gravitation is not deduceable from the fact of the descent of heavy bodies in a line directed towards the centre of the earth, because the deduction was not fully made, and clearly established, until the time of Newton. The Egyptians, like the Chinese, as often as they had occasion to write a foreign proper name, employed their ideagraphic characters phonetically, that is, as alphabetical letters expressive of *sounds* merely; in other words, the very exigencies of their graphic system forced upon them the knowledge and the practice of an alphabet, to the extent here indicated. They were, therefore, upon the very threshold of the discovery; necessity itself had impelled them in the right direction; the slightest attempt at generalization would have led them to the grand consummation; and, if they had tried to do that, generally, which they found themselves obliged to do in particular cases, the result would have been the displacement of ideagraphic by alphabetic characters. But does it follow, because they failed to make this final step, that the invention of letters was not the natural result of that state of things which immediately preceded it; or that alphabetic writing is not an invention of man, but "a miraculous gift to him from God," as Dr Wall of Dublin and some others contend?

This seems to be not only unphilosophical in an eminent degree, but likewise absurd and preposterous. For if it required a miracle to deduce letters from hieroglyphics, it must have equally required one to deduce hieroglyphics, in all their complex variety of tropical, kuriological, and anaglyphic, from mere imitative representations, such as were found in use amongst the Mexicans when the Spaniards first landed in the New World. The distance between the Mexican and the Egyptian systems is fully as great as, if not greater than, the distance between phonetic hieroglyphics and the alphabet of Cadmus. If we were always to presume the interposition of miraculous agency in cases where men failed to reach inventions or discoveries, upon the very borders of which they had been standing for ages, history would become a romance, and philosophy a manual of superstition. The order of nature is not thus dislocated and disturbed; nor does the ordinary progress of invention, improvement, and generalization require to be accounted for or explained by supposititious assumptions of supernatural interposition. The miracle connected with the invention of an alphabet is its extreme simplicity, united with the almost unlimited power which it gives to man of expressing his thoughts in writing.

Letters constitute the first or elementary part of grammar; and they are combined, first, into syllables, secondly, into words, and, thirdly, into sentences. The alphabet of every language consists of a certain number of letters, which ought to have each a different sound, figure, and use. As the difference of articulate sounds was intended to express the different ideas of the mind, so one letter was originally intended to signify only one sound, and not, as at present, to express sometimes one sound, and sometimes another; a practice which has brought a great deal of confusion into languages, and rendered the acquisition of the modern tongues much more difficult than it would otherwise have been. This consideration, together with the defects of all the known alphabets, from their wanting certain letters to express certain sounds, has occasioned several attempts to form an universal alphabet, containing an enumeration of all the single sounds or letters which are used in any language.

Grammarians distinguish letters into vowels, consonants, mutes, liquids, diphthongs, and characteristics. They receive their denomination from the shape and turn which is given to them; and in writing are distinguished into different hands, as round text, German text, round hand, Italian, and so forth; and in printing, into Roman, Italic, and black letter.

The term Letter, or *Type*, amongst printers, not only includes the capitals, small capitals, and small letters, but all the points, figures, and other marks cast and used in printing; and also the large ornamental letters cut in wood or metal, which are employed instead of the illuminated letters used in manuscripts. The letters used in printing are cast at the ends of small pieces of metal, about three quarters of an inch in length; and the letter being not indented, but raised, easily gives the impression, when, after being blacked with a glutinous ink, paper is closely pressed upon it. (See the article Printing.) A fount of letters includes small letters, capitals, small capitals, points, figures, spaces, and other necessary adjuncts. See Fount.

Letter is a writing directed and sent by one person to another. See Epistle.

The art of epistolary writing was considered by the Romans amongst the number of polite and liberal accomplishments; and we find Cicero mentioning, with great pleasure, in some of his letters to Atticus, the elegant specimen he had received from his son of his genius in this way. It seems indeed to have formed part of their education; and, in the opinion of Mr Locke, it well deserves to have a share in ours. The writing of letters enters so much into all the occasions of life, that no gentleman can avoid showing himself in compositions of this kind. Occurrences will daily force him to make this use of his pen, which lays open his breeding, and sense, and his abilities, to a severer examination than any oral discourse.

Purity in the choice of words, and justness of construction, joined with perspicuity, are the leading properties of the epistolary style. Accordingly, Cicero says, "In writing letters, we make use of common words and expressions;" and Seneca observes, "I would have my letters to be like my discourses, when we either sit or walk together, unstudied and easy." For what prudent man, in his common discourse, aims at bright and strong figures, beautiful turns of language, or laboured periods? Nor is it always requisite to attend to exact order and method. He who is master of what he writes, will naturally enough express his thoughts without perplexity and confusion; and anything more than this is seldom necessary, especially in familiar letters.

As the subjects of epistles are exceedingly various, they necessarily require corresponding variety in the manner of expression. If the subject be something weighty and momentous, the language should be strong and solemn; in things of an inferior description, free, easy, and familiar; and upon lighter matters, jocose and pleasant. In exhortations, it ought to be lively and vigorous; in consolations, kind and compassionate; in admonition, grave and serious. In narratives, it should be clear and distinct; in requests, modest; in commendations, friendly; in prosperity, cheerful; in adversity, mournful, but not mean or desponding. In a word, the style ought to be accommodated to the particular nature of the subject concerning which it is the object of the writer to express his sentiments and feelings.

Letter of Attorney, in *Law*, is a writing by which one person authorizes another to do some lawful act in his stead.

Letter of Marque. See Marque.

Letters Patent or *Overt*, are writings sealed with the great seal of England, by which a man is authorized to do or to enjoy any thing exclusively for a period of time, which, of himself, he could not do without such authority. They are so called by reason of their form, as being open, with the seal affixed, ready to be shown for the confirmation of the authority given by them.

LETTITSCHEW, a circle of the province Podolia, in Russia. It extends in north latitude from 49. 6. to 49. 37. and in east longitude from 25. 9. to 27. 52. It is well watered by the Bug and the Wotschik, and has many extensive forests, with some fertile soil. The capital, a city of the same name, is 950 miles from Petersburg; it is situated on the Wotschik, and has one Catholic and two Greek churches, 380 houses, and 1860 inhabitants. Long. 27. 39. E. Lat. 40. 22. 30. N.

LEUCA, in *Antiquity*, a geographical measure of length, in use amongst the later Gauls, and which, according to Jornandes, who calls it *leuga*, contained fifteen hundred paces, or one mile and a half. Hence the name of *league*, in the lower age called *leuva*, and now reckoned at about three miles.

LEUCATA, or Leucate, in *Ancient Geography*, a promontory of Leucadia, being a white rock projecting into the sea towards Cephalonia, on which stood a temple of Apollo surnamed *Leucadius*. At the festival which was annually celebrated here, the people were accustomed to offer an expiatory sacrifice to the god, to avert all the calamities with which they might be threatened. For this purpose they made choice of a criminal condemned to death, whom, having conducted to the brink of the promontory, they precipitated into the sea amidst the loud shouts of the spectators. The criminal, however, seldom perished in the water; for it was the custom to cover him with feathers, and to fasten birds to his body, which by spreading their wings served to break his fall. No sooner did he touch the sea, than a number of boats stationed for the purpose flew to his assistance, and drew him out; but after being thus saved, he was banished for ever from the territory of Leucadia.

According to ancient authors, a strange opinion concerning this promontory prevailed for some time amongst the Greeks. They imagined that the leap of Leucate was a potent remedy against the violence of love. Hence disappointed or despairing lovers, it is said, were often known to go to Leucadia, and, having ascended the promontory, and offered sacrifices in the temple, and engaged by a formal vow to perform the desperate act, to precipitate themselves into the sea. Some are reported to have recovered from the effects of the fall; and, amongst these, mention is made of a citizen of Buthroton, in Epirus (Butrinto, in Albania), whose passions always taking fire at new objects, had four times recourse to the same remedy, and always with success. As those who made the trial, however, seldom took any precaution to render their fall less rapid, they were generally destroyed; and women often fell victims to this act of superstitious desperation. At

Leucate was shown the tomb of Artemisia, the celebrated queen of Caria, who gave so many proofs of courage at the battle of Salamis. Inflamed with a violent passion for a young man who inflexibly refused her love, she surprised him in his sleep, and put out his eyes. But regret and despair soon drove her to Leucate, where she perished in the waves, notwithstanding that every effort was made to save her. Such likewise was the end of the unhappy Sappho. Forsaken by her lover Phaon, she went thither to seek relief from her sufferings, and found it in destruction.

LEUCIPPUS, a celebrated Greek philosopher, respecting the exact period of whose birth and death we are ignorant. Neither is his birth-place known; but Diogenes Laertius, who furnishes us with a few facts respecting him, states that he was a native either of Velia in Italy, Abdera, or Miletus. According to Jamblichus, he had in his youth attended Pythagoras; he was the disciple of Melissus, and of Zeno of Velia, which confirms the supposition that he must have flourished about B. C. 430. He was the first who invented the system of atoms, which was afterwards more fully explained by Democritus and Epicurus. Posidonius (Strab. xvi. 512) ascribed the honour of this invention to Moschus, a Phœnician philosopher, who lived, it is said, before the siege of Troy; but there seems little reason to believe that this statement is correct. Several other philosophers had, before the time of Leucippus, considered matter as divisible into indefinitely small particles; but Leucippus and Democritus were the first who taught that these particles were originally destitute of all qualities except figure and motion. According to this theory, the universe, which is infinite, is in part a *plenum* and in part a *vacuum*. The *plenum* contained innumerable corpuscles or atoms of various figures, which, falling into the *vacuum*, struck against each other; and hence arose a variety of curvilinear motions, which continued, till at length atoms of similar forms met together, and bodies were produced. The primary atoms being specifically of equal weight, and not being able, on account of their multitude, to move in circles, the smaller rose to the exterior parts of the vacuum, whilst the larger, entangling themselves, formed a spherical shell, which revolved about its centre, and which included within itself all kinds of bodies. The central mass was gradually increased by a perpetual accession of particles from the surrounding shell, till at last the earth was formed. Lactantius has ably refuted the hypothesis of Leucippus (*Instit. Divin.* iii. 17.) (See a Memoir of Batteux on the Active Principle of the Universe, *Mém. de l'Acad. des Inscrip.* xxix.; also Montucla, *Hist. des Math.* i. 147; and Bayle, *Dictionaire.*)

LEUCOMA, in *Antiquity*, was a public register amongst the Athenians, in which were inserted the names of all the citizens as soon as they were of age to enter upon their paternal inheritance.

LEUCOPETRIANS, in *Ecclesiastical History*, the name of a fanatical sect which sprang up in the Greek and eastern churches towards the close of the twelfth century. The fanatics of this denomination professed to believe in a double trinity; rejected wedlock; abstained from flesh; treated with the utmost contempt the sacraments of baptism and the Lord's supper, with all the various branches of external worship; placed the essence of religion in internal prayer alone; and maintained that an evil being or genius dwelt in the breast of every mortal, and could be expelled thence by no other method than by perpetual supplication to the Supreme Being. The founder of this sect of enthusiasts is said to have been a person called Leucopetrus, and his chief disciple Tychicus, who corrupted, by fanatical interpretations, several books of Scripture, particularly St Matthew's Gospel.

Leucothoe
‖
Leuwenhoeck.

LEUCOTHOE, or LEUCOTHEA, in fabulous history, the wife of Athamas, who was changed into a sea deity. She was the Matuta of the Romans, and had a temple at Rome, where all the people, particularly women, offered vows for their brothers' children. They did not entreat the deity to protect their own children, because Ino had been unfortunate in hers. No female slaves were permitted to enter the temple; or if curiosity tempted them to transgress this rule, they were beaten with the greatest severity.

LEUCTRA, in *Ancient Geography*, a town of Bœotia, to the west of Thebes, situated between Platæa and Thespia, where the Lacedæmonians sustained a terrible defeat by the Thebans under Epaminondas and Pelopidas. See SPARTA.

LEUSDEN, JOHN, a celebrated philologist, born in 1624. He studied the learned languages and mathematics at Utrecht, and then went to Amsterdam to converse with the rabbin, and perfect himself in the Hebrew tongue; after which he became professor of Hebrew at Utrecht, where he acquired a great reputation, and died in the year 1699. He wrote many valuable works, the principal of which are, 1. Onomasticum Sacrum, 8vo; 2. Clavis Hebraica et Philologica Veteris Testamenti, 4to; 3. Novi Testamenti Clavis Græca, cum Annotationibus Philologicis, 8vo; 4. Compendium Biblicum Veteris Testamenti, 8vo; 5. Compendium Græcum Novi Testamenti, the best edition of which is that of London, in 1668, 12mo; 6. Philologus Hebræus, 4to; 7. Philologus Hebræo-mixtus, 4to; 8. Philologus Hebræo-Græcus, 4to; 9. Notes on Jonas, Joel, Hosea, and other books. He also gave correct editions of several learned works.

LEUTMERITZ, a circle in the Austrian kingdom of Bohemia, extending over 1394 square miles, containing forty-two cities and towns, 942 villages, and 54,060 houses, inhabited by 300,711 individuals. It is a romantic district of hills, covered with wood, and narrow valleys of considerable natural fertility. The Elbe carries off the waters of the many small streams which run through the valleys. It is productive of corn, flax, hops, fruit, and yields some wine, and may be considered as a granary for part of the kingdom of Saxony. The capital, from which the circle derives its name, is a city situated on the Elbe, and surrounded with walls and ditches. It has a magnificent cathedral and eleven other churches, a town-hall, 565 houses, and 3950 inhabitants. Long. 13. 1. 33. E. Lat. 50. 31. 38. N.

LEUTSCHAU, a city of the circle of Zips, in the province of Hither Theiss, in Hungary. It is unfortified, and irregularly built, has a Catholic and a Lutheran church, and contains 866 houses, with 4340 inhabitants. It has much trade in brewing and distilling, and in wine, and is much frequented by pilgrims, who visit there an image of the Virgin Mary. Long. 20. 21. 5. E. Lat. 49. 0. 58. N.

LEUWENHOECK, ANTONY, a celebrated naturalist, was born at Delft in the year 1632, and died on the 26th of August 1723. The peculiar talent he displayed in cutting glasses for microscopes and spectacles at first procured him much reputation, owing to the superiority of the instruments he constructed; and he afterwards acquired still higher distinction as a naturalist and anatomist, by the variety of his researches on the internal structure of the different parts of the human body. His microscopical labours and observations were so numerous, that it would be impossible to give an exact detail of them; we shall, therefore, advert only to his principal researches. The antagonists of Harvey, author of the discovery of the circulation of the blood, objected to the doctrine of this great anatomist, that if the blood passed directly from the arteries to the veins, it could not nourish the parts it traversed. The question was undecided; and, in 1686, Leuwenhoeck com-

Leuwenhoeck.

municated to the Royal Society of London a memoir, in which, contrary to the opinion of Harvey, he maintained that the passage of the blood from the arteries to the veins was not immediate. Nevertheless, in 1690, having scrupulously re-examined the parts with his improved microscope, he discovered and demonstrated in the clearest manner the continuity of the arteries with the veins; and he even refused to admit any division between the capillary vessels, because, said he, it is impossible to determine where the arteries end and the veins begin. At this period, the chemical theory which prevailed in medicine assumed as certain the fermentation of the blood. Leuwenhoeck combated this hypothesis successfully, opposing to it his microscopic experiments, from which it results that there exist no bubbles of air in the blood-vessels, a phenomenon which ought to occur if the blood underwent fermentation. This experimenter having also directed his researches to the form of the globules of blood which Malpighi had already perceived, showed that these globules are oval and flattened, being composed of six small cones which float in the *serum*, and which, taken separately, do not reflect the red colour, but which, by their union, communicate to the blood the physical qualities it is known to possess. This discovery served as the basis of the theory of Boerhaave on inflammation. In order to support his system, Leuwenhoeck showed that the red capillary vessels proceed from other vessels, where the circulation of the blood takes place beyond the influence of the heart, and where this liquid appears white, because its globules are divided, in order to accommodate themselves to the tenuity of the canals through which it must pass. Ulterior experiments have not confirmed his ideas as to the physical composition of the blood; but his observations on the structure of the capillary vessels have been recognised as exact by the most enlightened anatomists. The brain and the nerves formed also subjects of research to Leuwenhoeck. He pretended that the cortical substance is entirely vascular; that the vessels which compose it are five hundred and twelve times smaller than the most attenuated capillary vessels; and that the globules composing the fluid contained in the cortical substance are thirty-six times smaller than those of which the red blood is formed. Lastly, he conceived that each of these globules is surrounded with a very fine reticulation of vessels and of fibres. But new experiments made in 1717 induced him to modify his ideas; and he then alleged that the brain is a fibrous structure, and that blood-vessels are intertwined amongst the fibres composing that organ. Science, however, has derived no advantage from these last researches, which are more fitted to perplex than to enlighten. Leuwenhoeck studied the structure of the crystalline lens, and described, with accuracy, the coats which compose this part of the organ of vision; adding very good figures to his description. Much has been said of the discovery of the animalcules which he perceived in the sperm. He described these minute bodies at great length, and conjectured that, having reached the uterus, they irritate that organ, attract the ovum, and communicate vitality to the embryon contained in it. Benjamin Martin has contested these observations, a detail of which may be found in the Natural History of Buffon. Leuwenhoeck employed his whole life, which was very long, in making anatomical observations and experiments; and he only wanted, to obtain more numerous results, that erudition and sagacity which are necessary to discern what is true from what is only apparent. It is thus that he often believed himself to have seen what did not exist, and that he persisted in his error. Amongst his paradoxes may be mentioned the opinion he supported, that the coat of the intestines, which the anatomists of his time called *tunica villosa*, is muscular. He also maintained that pulsation belonged to the veins, and not to the arteries. The Czar Peter the Great was an admirer of Leuwenhoeck. This prince, passing by Delft in 1698, sent two of his attendants to request Leuwenhoeck to pay him a visit, and to bring some of his "admirable" microscopes; adding, that he would have gone to visit him at his residence, had it not been that he wished to escape the notice of the multitude. The naturalist, after having showed his instruments to the emperor, exhibited to him the curious phenomenon of the circulation of blood in the tail of an eel. Leuwenhoeck communicated to the Royal Society of London all his Memoirs, which are inserted in the *Philosophical Transactions*. They have also been printed (for the most part separately) in Dutch, at Delft and at Leyden. But a foreign hand has translated into Latin all the compositions of this celebrated naturalist, under the title of *Arcana Naturæ detecta*, Delft, 1695–1699, in four vols. 4to; reprinted at Leyden in 1719, and with the author's correspondence in 1722.

LEUZE, a city of the Netherlands, in the province of Hennegau, and arrondissement of Tournay. It is situated on the river Dender, about six miles from its source, contains 4500 inhabitants, and has a considerable trade in linen. Long. 3. 33. E. Lat. 50. 34. N.

LEVANSO, an island in the Mediterranean Sea, near the western extremity of Sicily, four miles from Favignana. It is the Phorbantia of antiquity. It is nearly six miles in circumference, lofty, rugged, and, excepting at two or three places, inaccessible. It is inhabited, and furnishes corn, wine, oil, and cotton, and faggots and fire-wood, to the cities of Marsala and Trapani. Long. 12. 20. 29. E. Lat. 38. 1. 36. N.

LEVANT, in *Geography*, signifies any country situated to the eastward of us, or in the eastern part of any continent or country, or in that quarter where the sun rises.

LEVANT is also a name given to the eastern part of the Mediterranean Sea, bounded by Anatolia or Asia Minor on the north, by Syria and Palestine on the east, by Egypt and Barca on the south, and by the island of Candia and the rest of the Mediterranean on the west.

LEVEL, an instrument which enables us to find a line or surface exactly level; that is, such as shall be everywhere parallel to the true horizon, or at right angles to the plumb-line or direction of gravity. It also enables us to find the difference between the heights of two or more places on the surface of the earth.

Amongst the great variety of instruments which have been invented for these purposes, and which are all guided by the agency of gravitation, the following are the most important and useful.

Plumb-level.

Levels in which the plummet or plumb-line forms the most essential part have been constructed in many different forms, and under as many names, to suit the purpose or fancies of the various artificers who employ them; such as masons, bricklayers, paviors, carpenters, and others. But the general principle of the construction is to attach a thread and plummet to the upper part of a board or flat frame of wood or metal, in such a manner that, when the thread of this plummet, hanging freely, coincides with a fiducial line marked on the frame, it is at right angles to the base of the instrument; so that when this occurs, the thing to which the base is applied must obviously be level; but if the thread declines from the mark, the thing is lower on one side than the other. In some of these levels, the fiducial line or mark is at the middle of the base, in others at or near the end. But though it is easy to see, that the longer the base, and the farther down the thread the fiducial line extends, so much the more accurate or sensible is the instrument likely to be; yet little or no regard is generally had to this in practice. The vibrations of the lead, which are troublesome in nice operations, may be in a great measure prevented by having it immersed in a vessel with water or other liquor. Sometimes the plummet is enclosed in a glass cover to protect it from the agitation of the wind, and sights or even a telescope are occasionally applied. For a telescope may be added to any kind of level, by applying it upon or parallel to the base of the instrument when there is occasion to take the level of remote objects. One of the simplest forms of a plumb-level is shown in fig. 1, Plate CCCXXII.; and the next we shall describe is another.

The *Artillery Foot-Level* is in the form of a carpenter's square, having its two legs or branches of equal lengths; at their juncture is a little hole, whence hangs a thread and plummet playing on a quadrant, which is divided into twice forty-five degrees from the middle, as shown in fig. 2.

By placing the feet or ends of its two branches on a plane, in such a manner that the thread may play perpendicularly over the middle division of the quadrant, the plane is assuredly level. To use it in gunnery, place the two ends on the piece of artillery, which may be raised to any proposed height, as indicated by the plummet, whose thread will give the degree above the level.

Gunners' Level, for levelling cannons and mortars, consists of a triangular brass plate about four inches high (fig. 3), at the bottom of which is a portion of a circle, divided only into forty-five degrees, as this number is sufficient for the highest elevation of cannons and mortars, and for giving shot the greatest range. On the centre of a segment of a circle turns a piece of brass A B, which may be fixed by a screw at pleasure. Its lower end B serves for a plummet and index, to show the different degrees of elevation of pieces of artillery. This instrument has also a brass foot, not shown in the figure, to set upon cannons or mortars; so that when those pieces are horizontal, the instrument is perpendicular. The foot is to be placed on the piece to be elevated, in such a manner that the point of the plummet may fall on the proper degree; this they call *levelling the piece.*

The *Balance-Level* is wholly suspended as a pendulum. It is furnished with sights, which, when the instrument hangs at rest, show the line of level, and sometimes even a telescope is applied to it. Levels of this sort have been made in various forms. They have but little sensibility, and are liable to be sadly disturbed by the wind.

Desagulier's level, described at considerable length in almost every treatise on this subject, is essentially the same with the method of measuring heights by the barometer, to which, as a mode of levelling, we therefore beg to refer.

Reflecting Level, that made by means of a pretty long surface of water representing the same object inverted which we see erect by the eye; so that the point where these two objects appear to meet, is on a level with the place where the surface of the water is found.

There is another reflecting level, consisting of a mirror of steel, or the like, well polished, and placed a little before the object-glass of a telescope, suspended perpendicularly. This mirror must make an angle of 45° with the telescope, in which case the perpendicular line of the telescope is converted into a horizontal line, which is the same with the line of level.

Water-Level, that which shows the horizontal line by means of a surface of water or other liquor, founded on this principle, that a liquid always places itself level.

The most simple water-level is made of a long wooden trough or canal, whose sides are parallel to the base; so that, being equally filled with water, its surface shows the line of level. This is the chorobates of the ancients, described by Vitruvius.

It is also made with two cups fitted to the two ends of a pipe three or four feet long, about an inch in diameter, by means of which the water communicates from the one cup to the other; and this pipe being moveable on its stand by means of a ball and socket, when the two cups become equally full of water, their two surfaces mark the line of level.

This instrument, instead of cups, may also be made with two short cylinders of glass three or four inches long, fastened to each extreme of the pipe with wax or mastic. Into the pipe is poured some common or coloured water, which shows itself through the cylinders, by means of which the line of level is determined; the height of the water being the same in both cylinders, whether these are themselves perfectly level or not. This level, though very simple, is yet very commodious for levelling at small distances. Various instruments constructed on this principle with water, mercury, and other liquids, have aimed at great perfection; but, as refined levels, we consider them so inferior to the spirit-level, shortly to be noticed, as not to merit a particular description here.

Air-level.

Air-Level, that which shows the line of level by means of a bubble of air enclosed with some liquor in a glass tube which is slightly convex upward, and has its two ends hermetically sealed. When the bubble fixes itself at a certain mark in the middle of the tube, the plane or ruler whereon it is fixed is level. When it is not level, the bubble will rise to one end. This glass tube may be set in another of brass, or in a piece of wood, having an aperture in the middle, through which the bubble of air may be observed. The liquor with which the tube is filled is most commonly alcohol or spirit of wine. This application of a bubble of air is said to be the invention of Dr Hooke; but some ascribe it to Thevenot.

One of these instruments made with sights, is an improvement upon that last described, and, by a little additional apparatus, becomes more commodious and exact. It consists of an air-level AB (fig. 4), about eight inches long, and seven or eight lines in diameter, set in a brass tube 2, with an aperture in the middle C. The tubes are supported by a straight ruler a foot long, at whose end are fixed two sights, 3, 3, exactly perpendicular to the tubes, and of an equal height, having a square hole, subdivided by a cross of thin brass, in the middle of which is drilled a very small hole, through which a point on a level with the instrument is observed. The brass tube is fastened on the ruler by means of two screws, one of which, marked 4, serves to raise or depress the tube at pleasure, for bringing it towards a level. The top of the ball and socket is riveted to a little ruler that springs, one end whereof is fastened with a screw to the great ruler, and at the other end has a screw, 5, serving to raise and depress the instrument when nearly level.

We should consider wires greatly preferable to sights with holes, which, though very small, will take in too great a space to determine the point of level precisely. But the principle of the air-level is brought to an incomparably greater degree of perfection in the instrument next to be described.

Spirit-level.

Spirit-Level. The most accurate levelling instrument in use, and that possessed of the greatest essential advantages, is the spirit-level, which was first constructed by Mr Sisson, and to which various additions and improvements have been since made, particularly by Mr Ramsden. The following is a description of one of the best of these levels. Fig. 5 represents the instrument mounted on its staves, PQR. The telescope, AB, is made from fifteen inches to two feet in length, as may be required. It is achromatic, of the best kind, and shows the objects erect. By turning the screw *a* at the side of the telescope, the object-glass is moved; and thus the telescope is exactly adapted to the eye. In the focus of the eye-glasses are exceedingly fine cross wires, the intersection of which should be so perfectly in the axis of the tube, that by turning it round on its two supporters D, E, and looking through the telescope, the intersection of the wires may constantly cut the same part of the object viewed. They are easily adjusted to this state by means of the four screws *bbbb* placed on the telescope, near the end for the eye. These screws act in directions perpendicular to one another, so that, by unscrewing one and tightening the opposite one, the wire perpendicular to them may be moved either way at pleasure; and in this manner the other wire may be moved, and thus the intersection of the wires is brought exactly into the axis of the tube.

To the telescope is fixed, by two small screws, the level tube *cd*, containing the spirits, with a small bubble of air: this bubble, when the instrument is well adjusted, will settle exactly in the same place, in or near the middle of its tube, whether the telescope be reversed or not on the supporters, which in this case are kept unmoved. To render the level truly parallel to the telescope, the screw at *c* adjusts it vertically, and that at *d* horizontally. The two supporters D, E, on which the level rests and turns, are shaped like the letter Y. The telescope rests within the upper part of them; and the inner sides of each of these Y's are tangents to the cylindric tube of the telescope, which is turned to a true cylinder, and each side touches it only at one place. The telescope can be confined in the Y's by means of two jointed arches or rims, *ff*, which fasten with pins, *gg*, as shown in the figure.

The lower ends of these supporters are inserted into a strong brass bar F G, so as to stand perpendicularly on it. To one of these is applied a fine threaded screw, H, to adjust the tube, when on its supporters, to a true level; and to the same supporter D is sometimes applied a line of tangents as far as ten degrees, in order to take an angle of depression or elevation to that extent. Between the supporters is also sometimes fixed a compass-box I, divided into 360°, and again into four times 90°, having a centre pin and needle, and trigger to throw off the needle from the centre when not used; so as to constitute a perfect circumferentor, connected with all the foregoing improvements. This plate is fixed on a conical brass ferrule, which is adapted to the axis or bell-metal frustum of a cone at top of the brass head of the staves, having a ball and socket, with three bell-metal joints, two strong brass plates LL, four screws *eeee*, for adjusting the conical axis of the stand to be truly vertical, a regulating screw M to the motion on this axis, and a fastening screw N to tighten it on the cone when necessary. The fastening screw N, and the regulating screw M, by which the whole instrument is moved steadily round the vertical axis through a small space, were an addition of Mr Ramsden's. It is to be observed that, since the lower of the two plates LL generally partakes of the inclination of the ground, while the upper should always be level, they are almost never parallel, though usually called "the parallel plates."

Manner of adjusting the level at one station.

The whole level being now placed steadily on its staves, we must gradually adjust the axis of the stand to be truly vertical, if it is not so already. For this purpose the telescope must be placed in a line with two of the screws *e e*, and then levelled by these, if necessary, till the bubble of air in the spirit-tube keeps its position in the middle. It is next to be turned into a line with the other two screws *e e* at right angles to the former, and to be also levelled in that position.

The horizontal motion on the vertical axis being thus far adjusted, the rims *ff* of the Y's are to be opened, the telescope is to be taken off and laid the contrary way upon these supporters. If the bubble of air then rests exactly the same as before, the level and telescope are already adjusted rightly to one another; but if the bubble does not remain the same, the end to which it goes must be noticed, and its position altered; correcting the error partly by the screws *c*, *d*, and H, and partly by repeating the adjustments above described, upon the screws *eeee*.

The intersection of the wires being now directed to any distant object, it may be one of the vanes of the staves or poles hereafter described. (See LEVELLING *Staves.*) If they continue to be against it precisely, while the telescope is turned round its axis on its Y's, it proves, as before mentioned, that the axis coincides with the intersection of the wires. In this easy mode of adjustment consists the excellence of the instrument; for it is hereby capable of being adjusted by only one station and one object, which will at the same time determine it to be in a true level. If, by change of weather, accident, or other cause, the instrument should have lost its level or adjustment, it may thus be readily restored and re-adjusted at the first station; which is an advantage many levelling instruments do not possess.

Since it is often of great importance to execute levelling with accuracy, and the best instrument when out of its adjustment being of little use, it is quite necessary that every person using such an instrument should have it readily in his power to correct it; and the above, which is Ramsden's construction, is well adapted for this purpose. There are no doubt simpler instruments, as, for instance, some of Troughton's; but none of these simple ones admit of anything like such perfect adjustments as the one just described, though they may suit fully as well in the hands of a person not capable of making the adjustments, and of course not capable of taking a nice level at all.

Theory the spir level.

It is well known, that when a plummet or pendulum vibrates freely in a circular arc, the tendency of gravity to bring it to the resting position is everywhere as the sine of the angular distance from that position. Now, if the bubble in the spirit-level moves in a circle, it is obviously acted on by a force precisely similar to that which gravity exerts upon the plummet; and therefore it would seem that a spirit-level should measure small angles with the same accuracy as a sector whose radius is equal to that of the curvature of the glass tube, or a plumb-line of the same length; but there are some causes which diminish its accuracy. When the bubble of air has been brought to the middle of the glass tube, and when the tube, after being deranged, is restored to the very same position, we cannot be sure that the bubble of air will return to the very middle of the tube. This irregularity is produced by the friction of the included liquid against the sides of the tube, and depends on the magnitude of the bubble and the quantity of liquid. In a good level, where the bubble moves about five lines for a minute of inclination, this uncertainty does not exceed half a line, which may be ascertained by pointing the telescope to any object. The coincidence of a plumb-line with a particular mark will, on account of the insensible oscillation of the thread, leave about double the uncertainty which is left by the index of a sector, and which may be estimated at about a hundredth of a line. A variety of interesting researches on this subject by Mr Nixon will be found in the *Philosophical Magazine* for April and May 1827, March 1829, and June 1831.

Constr tion of rit-leve

Levels are commonly made of glass tubes in the state they are obtained at the glass-house. Of these, the straightest and most regular are selected and examined, by filling them nearly with spirit of wine, and ascertaining by trial that side at which the bubble moves most regularly, by equal inclinations of the instrument upon a stage called the bubble trier, which is provided with a micrometer screw for that purpose. The most regular side is chosen for the upper part of the instrument, the others being of little consequence to its perfection. Spirit of wine is used, because if pure it does not freeze at natural temperatures, and is more fluid than water. Sometimes, indeed, though very rarely, ether is employed. The tube and the bubble must be of considerable length. The longer the bubble, the more sensible it is to a small inclination. A very small bubble is scarcely sensible, appears as if attached to the glass, and moves but slowly.

In the use of a level of this kind constructed by Langlois, it was remarked, that when it was properly set in the cool of the morning, it was no longer so in the middle of the day, or when the weather became hot; and that when it was again rectified for the middle of the day, it became false in the evening, after the heat had diminished. The bubble was much longer in cold than in hot weather, and when longer it was too much so, and could not be kept in the middle of the tube, but stood a little on the one or the other side, though the inclination was precisely the same. These defects were small, and such as claim the notice of careful observers only; but they appeared of too much consequence not to produce a wish to remedy them. It was observed that they arose from inequalities in the interior surface of the tube; and by examining a great number of tubes, selected for levels of the same kind, there was reason to conclude that all these levels would have more or less of the same defects, because there was not one tube of a regular figure within. They were at best no otherwise cylindrical than plates of glass can be said to be plane before they are ground. The irregularities were easily discernible.

It was therefore concluded that it would be advisable to grind the inner surfaces of the tubes, and give them a regular cylindrical or rather spindle form, of which the two opposite sides should correspond with portions of circles of very long radius. To accomplish this, a rod of iron was taken of twice the length of the glass tube, and on the middle of this rod was fixed a stout tube of brass of the same length as the tube of glass, and nearly filling the bore. The rod was fixed between the centres of a lathe, and the glass gently rubbed on the brass cylinder, with fine emery and water, causing it to move through its whole length. The glass was held by the middle, that it might be equally ground, and was from time to time shifted on its axis, as was also the brass cylinder, in order that the wear might be everywhere alike. The operation had scarcely commenced before the tube broke; and several others experienced the same misfortune, though they had been well annealed. It was supposed that the emery which became fixed in the brass might contribute to split the glass, each grain continuing its impression with the same point, in a straight line, and in some instances might be disposed to cut the glass as diamond. Yet it is curious that some artists find a wooden cylinder to suit pretty well, probably because it does not hold the emery so firmly as brass does. But when a cylinder of glass was substituted instead of the brass, the emery, rolling on the surface of the glass instead of fixing itself, had better success; so that the tube and cylinder touched each other through their whole length. The same operation was continued, using finer and finer emery to smooth the tube, and prepare it for polishing; after which the tube and cylinder having been well washed, thin paper was pasted round the cylinder, and very equally covered with a small quantity of Venice tripoli. The tube was then replaced and rubbed as before, till it had acquired a polish.

A level thus ground may be either of the proper sensibility, or be too much or too little sensible. It will be too sluggish, if, before grinding, exclusive of the inequalities of the tube, its diameter in the middle of the length should much exceed the diameter of the extremities; or it will be too sensible if this diameter should not sufficiently exceed the other; or, lastly, if the middle diameter be smaller than that of the extremes, the bubble will be incapable of continuing in the middle, but will, in every case, either run to one or the other end, or be divided into two parts.

To correct these defects, and to give the instrument the required degree of perfection, it is proper to examine its figure before the grinding is entirely finished. For this purpose, after cleaning it well, a sufficient quantity of spirit of wine must be put into it, and secured by a cork at each end. The tube must then be placed on the forks or Y's of a bubble trier, and its sensibility, or the magnitude and regularity of the space run over by the bubble, by equal changes of the micrometer screw, must be ascertained. If the run or spaces passed over be too great, they may be rendered smaller by grinding the tube on a short cylinder; but if they be too short, they may, on the contrary, be enlarged, by grinding on a longer cylinder. It is necessary, therefore, to be provided with a number of these cylinders of the same diameter, but of different lengths, which it is advisable to bring to a first figure, by grinding them in a hollow half cylinder of brass. By means of these it will be easy to regulate the tube of the level to any required degree of sensibility, after which the tube may be very quickly smoothed and polished.

A level thus ground was one foot in length, and so was the cylinder on which it was first worked. When finished it was found to be too sensible. It was therefore worked on another cylinder between nine and ten inches long, which diminished its sensibility so far, that the bubble, which was nine inches and four lines long, at the temperature of 68° Fahrenheit, was carried from the middle of the tube exactly one line for every second of inclination. This sensibility was thought sufficient; but if greater is required, it may be obtained by the process here described. For more on this subject, we again beg to refer to Mr Nixon's papers already cited.

It may be remarked, that a glass tube is very subject to be split by grinding its inner surface; the same tube will not be endangered by grinding its external surface, even with coarse emery; and when once the polish of the inside is ground off, the danger is over, and coarser emery may be used with safety. Thick glass is more subject to this misfortune than thinner. The coarsest emery used in grinding the tube here spoken of was sufficiently fine to employ one minute in descending three inches in water.

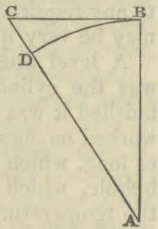
LEVELLING may be defined the art which enables us to find a line or surface exactly level, as also to find how much higher or lower any given point on the surface of the earth is than another.

The practice of levelling, therefore, consists, 1. in finding and marking two or more points that shall be on a level, as already defined; 2. in comparing the points thus found with other points, to ascertain the difference in their heights or levels, for the purpose of making roads, conducting water, draining low grounds, rendering rivers navigable, forming canals, and the like.

With regard to the theory of levelling, we must observe, that a plumb-line, hanging freely in the air, marks the direction of gravity, and a line drawn at right angles to the direction of the plumb-line, and touching the earth's surface, is a true level only on that particular spot; but if this line which crosses the plumb be continued for any considerable length, it will rise above the earth's surface, and the apparent level will be above the true one, because the earth is globular; and this rising will be as the square of the distance to which the said right line is produced; that is to say, it is raised eight inches very nearly above the earth's surface at one mile's distance; four times as much, or thirty-two inches, at the distance of two miles; nine times, or seventy-two inches, at the distance of three, &c. This is owing to the globular figure of the earth; and this rising is the difference betwixt the true and apparent levels; the curve of the earth being the true level, and the tangent to it the apparent level. Hence it appears, that the less distance we take betwixt any two stations, the truer will be our operations in levelling; and so soon does the difference between the true and apparent levels become perceptible, that it is necessary to make an allowance for it if the distance betwixt the two stations exceeds two chains.

Difference between the apparent and true level.

Let BD be a small portion of the earth's circumference, whose centre of curvature is A, and consequently all the points of this arch will be on a level. But a tangent BC meeting the vertical line AD in C, will be the apparent level at the point B; and therefore DC is the difference between the apparent and true level at the point B. The distance CD, therefore, must be deducted from the observed height, to have the true difference of level, or the difference between the distances of two points from the surface of the earth, or from the centre of curvature A. But we shall afterwards see how this correction may be avoided altogether in certain cases.



To find an expression for CD, we have (Euclid, iii. 36) $BC^2 = CD\,(2\,AD + CD)$. But since in all cases of levelling CD is exceedingly small compared with 2 AD, we may safely neglect CD^2, and then $BC^2 = 2\,AD \times CD$, or $CD = \frac{BC^2}{2\,AD}$. Hence the depression of the true level is equal to the square of the distance divided by twice the radius of the curvature of the earth. If we take the mean radius of the earth as the mean radius of its curvature, and consequently 2 AD = 7912 miles, then 5280 feet being one mile, we shall have CD the depression in inches $= \frac{5280 \times 12 \times BC^2}{7912} = 8{\cdot}008\ BC^2$. But when BC is in yards, the value of CD in inches becomes $\cdot 000002585\ BC^2$. From these data was computed the following

Table showing the Difference between the True and Apparent Levels, so far as depends on the Curvature of the Earth.

Distance.	Depression.	Distance.	Depression.	
Yards.	Inches.	Miles.	Feet.	Inches.
100	·026	·25		0·50
200	·103	·50		2·00
300	·233	·75		4·50
400	·414	1·		8·01
500	·646	2·	2	8·03
600	·931	3·	6	0·07
700	1·267	4·	10	8·13
800	1·654	5·	16	8·20
900	2·094	6·	24	0·29
1000	2·585	7·	32	8·39
1100	3·128	8·	42	8·51
1200	3·722	9·	54	0·65
1300	4·369	10·	66	8·80
1400	5·067	11·	80	8·97
1500	5·816	12·	96	1·15
1600	6·618	13·	112	9·35
1700	7·471	14·	130	9·57
1800	8·376	15·	150	1·80

A table sufficiently large to embrace every case, by simply taking proportional parts between its numbers, would occupy several pages; but the formula is of general application. However, when the distance is in miles, eight times its square will be very nearly the depression in inches, or two thirds of the same square the depression in feet. When the distance is in chains, a convenient rule for many ordinary purposes is to divide its square by 800; the quotient is very nearly the depression in inches. In this manner was computed the following table of the curvature of the earth:—

Distance.	Depression.	Distance.	Depression.
Chains.	Inches.	Chains.	Inches.
1	0·00125	27	0·91
2	0·00500	28	0·98
3	0·01125	29	1·05
4	0·020	30	1·12
5	0·031	31	1·20
6	0·045	32	1·27
7	0·061	33	1·35
8	0·080	34	1·44
9	0·101	35	1·53
10	0·125	36	1·62
11	0·150	37	1·71
12	0·180	38	1·80
13	0·211	39	1·90
14	0·24	40	2·00
15	0·28	45	2·53
16	0·32	50	3·12
17	0·36	55	3·78
18	0·40	60	4·50
19	0·45	65	5·28
20	0·50	70	6·12
21	0·55	75	7·03
22	0·60	80	8·00
23	0·66	85	9·03
24	0·72	90	10·12
25	0·78	95	11·28
26	0·84	100	12·50

The preceding formulæ and tables suppose the visual ray CB to be a straight line; whereas, on account of the unequal densities of the air at different distances from the earth, the rays of light are incurvated by refraction. The effect of this is to lessen the difference between the true and apparent levels, but in such an extremely variable and uncertain manner, that if any constant or fixed allowance is made for it in formulæ or tables, it will often lead to a greater error than what it was intended to obviate. For, though the refraction may at a mean compensate for about a seventh of the curvature of the earth, it sometimes exceeds a fifth, and at other times does not amount to a fifteenth. We have therefore made no allowance for refraction in these tables or formulæ; but we shall presently see how its effects may frequently be obviated.

Levelling is either simple or compound. The former is when the level points are determined from one station, whether the level be fixed at one of the points or between them. Compound levelling is nothing more than a repetition of many simple operations.

Simple levelling.

An example of simple levelling is given Plate CCCXXII. fig. 7, where A, B are the station-points of the level; C, D the two points ascertained. Let the height from A to C be six feet, and from B to D nine feet, the difference is three feet which B is lower than A.

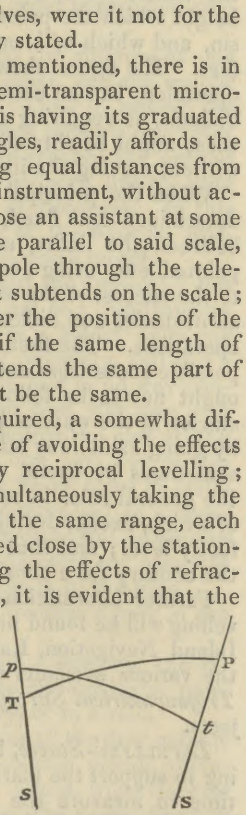
Had the station-points of the level been above the line of sight, and the distance from A to C been six feet, and from B to D nine feet, the difference would still have been three feet which B was higher than A.

But when the distance between the stations is considerable, we must provide for the effects of the curvature of the earth and of the refraction of the atmosphere. As to the former, it may be readily ascertained by the tables and formulæ given above, provided we know the distance; and we shall presently show how it may be frequently compensated for, or avoided altogether. But the refraction is so extremely variable, that it cannot be disposed of with the like certainty, though there are several ways in which its effects may often be avoided or compensated in a great measure along with those of curvature, as we shall now explain. If the levelling instrument, instead of being placed at the one station and directed to the other, were set either in the middle between or at equal distances from both stations, such instrument, properly adjusted, being directed first to the one station and then to the other, would, by means of the intersection of the wires, mark upon the poles at these stations two points, which would either be exactly on a level, or would differ only in a small degree, owing to some slight inequality in the refractions. For if, on account of the joint effects of curvature and refraction, the point observed on the one pole were, for example, six feet above the level of the instrument itself, the same must obviously hold of the point observed on the other pole, so far at least as the curvature of the earth is concerned; and unless the refraction be different on the different sides of the instrument (which may sometimes happen in a small degree), the points marked on the two poles must be on a level. In this way, it is obvious, that were it not for the figure of the earth being slightly spheroidal, the effect of curvature would be entirely avoided, and that of refraction very nearly.

Sometimes, in place of using two poles and one levelling instrument, two of the latter are employed simultaneously at equal distances from the same pole. In that case the difference in the heights of the points which they mark upon it should be equal to the difference in the heights of the instruments themselves, were it not for the source of slight inaccuracy already stated.

To facilitate the operations just mentioned, there is in the telescopes of some levels a semi-transparent micrometer scale instead of wires. This having its graduated edge crossing the axis at right angles, readily affords the means of approximately estimating equal distances from the stations or from the levelling instrument, without actual measurement. For this purpose an assistant at some distance holds up a pole so as to be parallel to said scale, while the observer, viewing the pole through the telescope, notices how many divisions it subtends on the scale; and, of course, in whatever manner the positions of the assistant or telescope are varied, if the same length of pole held parallel to the scale subtends the same part of it, the distance between them must be the same.

But where great accuracy is required, a somewhat different and greatly preferable mode of avoiding the effects of curvature and refraction is by reciprocal levelling; which consists in two observers simultaneously taking the levels from the opposite ends of the same range, each having a levelling instrument placed close by the station-pole of the other. Thus, supposing the effects of refraction to be alike in both directions, it is evident that the difference in the heights of telescopes placed horizontally at T and *t* must equal the difference in the heights of the points P and *p*, to which these telescopes are respectively directed on the opposite station-poles PS and *ps*; so that *p* is as much below the level of P as *t* is lower than T, and therefore P*t*—*p*T is double the difference in the levels of T and *t*, or of P and *p*. A great recommendation to this method is, that it does not require the distance between T and *t* to be known. But it readily affords the means of ascertaining the effect of refraction separately when the distance is known, because that is equal to the excess of the effect of the earth's curvature over the difference in the levels of T and P.



When the levelling instruments in the reciprocal method admit of their telescopes being elevated or depressed from a state of parallelism with the spirit-levels, and are likewise provided with the means of measuring such deviation; then, if each telescope be directed exactly to the other, the two angles which the axes of the telescopes make with the respective vertical lines, together with the horizontal angle (or that which these verticals form with each other), must obviously exceed 180° by the sum of the refractions in both directions. This, however, is more properly applicable to the mensuration of great differences of level by a trigonometrical process than to ordinary levelling. But neither this nor any other method yet known gives the exact values of the two refractions separately. It only gives their sum, still leaving some little uncertainty as to the separate or proper value of each refraction.

Compound levelling.

As an example of compound levelling, suppose it were required to know the difference of height between the points A and N, fig. 8. In this operation stakes or pegs should be driven down at A and N, nearly level with the surface; and should be so fixed, that they may not be changed until the whole operation is finished. A plan of the ground between the proposed points A and N should then be made, by which will be discovered the shortest way between them, and whence, too, the number of stations necessary to be taken will be determined. The operator will also be able to distribute them properly according to the nature and situation of the ground. In the figure twelve stations are marked. Stakes or pegs ought to be driven in at the limits of each station, as A, B, C, D, &c. They ought to be two or three inches above the ground, and driven firmly into it; but where rock occurs, it may be sufficient to make a mark on it. Stakes should also be driven in at each station of the instrument, as 1, 2, 3, 4, &c.

The operation may be begun in the following manner. Let the first station be at 1, equally distant from the two points A and B, which themselves are distant 166 yards. Write down then in one column the first limit A, with the number of feet, inches, and tenths, which the point of sight indicated on the station-staff at A, viz. seven feet six inches; in the second column, the second limit B, with the height indicated at the station-staff B, viz. six feet; lastly, in the third column, the distance from one station-staff to the other, which in this case is 166 yards. Remove now the level to the point marked 2, which is in the middle between B and C, the two places where the station-staves are to be held; observing that B, which was the second limit in the former operation, is the first in this. Then write down the observed heights as before; in the first column B with four feet six inches; in the second, C with five feet six inches $\frac{2}{10}$ths; in the third, 560 yards, the distance between B and C.

Should it be impossible, on account of the inequality of the ground at the third station, to place the instrument in the middle between the two station-staves, find the most convenient point, as at 3; then measure exactly how far this is from each station-staff, as, for instance, from 3 to C 160 yards; from 3 to D 80 yards; and the remainder of the operation will be as in the preceding station.

In the fourth operation, we must endeavour to compensate for any error which might have happened in the last, from the instrument not being in the middle between, or

Levelling.

at equal distances from the stations. Mark out, therefore, 80 yards from the station-staff D to the point 4, and 160 yards from 4 to E; and this must be carefully attended to, as by such compensations the work may be much facilitated. Proceed in the same manner with the eight remaining stations, observing to enter everything in its proper column. If all the ascents are not in one column by themselves, and all the descents in another, regard must be had to the proper signs of these quantities, which is rather more troublesome. And when the whole is finished, sum each column separately, and then subtract the less from the greater; the difference, which in the present case is 5 feet 4 inches $\frac{8}{10}$ths, shows the ground at N to be thus much lower than at A.

To obtain a section of this level, draw the dotted line O O, fig. 8, either above or below the plan, which may be taken for the level or horizontal line. Let fall then perpendiculars upon this line from all the station-points and places where the station-staves were fixed. Beginning now at A, set off 7 feet 6 inches upon the vertical line from A to *a;* for the height of the level point determined on the staff at this place, draw a line through *a* parallel to the dotted line OO, which will cut the third perpendicular at *b*, the second station-staff. Set off from this point downwards six feet to B, which shows the second limit of the first operation; and that the ground at B is one foot six inches higher than at A: place your instrument between these two lines at the height of the level line, and trace the ground according to its different heights. Now set off, on the second station-staff B, four feet six inches to C, the height determined by the level at the second station; and from C draw a line parallel to O O, which will cut the fifth perpendicular at *d*, the third station-staff. From this point set off five feet six inches $\frac{7}{10}$ths downwards to C, which will be our second limit with respect to the preceding one, and third with respect to the first. Then draw your instrument in the middle between B and C, and delineate the ground, with its inequalities. Proceed in the same manner from station to station, till you arrive at the last N, and you will have the profile of the ground over which the level was taken.

This method answers very well where only a general profile of the different stations is required; but where, for some special purpose, it is necessary to have an exact detail of the ground between the limits, we must go to work more particularly. Suppose, therefore, the level to have been taken from A to N by another route, but on more uniform ground, in order to form a canal. Draw at pleasure a line to represent the level, and regulate the rest; then let fall on this line perpendiculars to represent the staves at the limits of each station, taking care that they be fixed accurately at their respective distances from each other. The difference between the extreme limits in this case ought to be the same as in the former, viz. five feet four inches $\frac{8}{10}$ths. Set off this measure upon the perpendicular of the first limit; and from it, prolonging the perpendicular, mark off the height determined at the first station-staff. Do the same with the second and third, and so on with the rest, till this part of the work is finished; there remains then only to delineate in detail the ground between the station-staves. Sometimes a series of stakes is fixed in the ground, of such various lengths that all their tops are on a level. This, however, can only be done where the difference of level is small; and is used rather with the view of regulating some works to be executed or erected along the line, than for the mere purpose of levelling.

Fig. 9 gives an example of compound levelling, where the situation is so steep and mountainous, that the staves cannot be placed at equal distances from the instrument, or where it is even impossible to make a reciprocal levelling from one station to the other. Thus, suppose the point K to be the bottom of a basin where it is required to make a fountain, the reservoir being at A; so that, in order to know the height to which the jet d'eau will rise, it is necessary to know how much the point A is above K.

In great heights such as this, it will be necessary to proceed by small descents or ascents, as from A to B, or C. The instrument must be adjusted with all possible care; and it may even be proper, in some part of the work, to use a smaller instrument. The following is a table of the different operations used in making this level.

Ascents.			Descents.			Distances.
	Feet.	Inches.		Feet.	Inches.	Yards.
A	21	6	C	0	9	90
C	4	3	D	0	3	40
D	3	9	E	16	3	350
E	5	0	F	17	9	250
F	10	6	G	5	0	375
G	5	0	H	19	0	300
H	5	0	K	47	3	1000
	55	0		106	3	2405

In this case only two levellings are supposed to be made between A and D, though more were necessary; but they are omitted to avoid confusion. In the fourth station the height found was sixteen feet eight inches; but, on account of the great length, it was requisite to reduce the apparent level to the true one. At the last limit we get the height from *n* to *o;* then from *o* to I; from I to K; all which added together, and then corrected for the curvature, give forty-seven feet three inches. Now, by summing each column separately, and subtracting one from the other, we have fifty-one feet three inches for the height which the point A is above the bottom of the basin, and which will cause the jet d'eau to rise forty-five feet. The figure shows only the general section of this operation, but an exact profile of the mountain is more difficult, as requiring many operations; though some of these might be obtained by measuring from the level line without moving the instrument.

When the principal limits of the levelling have been determined and fixed, it only remains to find the level between the limits, according to the methods already pointed out, using every advantage that may contribute to the success of the work, and at the same time avoiding all obstacles and difficulties that may retard or injure the operations. The first rule is always to take the shortest possible route from one limit to another, though this rule ought not to be followed if there are considerable obstacles in the way, as hills, woods, marshy ground, or if, by going aside, any advantage can be obtained. It may sometimes be useful to deviate very considerably from the general rule, in order to take in ponds, the surfaces of which, except during storms, might all be taken as perfectly level; and thus levels are frequently taken across the country for a considerable way.

Farther information connected with the practice of levelling will be found under the articles relating to Canals, Inland Navigation, Railroads, Surveying, &c.; as also in the various accounts which have been published of the *Trigonometrical Survey*, and in other works on similar subjects.

Levelli
Staves

Levelling-Staves, instruments used in levelling, serving to support the marks to be observed, and at the same time to measure the heights of those marks from the ground. They usually consist of mahogany staves ten feet long, each being in two parts, which slide in upon one another to about $5\frac{5}{10}$ feet, for the more convenient carriage. They are divided into small equal parts, and numbered at every tenth division by 10, 20, 30, &c. as in figure 6; and on one side the feet and inches, or tenths, are also sometimes marked. These staves are likewise frequently called *levelling poles*, *station-poles*, or *station-staves.*

A vane A slides up and down each of these staves, and by brass springs will stand at any part. These vanes are about ten inches long and four inches broad; and are painted with stripes of white and black alternately. They have each a brass wire across a square hole in the centre, which serves to point out the height correctly, by coinciding with the horizontal wire of the telescope of the level.

LEVEN, the name of a river in Dumbartonshire, another in Fifeshire, and of a loch in Kinross-shire.

Leven, a town or large village of Scotland, on the coast of Fife. It consists of two principal streets, with numerous by-lanes and detached mansions. The staple trade of Leven is the weaving of linen goods, which employs a considerable number of workmen. There is also an iron foundery, a brick and tile work, and a pottery for coarse earthenware. The population may be estimated at 1500.

LEVER, in *Mechanics*, is a bar of iron or wood, one part of which being supported by a fulcrum, all other parts turn upon that as their centre of motion. This instrument is of two kinds. First, the common sort, where the weight which we desire to raise resting at one end, our strength is applied at the other, and the fulcrum is between both. When we stir up the fire with a poker, we make use of this lever; the poker is the lever, it rests upon one of the bars of the grate as a fulcrum, the incumbent fire is the weight to be overcome, and the other end held in the hand is the strength or power. In this, as in all the others, we have only to increase the distance between the strength and fulcrum, in order to give him who uses the instrument greater power.
